ERA
A Waters Company

1. The **Certified Value** is the actual "made-to" concentration confirmed by ERA analytical verification.

2. The stated **Uncertainty** is the total propagated uncertainty at the 95% confidence interval. The uncertainty is based on the preparation and internal analytical verification of the product by ERA, times a coverage factor which is equal to the student t factor at a 95% confidence interval at n-1 degrees of freedom.

3. The **QC Performance Acceptance Limits (QC PALs™)** are based on actual historical data collected in ERA's Proficiency Testing program. The **QC PALs™** reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the **QC PALs™** to realistically evaluate your performance against your peers.

4. The **PT Performance Acceptance Limits (PT PALs™)** are calculated using the regression equations and fixed acceptance criteria specified in the NELAC proficiency testing requirements. Use the **PT PALs™** when analyzing this QC standard alongside USEPA and NELAC compliant PT standards. Please note that many PT study acceptance limits are concentration dependent (some non-linearty) and, therefore, the acceptance limits of this QC standard and any PT standard may differ relative to their difference in concentrations.

5. The **Analytical Verification** data include the mean value, percent recovery and number of data points reported by the laboratories in our Proficiency Testing study compared to the Certified Values. In addition, where NIST Standard Reference Materials (SRMs) are available, each analyte has been analytically traced to the NIST SRM listed.

Traceability Recovery (%) = [(% recovery certified standard)/(% recovery NIST SRM)]*100

The traceability data shown were compiled by analyzing the ERA standards or their associated stock solutions against the applicable NIST SRMs.

6. This standard **expires 2/2012.** The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

If you have any questions or need technical assistance, please call ERA technical assistance at 1-800-372-0122 or email to info@eraqc.com.

Standard Reference Material 4288A
Technetium-99 Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive technetium-99, as potassium pertechnetate, and potassium hydroxide dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of beta-particle counting instruments and for the monitoring of radiochemical procedures.

Radiological Hazard

The SRM ampoule contains technetium-99 with a total activity of approximately 160 kBq. Technetium-99 decays by beta-particle emission. None of the beta particles escape from the SRM ampoule. During the decay process no photons are emitted. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. There is no detectable external radiation. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard

The SRM ampoule contains potassium hydroxide (KOH) with a concentration of 0.001 moles per liter of water. The solution is mildly corrosive and could represent a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2.

Storage and Handling

The SRM should be stored and used at a temperature between 5 and 65 °C. The solution is an unopened ampoule should remain stable and homogeneous until at least September 2006.

The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of the radioactivity.

Preparation

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, J.M.R. Hutchinson, Group Leader. The overall technical direction and physical measurements leading to certification were provided by L.L. Lucas of the Radioactivity Group.

The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by N.M. Trahey.

*Notes and references are on pages 5 and 6.

Recommended Procedure for Opening the SRM Ampoule

1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.

2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it.

3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.

4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.

5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.

6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.

7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.

8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.

9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss. See also reference [4]*.

NOTES

[a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.

Distance from Ampoule (cm):	1	30	100
Approximate Dose Rate (μSv/h):	<0.1		(Not detectable)

[b] The stated uncertainty is two times the standard uncertainty.

[c] Massic activity is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].

[d] The reported value, y, of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \ldots x_n)$, where f is a mathematical function derived from the assumed model of the measurement process.

The value, x_i, used for each input quantity i has a standard uncertainty, $u(x_i)$, that generates a corresponding uncertainty in y, $u_i(y) = |\partial y/\partial x_i| \cdot u(x_i)$, called a component of combined standard uncertainty of y.

The combined standard uncertainty of y, $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty.

The combined standard uncertainty is multiplied by a coverage factor of $k = 2$ to obtain U, the expanded uncertainty of y.

Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.

For further information on the expression of uncertainties, see references [2] and [3].

[e] The value of each standard uncertainty component, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the liquid-scintillation counting is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).

[f] Estimated limits of detection for photon-emitting impurities are:
$2 \times 10^{-4}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 20 and 85 keV,
$2 \times 10^{-5}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 93 and 503 keV,
$1 \times 10^{-5}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 519 and 1457 keV, and
$5 \times 10^{-6}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 1465 and 3250 keV.

[g] The stated uncertainty is the standard uncertainty. See reference [5].

[h] Relative standard uncertainty of the input quantity x_i.

[i] The relative change in the output quantity y divided by the relative change in the input quantity x_i. If $|\partial y/\partial x_i| \cdot (x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y. If $|\partial y/\partial x_i| \cdot (x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y.

[j] Relative component of combined standard uncertainty of output quantity y, rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y = |\partial y/\partial x_i| \cdot u(x_i)/y = |\partial y/\partial x_i| \cdot (x_i/y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i| \cdot (x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.

[k] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.

[m] $|\partial y/\partial x_i| \cdot (x_i/y) = |\lambda \cdot t|$, multiplied by other sensitivity factors where appropriate.

[n] The live time is determined by counting the pulses from a gated crystal-controlled oscillator.

[p] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y/\partial x_i| \cdot (x_i/y) = \{$(response per Bq of impurity)/(response per Bq of Tc-99)$\} \cdot \{$(Bq of impurity)/(Bq of Tc-99)$\}$. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

INORGANICS ANALYSIS

The Distribution Coefficients (K_d) for Tc-99 and Total Uranium (U) were determined using the following modification to ASTM C1733.

The contact solution was be prepared by spiking the client provided Tc-99 contaminated groundwater, which had been filtered through a Whatman #1810-125 acid treated TCLP filter, at 100 ppb Uranium. (Tc-99 groundwaters 749-WPW-06, 749-WPW-07, 749-WPW-08 were used). Only the minimum volume needed for the sample batch was prepared. Samples were weighted in duplicate for 5 time points (Day 7, Day 10, Day 14, Day 21 and Day X). The method specifies a 1:25 soil to contact solution test ratio; therefore, 200 mL of contact solution was added to 8 g of soil in a 250-mL Nalgene bottle. Samples were tumbled using the TCLP tumbler for 12-hours a day. For each time point, a 200 mL of the contact solution was added to an empty Nalgene and processed alongside the sample as a time point "Blank" for each Day n.

At each time point, the sample duplicates and time point "Blank" were filtered using a Whatman #1810-125 acid treated TCLP filter. The filtrate was preserved with nitric acid and stored for analysis. After the 4th time point (Day 21), all samples and "Blanks" were submitted for Tc-99 and total uranium analysis.

To calculate Kd in C1733, the following equation is used:

$$K_d = \frac{\frac{(C_s\, x\, V) - (C_f x\, V)}{m}}{C_f}$$

Where:
Cs = Starting Concentration of analyte of interest in contact solution
Cf = Final Concentration of analyte of interest in contact solution
V = Total Volume of contact liquid (mL)
m = Dry Mass of Solid (g)

For the purposes of this modified analysis at multiple time points, the concentrations of all "Blanks" analyzed were averaged and used as the starting concentration of the contact solution. The samples were not dried prior to the sample analysis; therefore, a percent solids was performed, and the results are reported on a dry weight basis. Therefore, following equation was used:

$$K_d = \frac{\frac{\left(C_{avg\ blk} x\, V\right) - (C_{day\,x}\, x\, V)}{m\, x\, \%\, soilds}}{C_{day\,x}}$$

Where:

Client: Fluor-B&W Portsmouth LLC
SDG: 474212
SwRI Project Number: 16526.05.00X
SwRI Task Order Number: 110830-12, 110831-5, 110901-7, 110902-3

$C_{avg\ blk}$ = average "Blank" concentration which represents the starting concentration of analyte of interest in contact solution
$C_{day\ x}$ = concentration of analyte of interest in contact solution at time point x
V = total volume of contact liquid (mL)
m = weight of Solid (g)

In addition to the K_d values, the propagated uncertainties were also calculated. The K_d values and the uncertainties for the sample duplicates were averaged for each time point. By evaluating these values, it was established when the Tc-99 and U sorption equilibrium had been reached. It was determined that all of the Tc-99 had reached equilibrium by Day 21. For the U, five samples were questionable whether or not equilibrium was reached by Day 21; therefore, Day X was analyzed for samples: SwRI ID# 474213, 474214, 474221, 474222 and 474340 on Day 32.

The final K_d value reported is an average of all K_d time points values once equilibrium was achieved. With the exception of the five samples with questionable U equilibrium, it appeared that equilibrium was reached by the first time point (Day 7) for all samples. Therefore, the final K_d and uncertainties values are the averages of Days 7-21. After evaluating the Kd values of Day X, it was determined that they did not statistically differ enough or did not trend in the correct direction compared to Day 7-21; therefore, the final K_d and uncertainties values are the averages of Days 7-X.

Per the method, "Often solid phase samples contain grains greater than 2mm in diameter. Since it is often assumed that these gravelsized grains have little or no sorption capacity, the Kd can be corrected to account for the presence of gravel. Kd values are determined as above on samples that have been sieved to remove gravel. The average gravel (greater than 2 mm) mass percentage of the material to be analyzed for Kd must be known or determined on a large mass (1 kg or more) to get representative percentage. The Kd that was determined on the <2 mm fraction is reduced by the mass fraction of gravel according to:"

$$K_{d\ corrected} = K_{<2,mm}(1 - f)$$

Where:
f = decimal mass fraction of gravel in the total sample.

SwRI #474213 contained 2.78%, 474214 contained 9.20% and 474401 contained 22.5% of large rocks that were removed from the sample prior to testing. The K_d value determined was then corrected for the mass fraction of gravelsized grains.

RADIOLOGICAL ANALYSIS

The sample SDG 474212 consisted of thirteen soil samples received for radiological analysis. The soil samples for radiological analysis were reported on an "as received" basis. The recommended sample holding time of six months was met.

The samples were analyzed for the following:

Matrix	Analysis	Method
Soil	^{99}Technetium	Liquid Scintillation Spectroscopy

^{99}Technetium

A 100ml aliquot of each sample fraction was analyzed for ^{99}Technetium. The sample aliquots were digested at 80°C for 4 hours with nitric acid and then one additional hour with hydrogen peroxide. The aliquots were then brought to a final volume of 50ml and then chemically separated using resins. A preparation blank and two laboratory control samples were analyzed with each sample batch. Each sample fraction was analyzed in duplicate.

For all liquid scintillation analysis, the daily instrument performance checks were within the running statistical control limits.

For ^{99}Tc analysis, the ^{99}Tc was separated from the digestion using chemical separation resins. After chemical separation, the resin containing the ^{99}Tc was placed into a liquid scintillation vial and 15 ml of scintillation cocktail was added. The samples were counted on a liquid scintillation counter programmed to count only the ^{99}Tc region of interest. The liquid scintillation counter ^{99}Tc program was standardized using ^{99}Tc as the radioisotope to establish a specific efficiency quench curve. A total of four preparation blanks and eight laboratory control samples were analyzed with the sample batches. All of the results for the preparation blanks were less than 1.65 times the TPU, the MDA, and the RL. The results for all of the laboratory control samples were within the recovery control limits of 75-125%. Each sample fraction was analyzed in duplicate and the sample duplicate evaluation ratio was less than three for all duplicates. A matrix spike and matrix spike duplicate were not performed with any of the analyses.

TOTAL URANIUM ANALYSIS

The acidified leachates were analyzed directly (no digestion was required) for total uranium by ICP-MS. All instrument QC criteria were met. The percent recoveries for the initial and continuing calibration verifications were within 90-110%. Total uranium was not detected above SwRI's reporting limit in the initial and continuing calibration blanks. The low level, CRI standard recoveries were within 50-150%. The percent recoveries for the interference check sample ICSABs were within 80-120%. The internal standard recoveries were within 80-120% for the ICV/CCV/ICB/CCBs and within 30-120% for all samples.

Instructions

FLUOR-B&W PORTSMOUTH LLC. SOW FXP02234L04. Project OSDC
SDG is 474212. SDG IS CLOSED.

28-day TAT HARDCOPY.
FINAL DATA/HARDCOPY IS DUE TO THE CLIENT ON 10/07/11.

24 overall SO/WQ samples (30 containers) received on 08/30/11 for SOW FXP02234L04. OUT of the 24 samples, only the 5 SOIL samples for DISTRIBUTION COEFFICIENT and the 2 WATER Tc99/U SPIKES are listed in this task order.

see SOW for full compound list, CRDLs and PLs:
ASTM C1733 Distribution Coefficients
Tc-99 LSC - Technetium-99 (to support ASTM C1733; see summary)
Total U by ICP-MS (to support ASTM C1733; see summary)

EDD REQUIRED. FORMS PLUS RAW DATA PACKAGE REQUIRED.

PROJECT DESCRIPTION _ Change Order #3 _ Characterization to Support Siting of On-Site Disposal Facility
ELECTRONIC DATA DELIVERABLE _ Electronic Deliverable (AMSED) uploaded into PEMS via the internet plus CD.
QC REQUIREMENTS _ Per ICPT BOA/QSAS and method requirements.

Instructions

FLUOR-B&W PORTSMOUTH LLC. SOW FXP02234L04. Project OSDC
SDG is 474212. SDG IS CLOSED.

GROUPED _ With samples in SDG 474212, located in Task Order # 110830-12, SRR 45547.

28-day TAT.
DATA/HARDCOPY IS DUE TO THE CLIENT ON 10/7/11.

6 overall SO samples (6 containers) received on 08/31/11 for SOW FXP02234L04.
OUT of the 6 samples, only the 3 SOIL samples for DISTRIBUTION COEFFICIENT are listed in this task order.

see SOW for full compound list, CRDLs and RLs:
ASTM C1733 Distribution Coefficients
Tc-99 LSC - Technetium-99 (to support ASTM C1733; see summary)
Total U by ICP-MS (to support ASTM C1733; see summary)

EDD REQUIRED. FORMS PLUS RAW DATA PACKAGE REQUIRED.

PROJECT DESCRIPTION _ Change Order #3 _ Characterization to Support Siting of On-Site Disposal Facility
ELECTRONIC DATA DELIVERABLE _ Electronic Deliverable (AMSED) uploaded into PEMS via the internet plus CD.
QC REQUIREMENTS _ Per ICPT BOA/QSAS and method requirements.
SMO representative is Jim Applegate James.Applegate@fbports.com; 740.897.4081

Instructions

FLUOR-B&W PORTSMOUTH LLC. SOW FXP02234L04. Project OSDC
SDG is 474212. SDG IS CLOSED.

GROUPED _ With SOIL samples in SDG 474212, located in Task Order # 110830-12, 110831-5, 110901-7, 110902-3.

FINAL DATA/HARDCOPY IS DUE TO THE CLIENT ON 11/29/11.

Groundwater Spiked sample 749-WPW-06 / 475064 was received on 09/15/11, located in SRR # 45654
Groundwater Spiked sample 749-WPW-07 / 475065 was received on 09/15/11, located in SRR # 45654
Groundwater Spiked sample 749-WPW-08 / 476734, Container No. 1 was received on 10/06/11, located in SRR # 45808

This task order was created with the sole purpose of listing/recording the actual ground water Tc99 spiked samples used with the Soil samples under SDG 474212 for DISTRIBUTION COEFFICIENT (Kd).

see SOW for full compound list, CRDLs and RLs:
ASTM C1733 Distribution Coefficients
Tc-99 LSC - Technetium-99 (to support ASTM C1733; see summary)
Total U by ICP-MS (to support ASTM C1733; see summary)

EDD REQUIRED. FORMS PLUS RAW DATA PACKAGE REQUIRED.

PROJECT DESCRIPTION _ Change Order #3 _ Characterization to Support Siting of On-Site Disposal Facility
ELECTRONIC DATA DELIVERABLE _ Electronic Deliverable (AMSED) uploaded into PEMS via the internet plus CD.
QC REQUIREMENTS _ Per ICPT BOA/QSAS and method requirements.

Notes: Day #10 results.

Southwest Research Institute, Division 1, Radiochemistry

LSC Bench Sheet

Tc-99

Client: Fluor-B&W Portsmouth
Task Order: 110830-12, 110831-5, 110901-7, 110902-3
Prep Page: 12-223
Prep Date: 18-Oct-11

Project #: 16526.05.00X
SRR: 45547, 45562, 45570, 45578
RL: 20 pCi/L
Units: L

TPU Factors	%
Aliquot Amount	2.00%
Standards	5.00%
Quench Curve	0.50%
Sub Sampling	2%
TPU of net Counts	5.77%

Sample Calculations
dpm = cpm / (eff-1 / 100) - avg bkg dpm
Activity pCi/g = dpm * DF / 2.22 (dpm to pCi)
TPU pCi/L =SQRT(Counting Error^2+ (systematic TPU% /100) ^2*Sample Activity^2)
MDC pCi/g = (4.65*SQRT((AVG(bkg cpm))/time)/((Eff / 100)*Sample Amt)/2.22+3/(Eff /100*Sample Amt* Time))/ 2.22
Counting Error = SQRT(cpm/time + bkg cpm/bkg time)/ Sample Amount / (Eff/100 * 2.22)
(RPD) = Abs Value(Sample-Duplicate) / ((Sample + Duplicate) / 2) * 100
Duplicate Evaluation = (Sample-Duplicate) / sqrt ((TPUsample^2) + (TPUdup^2)) ≤ 3

010067

Assay Definition

```
Assay Description:

Assay Type: DPM (Single)
Report Name: Report1
Output Data Path: C:\Packard\Tricarb\Results\Default\99tc_dpm\20111021_1202\Replay_20111024_092933
Raw Results Path: C:\Packard\Tricarb\Results\Default\99tc_dpm\20111021_1202\20111021_1202.results
Assay File Name: C:\Packard\TriCarb\Assays\99tc_dpm.lsa
```

Count Conditions

```
Nuclide: 99tc
   Quench Indicator: tSIE/AEC
   External Std Terminator (sec): 10 sec
   Pre-Count Delay (min): 0.00
Quench Set:
   Low Energy: 99Tc
Count Time (min): 60.00
Count Mode: Normal
Assay Count Cycles: 1          Repeat Sample Count: 1
#Vials/Sample: 1               Calculate % Reference: Off
```

Notes: Day #14 results.

Southwest Research Institute, Division 1, Radiochemistry

LSC Bench Sheet

Tc-99

Client: Fluor-B&W Portsmouth
Task Order: 110830-12, 110831-5, 110901-7, 110902-3
Prep Page: 12-238
Prep Date: 24-Oct-11

Project #: 16526.05.00X
SRR: 45547, 45562, 45570, 45578
RL: 20 pCi/L
Units: L

Sample Calculations

dpm = cpm / (eff-1 / 100) - avg bkg dpm
Activity pCi/g = dpm * DF / 2.22 (dpm to pCi)
TPU pCi/L =SQRT(Counting Error^2+ (systematic TPU% /100) ^2*Sample Activity^2)
MDC pCi/g = (4.65*SQRT((AVG(bkg cpm))/time)/((Eff / 100)*Sample Amt)/2.22+3/(Eff /100*Sample Amt* Time))/ 2.22
Counting Error = SQRT(cpm/time + bkg cpm/bkg time)/ Sample Amount / (Eff/100 * 2.22)
(RPD) = Abs Value(Sample-Duplicate) / ((Sample + Duplicate) / 2) * 100
Duplicate Evaluation = (Sample-Duplicate) / sqrt ((TPUsample^2) + (TPUdup^2)) ≤ 3

TPU Factors	%
Aliquot Amount	2.00%
Standards	5.00%
Quench Curve	0.50%
Sub Sampling	2%
TPU of net Counts	5.77%

Assay Definition

```
Assay Description:

Assay Type: DPM (Single)
Report Name: Report1
Output Data Path: C:\Packard\Tricarb\Results\Default\99tc_dpm\20111026_0915\Replay_20111027_181337
Raw Results Path: C:\Packard\Tricarb\Results\Default\99tc_dpm\20111026_0915\20111026_0915.results
Assay File Name: C:\Packard\TriCarb\Assays\99tc_dpm.lsa
```

Count Conditions

```
Nuclide: 99tc
   Quench Indicator: tSIE/AEC
   External Std Terminator (sec): 10 sec
   Pre-Count Delay (min): 0.00
Quench Set:
   Low Energy: 99Tc
Count Time (min): 60.00
Count Mode: Normal
Assay Count Cycles: 1          Repeat Sample Count: 1
#Vials/Sample: 1               Calculate % Reference: Off

Tc-99

Client: Fluor-B&W Portsmouth
Task Order: 110830-12, 110831-5, 110901-7, 110902-3
Prep Page: 12-243
Prep Date: 31-Oct-11

Project #: 16526.05.00X
SRR: 45547, 45562, 45570, 45578
RL: 20 pCi/L
Units: L

TPU Factors	%
Aliquot Amount	2.00%
Standards	5.00%
Quench Curve	0.50%
Sub Sampling	2%
TPU of net Counts	**5.77%**

Sample Calculations
dpm = cpm / (eff-1 / 100) - avg bkg dpm
Activity pCi/g = dpm * DF / 2.22 (dpm to pCi)
TPU pCi/L =SQRT(Counting Error^2+ (systematic TPU% /100) ^2*Sample Activity^2)
MDC pCi/g = (4.65*SQRT((AVG(bkg cpm))/time)/((Eff / 100)*Sample Amt)/2.22+3/(Eff /100*Sample Amt* Time))/ 2.22
Counting Error = SQRT(cpm/time + bkg cpm/bkg time)/ Sample Amount / (Eff/100 * 2.22)
(RPD) = Abs Value(Sample-Duplicate) / ((Sample + Duplicate) / 2) * 100
Duplicate Evaluation = (Sample-Duplicate) / sqrt ((TPUsample^2) + (TPUdup^2)) ≤ 3

ERA
A Waters Company

1. The **Certified Value** is the actual "made-to" concentration confirmed by ERA analytical verification.

2. The stated **Uncertainty** is the total propagated uncertainty at the 95% confidence interval. The uncertainty is based on the preparation and internal analytical verification of the product by ERA, multiplied by a coverage factor which is equal to the Student t factor at a 95% confidence interval at n-1 degrees of freedom. The uncertainty applies to the product as supplied and does not take into account any required or optional dilution and/or preparations the laboratory may perform while using this product.

3. The **QC Performance Acceptance Limits (QC PALs™)** are based on actual historical data collected in ERA's Proficiency Testing program. The **QC PALs™** reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the **QC PALs™** to realistically evaluate your performance against your peers.

4. The **PT Performance Acceptance Limits (PT PALs™)** are calculated using the regression equations and fixed acceptance criteria specified in the NELAC proficiency testing requirements. Use the **PT PALs™** when analyzing this QC standard alongside USEPA and NELAC compliant PT standards. Please note that many PT study acceptance limits are concentration dependent (some non-linearly) and, therefore, the acceptance limits of this QC standard and any PT standard may differ relative to their difference in concentrations.

5. The **Analytical Verification** data include the mean value, percent recovery and number of data points reported by the laboratories in our Proficiency Testing study compared to the Certified Values. In addition, where NIST Standard Reference Materials (SRMs) are available, each analyte has been analytically traced to the NIST SRM listed.

Traceability Recovery (%) = [(% recovery certified standard)/(% recovery NIST SRM)]*100

The traceability data shown were compiled by analyzing the ERA standards or their associated stock solutions against the applicable NIST SRMs.

6. This standard **expires 2/2013.** The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

If you have any questions or need technical assistance, please call ERA technical assistance at 1-800-372-0122 or email to info@eraqc.com.

Standard Reference Material 4288A
Technetium-99 Radioactivity Standard

DATE RECEIVED: 9/25/01
DATE EXPIRED: Sept 2006
DATE OPENED: 10/17/01
INMFG: 3082 PO: Clin Supply

This Standard Reference Material (SRM) consists of radioactive technetium-99, as potassium pertechnetate, and potassium hydroxide dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of beta-particle counting instruments and for the monitoring of radiochemical procedures.

Radiological Hazard

The SRM ampoule contains technetium-99 with a total activity of approximately 160 kBq. Technetium-99 decays by beta-particle emission. None of the beta particles escape from the SRM ampoule. During the decay process no photons are emitted. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. There is no detectable external radiation. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard

The SRM ampoule contains potassium hydroxide (KOH) with a concentration of 0.001 moles per liter of water. The solution is mildly corrosive and could represent a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2.

Storage and Handling

The SRM should be stored and used at a temperature between 5 and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least September 2006.

The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of the radioactivity.

Preparation

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, J.M.R. Hutchinson, Group Leader. The overall technical direction and physical measurements leading to certification were provided by L.L. Lucas of the Radioactivity Group.

The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by N.M. Trahey.

Gaithersburg, Maryland 20899

*Notes and references are on pages 5 and 6.

Recommended Procedure for Opening the SRM Ampoule

1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.

2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it.

3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.

4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.

5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.

6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.

7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.

8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.

9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss. See also reference [4]*.

*Notes and references are on pages 5 and 6.

NOTES

[a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.

Distance from Ampoule (cm):	1	30	100
Approximate Dose Rate (μSv/h):	<0.1		(Not detectable)

[b] The stated uncertainty is two times the standard uncertainty.

[c] Massic activity is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].

[d] The reported value, y, of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \ldots x_n)$, where f is a mathematical function derived from the assumed model of the measurement process.

The value, x_i, used for each input quantity i has a standard uncertainty, $u(x_i)$, that generates a corresponding uncertainty in y, $u_i(y) = |\partial y/\partial x_i| \cdot u(x_i)$, called a component of combined standard uncertainty of y.

The combined standard uncertainty of y, $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty.

The combined standard uncertainty is multiplied by a coverage factor of $k = 2$ to obtain U, the expanded uncertainty of y.

Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.

For further information on the expression of uncertainties, see references [2] and [3].

[e] The value of each standard uncertainty component, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the liquid-scintillation counting is approximately 30%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).

[f] Estimated limits of detection for photon-emitting impurities are:
$2 \times 10^{-4}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 20 and 85 keV,
$2 \times 10^{-5}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 93 and 503 keV,
$1 \times 10^{-5}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 519 and 1457 keV, and
$5 \times 10^{-4}\ \gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 1465 and 3250 keV.

[g] The stated uncertainty is the standard uncertainty. See reference [5].

[h] Relative standard uncertainty of the input quantity x_i.

[i] The relative change in the output quantity y divided by the relative change in the input quantity x_i. If $|\partial y/\partial x_i| \cdot (x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y. If $|\partial y/\partial x_i| \cdot (x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y.

[j] Relative component of combined standard uncertainty of output quantity y, rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y = |\partial y/\partial x_i| \cdot u(x_i)/y = |\partial y/\partial x_i| \cdot (x_i/y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i| \cdot (x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.

[k] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.

[m] $|\partial y/\partial x_i| \cdot (x_i/y) = |\lambda \cdot t|$, multiplied by other sensitivity factors where appropriate.

[n] The live time is determined by counting the pulses from a gated crystal-controlled oscillator.

[p] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i$ = 100%. $|\partial y/\partial x_i| \cdot (x_i/y)$ = {(response per Bq of impurity)/(response per Bq of Tc-99)}·{(Bq of impurity)/(Bq of Tc-99)}. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

INTRODUCTION

Four soil (SO) and six bedrock (BR) samples received under SOW FXP02234L04 were selected for additional analyses defined in Fluor Change Order No. 5, 6 and 7. Upon receipt, the samples were initially logged into SwRI's Laboratory Information Management System (LIMS) and were assigned to multiple sample receipt reports (SRR). The additional tests were assigned to two task orders (TO). Table 1 contains the sample information.

Table 1 Sample Information

SwRI System ID	Customer Sample ID	Date Received	SRR No.	TO No.	Matrix

EXPERIMENTAL

Whole Rock including LOI Majors

The samples were readied for analysis using three techniques. The first technique was a closed vessel digestion using concentrated nitric, hydrochloric and hydrofluoric acids (Prep Method "Rock"). Boron was reported from this digestion. The second technique was a lithium metaborate/tetraborate fusion (Prep Method "80/20 Fusion"). Aluminum, barium, calcium, chromium, iron, magnesium, manganese, silicon, titanium, vanadium (for samples on SwRI Task Order 111213-14), and zirconium were reported from this fusion technique. Some of the resulting fusion solutions contained residue. The residues were separated, dried, and fused with a mixture of lithium metaborate/tetraborate. Both preps were analyzed. Zirconium was detected in the initial 80/20 Fusion preps and in the 80/20 Fusion residue preps for one or more of the samples. Therefore, those reported results are the combinations (or sums) of the results obtained from both preps, and are identified as "Combined" in the Prep Method and Date Analyzed columns of the Sample Analysis Data Sheets. The third technique (Prep Method "Teflon") was performed using concentrated nitric, perchloric, hydrofluoric and hydrochloric acids in an open vessel. The resulting digestates contained residue. The residues were separated, dried, and fused with a lithium metaborate/tetraborate mixture. Both preps were analyzed. The remaining metals (plus vanadium for samples on SwRI Task Order 111109-3) were reported from either the Teflon digestion only or the combination of the two. Lanthanum, molybdenum, nickel, phosphorus, potassium, sodium, strontium, vanadium, yttrium, and zinc were detected in both the Teflon digestates and the Teflon residue fusions for one or more of the samples. Therefore, those reported results are the combinations (or sums) of the results obtained from both preps, and are identified as “Combined” in the Prep Method and Date Analyzed columns of the Sample Analysis Data Sheets which are located in Appendix A.

TIC/TOC (SW 846 9060M)

The samples were analyzed for total organic carbon (TOC) and total inorganic carbon (TIC) using a carbon analyzer following a modified SW 846 Method 9060. The analyzer combusts the sample in an oxygen atmosphere and converts the carbon to CO2 which is detected by non-dispersive infrared (NDIR). Initially, the sample is for total carbon (TC), which includes both TIC and TOC. Another fraction of the sample is treated with sulfurous acid to remove the TIC present and combusted to determine the amount of TOC. The amount of TIC is then determined by subtracting the TOC result from the TC result. Results can be found on the Sample Analysis Data Sheets in Appendix B.

Bulk Density and Particle Density

The bulk density and particle density were only determined on the four soil samples (SO). The Fluor project manager concurred that the bulk density and the particle density of the bedrocks could be calculated from the core data obtained during the sampling activities. The bulk density of the samples was determined from a direct mass per volume ratio using MOSA Chapter 13 as guidance, and the particle density was determined using the Pycnometer method as described in Chapter 14. Results can be found on the Sample Analysis Data Sheets in Appendix B.

Surface area

The surface area was determined using an automated analyzer utilizing the volumetric nitrogen sorption technique (BET) described in MOSA Chapter 16. Two of the bedrock sample appeared to be oil shale and had to be heated to 600 ^{o}C for several hours prior to the surface area analysis. Results can be found on the Sample Analysis Data Sheets in Appendix B.

Particle size

Particle size analysis was only conducted on the four soil samples (SO). The Fluor project manager concurred that particle size was not applicable to the bedrocks since they were received as core samples. Particle size analysis was performed using a laser diffraction particle size analyzer according to ASTM B822 *Standard Test Method for Particle Size Distribution of Metal Powders and Related Compounds by Light Scattering*. Due to the maximum particle size limitation of the instrument, the samples were sieved prior to the instrumental analysis. The sieves used were: 3/8 in, No. 4, No. 10 and No. 20 which correspond to 9525, 4750, 2000 and 850 micron. The fraction passing the No. 20 sieve was then analyzed by laser diffraction. The results from the particle size analyzer were corrected for the fraction passing the No. 20 and combined with the weight retained on each sieve to construct the particle size distribution graphs located in Appendix C.

Clay Mineralogy

Clay minerals were determined via X-ray diffraction (XRD) according to *Methods of Soil Analysis* (MOSA) Chapter 12. The samples were pretreated according to Chapter 5 to remove soluble salts, carbonates, organic matter, and free iron oxides prior to particle size separation. The clay fraction (<2 μm) was separated using the centrifugation. The clay fractions were exchange-saturated with magnesium (Mg) and potassium (K) prior to preparing glass plate oriented aggregate mounts for XRD analysis. To further aid in the identifications, the Mg-saturated clays were solvated with glycerol and the K-saturated mounts were heated to 550 ^{o}C for 2 hours then submitted for additional XRD analysis. In the Mg-saturated mounts, most of the samples showed peaks at d-spacings of approximately 14, 10 and 7.2 angstroms. These peaks correspond to Smectite, Vermiculite, Chlorite, Mica, Halloysite, Metahalloysite and Serpentine. Using the XRD criteria found in Table 12-1 and Figure 12-5 in MOSA Chapter 12, the process of elimination based on the d-spacing in the Mg-saturated mount in conjunction to the presence/absence or shifting of the peak in the Mg-saturated glycerol solvated, K-saturated, and heated K-saturated mounts was used to identify the clays present.

The peak at a d-spacing of 14 angstroms in the Mg saturated mount could be caused by Chlorite, Vermiculite, or Smectite. If the peak is due to Smectite, the peak shifts to 18 angstroms in the glycerol solvated Mg-saturated mount and 12 angstroms in the K-saturated mount. If the peak is due to Chlorite, it will neither shift in the Mg and K-saturated mounts. Lastly, the Vermiculite will not shift in the Mg-saturated mount but will shift to 10 angstroms in the K-saturated mount. The peak at a d-spacing of 10 angstroms in the Mg saturated mount could be caused by Halloysite or Mica (Illite). Halloysite is eliminated from consideration when the peak in the glycerol solvated Mg-saturated sample does not shift and the peak is still present in the K-saturated, 550^{o} C heated sample, indicative of Mica (Illite). The third diagnostic peak in the 7.1-7.5 angstrom region in the Mg-saturated mount could be caused by Serpentine, Kaolinite, Metahalloysite, or a second order peak from Chlorite. Metahalloysite is eliminated by the close agreement of the d-spacing to Kaolinite at 7.15 angstroms not closer to 7.5 angstroms for Metahalloysite in the Mg-saturated, glycerol solvated Mg and K-saturated sample mounts. Serpentine and Chlorite are eliminated from consideration by the fact that the peak disappears in the potassium saturated, 550^{o} C heated sample, indicative of Kaolinite not Serpentine or second order Chlorite.

Relative abundances of the identified clay minerals were calculated using the ratio of their respective peak heights from the Mg-saturated oriented mounts. Table 2 contains the approximate relative composition of each clay mineral. The individual oriented mount XRD patterns can be found in Appendix D.

Petrology (XRD/XRF/Microscopy)

To aid in the petrographic description of the samples, several techniques were used including: x-ray diffraction (XRD), energy dispersive spectrometry x-ray fluorescence (EDS-XRF) using a scanning electron microscope (SEM) and optical microscopy.

The bulk elemental composition of the samples was determined by EDS-XRF. The analysis limited to the first 10 to 100 micron depth of the material. The XRF only quantitates elements of atomic numbers greater than 11 (sodium and higher) and is normalized to 100% on a weight basis. The energy dispersive spectra with the quantitation table for each sample are located in Appendix E.

Bulk minerals and silt fraction minerals (5-200 μm) were determined via random mount x-ray diffraction (XRD). A small amount of each sample was carefully ground to a nominal 100-mesh particle size and analyzed utilizing a random mount orientation. The XRD spectrum obtained for each sample and XRD library pattern matches for the material are presented in Appendices F and G for the bulk sample and silt fractions, respectively. Table 2 contains approximate mineral composition of each fraction.

A petrographic microscope was used for the examination of the minerals present in the sand and silt fractions of each sample using MOSA Chapter 8 as guidance. The sand fraction consisted of particles greater than 200 mesh (74 micron) and the silt fraction consisted of the particles from 5 to 74 micron. Although the sample was fractionated into the sand and the silt, each fraction contained agglomerations of smaller particles. The grains were mounted onto glass slides using Canada Balsam and examined under crossed polarized light. A gypsum compensator plate was also inserted to aid in the identification. See Appendix H for the photomicrographs of the samples and Table 3 for a table of the primary minerals identified.

Table 2 Approximate Composition of Bulk, Silt and Clay Fractions

SwRI ID	Customer ID	Approximate Composition

Table 3 Petrographic Description from Microscopic Evaluation

Customer ID	Sand Fraction	Silt Fraction
WDSB02-07-24.5	Predominately quartz with 5-10% of a carbonate mineral (high birefringence). Agglomeration of irregular shaped quartz. Brown material coating agglomerates appear to be organic matter, however does not appear to be the "cement" in the agglomerated quartz.	Primarily quartz. Small amount of carbonate mineral (high birefringence). Also, some organic material coating particles and small agglomerates.
WDSB29-07-4.5	Primarily quartz with a small amount of garnet (pyrope)	Primarily small or irregular shaped quartz with a small amount of garnet (pyrope)
WDMW04B-07-BE10	Primarily large particle of smoother quartz, small amount of carbonate mineral.	Primarily large particle of smoother quartz with carbonate mineral.
WDMW04B-07-CU10	Mainly quartz. Some larger agglomerates made up of fine quartz particles. Organic materials coating some particles and agglomerates. Organic material also appears to be the binder in the agglomerates. Small amount of pyrope (isotropic) and carbonate mineral.	Primarily quartz. Small amount of pyrope (isotropic).
WDMW04B-07-SU10	Mainly Quartz. Large agglomerations of fine particles cemented with organic material.	Again, agglomeration of fine particles cemented with organic material. Bulk of particles is quartz but other material appears to be micas.
WDMW03B-07-BE10	Mainly quartz. Moderate amount of large flat carbonate minerals.	Primarily quartz with a small amount of a carbonate mineral.
WDMW03B-07-CU10	Mainly fine quartz particles with large agglomerates covered in organic material. Organic material appears to "glue" agglomerates	Predominately quartz with some agglomerates with an organic binder material
WDMW03B-07-SU10	Irregular shaped quartz with a significant amount of organic material binding agglomerates together.	Irregular shaped quartz. Also, a significant amount of agglomerates "cemented" by organic material.
WDSB31-07-2	Irregular shaped quartz. Flat plates of agglomerated quartz.	Irregular shaped quartz. Moderate amount of mica.
WDSB21-07-19.5	Mainly irregular shaped quartz and agglomerates of quartz particles.	Primarily quartz.

SwRI Task Order Number: 111109-3, 111213-14

METALS ANALYSIS

The samples were readied for analysis using three techniques. The first technique was a closed vessel digestion using concentrated nitric, hydrochloric and hydrofluoric acids (Prep Method "Rock"). Boron was reported from this digestion.

The second technique was a lithium metaborate/tetraborate fusion (Prep Method "80/20 Fusion"). Aluminum, barium, calcium, chromium, iron, magnesium, manganese, silicon, titanium, vanadium (for samples on SwRI Task Order 111213-14), and zirconium were reported from this fusion technique. Some of the resulting fusion solutions contained residue. The residues were separated, dried, and fused with a mixture of lithium metaborate/tetraborate. Both preps were analyzed. Zirconium was detected in the initial 80/20 Fusion preps and in the 80/20 Fusion residue preps for one or more of the samples. Therefore, those reported results are the combinations (or sums) of the results obtained from both preps, and are identified as "Combined" in the Prep Method and Date Analyzed columns of the Sample Analysis Data Sheets.

The third technique (Prep Method "Teflon") was performed using concentrated nitric, perchloric, hydrofluoric and hydrochloric acids in an open vessel. The resulting digestates contained residue. The residues were separated, dried, and fused with a lithium metaborate/tetraborate mixture. Both preps were analyzed. The remaining metals (plus vanadium for samples on SwRI Task Order 111109-3) were reported from either the Teflon digestion only or the combination of the two. Lanthanum, molybdenum, nickel, phosphorus, potassium, sodium, strontium, vanadium, yttrium, and zinc were detected in both the Teflon digestates and the Teflon residue fusions for one or more of the samples. Therefore, those reported results are the combinations (or sums) of the results obtained from both preps, and are identified as "Combined" in the Prep Method and Date Analyzed columns of the Sample Analysis Data Sheets.

All analytes were determined by ICP SW-846 Method 6010B. Also, any analyte sample concentration greater than 0.05% was converted and reported as an oxide. Loss on ignition (LOI) at 1000°C was determined. The reported "SUM" was calculated by adding any oxide concentrations and the LOI.

All instrument QC criteria were met. The percent recoveries were within 90-110% for the initial and continuing calibration verifications. No analytes were detected above SwRI's reporting limits in the initial and continuing calibration blanks. The CRDL standard recoveries for the spiked analytes were within 50-150%. The percent recoveries for the spiked analytes in the interference check samples ICSAB were within 80-120%.

Description of "Qualifier": "U" indicates that an analyte was not detected above SwRI's reporting limit. "N" indicates that the matrix spike and/or matrix spike duplicate recovery was not within 75-125%.

No analytes were detected in the Prep Blanks above SwRI's reporting limits. Two solid laboratory control samples (NIST SRM 278 Obsidian Rock and NIST SRM 688 Basalt Rock) were utilized

Client: Fluor - B&W Portsmouth LLC
SDG: 473757
SwRI Project Number: 16526.05.00X
SwRI Task Order Number: 111109-3, 111213-14

during the sample preparation techniques. The recoveries were within 80-120% for analytes with certified values with the exceptions of potassium (for Lab Control 2 – SRM 278 and Lab Control 8 – SRM 278), and lead (for Lab Control 3 – SRM 278). Please note that the lead SRM certified value is not greater than 10 times the reporting limit for Pb in the associated prep. For potassium, both SRM 278 Lab Controls were prepared with Teflon residue fusion batches. Since the residues are fused in their entirety, none remained to re-prepare. Aqueous laboratory control samples (Sample IDs: Lab Control, Lab Control 2, Lab Control 3) were also digested during the "Teflon" Prep Methods. The recoveries were within 80-120% for the spiked analytes.

SwRI system id 475584 was QC'd. The duplicate RPDs were less than 20%. Due to the nature of the sample preparation techniques utilized, matrix spikes were prepared during the "Teflon" Prep Methods only. The results are "N" flagged for arsenic, beryllium, cadmium, lead, selenium, silver, sodium, and zinc due to the MS and/or MSD recoveries not being within 75-125%. The MS/MSD recoveries were not within 75-125% for potassium and vanadium. However, the original sample results were greater than 4 times the spike added amounts, and are therefore not "N" flagged for K and V. Analytical spikes were performed and reported. The recoveries were within 75-125% for the spiked analytes.

"I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the laboratory manager or his/her designee, as verified by the following signature. This report shall not be reproduced except in full without the written approval of SwRI."

Appendix B

TIC/TOC, Bulk & Particle Density and Surface Area Results

Client: Fluor-B&W Portsmouth LLC
SDG: 473757
SwRI Project Number: 16526.05.00X
SwRI Task Order Number: 111109-3, 111213-14

Samples were analyzed for the following:

TIC/TOC – SW 846 9060M
Particle Density – MOSA Chapter 14M
Bulk Density – MOSA Chapter 13
BET Surface Area – MOSA Chapter 16

QC:

All applicable procedure blanks were less than the reporting limit, and all laboratory control samples were within 80-120%. Sample duplicate RPDs were within 20% with the exception of the TIC. The TIC's 200% RPD resulted from one result being less than the reporting limit and the other result was two times higher than the reporting limit. Matrix spike is only applicable to the TOC analysis; the recovery was 127%.

"I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the laboratory manager or his/her designee, as verified by the following signature. This report shall not be reproduced except in full without the written approval of SwRI."

OSDC AQUIFER PERFORMANCE TEST TECHNICAL MEMO

Section 1

Overview and Test Objectives

Fluor-B&W Portsmouth LLC (FBP) conducted aquifer testing at the proposed On Site Disposal Cell (OSDC) Area D adjacent to the Portsmouth Gaseous Diffusion Plant, located in Piketon, Ohio for the US Department of Energy (DOE). The testing consisted of single well yield tests and long-term, constant rate aquifer performance tests (CRTs).

The objectives of the testing were to:

- Determine the interconnectedness between the Berea Formation and any saturated portions of the stratigraphically higher Cuyahoga Formation.
- Estimate the hydraulic transmissivity and storativity (volume of water released from storage per unit decline in hydraulic head in the aquifer, per unit area of the aquifer) of the two-foot sandstone layer within the Cuyahoga Formation and any other saturated zones identified within the Cuyahoga Formation.

The information collected from the tests will be used to evaluate and characterize the proposed OSDC Study Area D hydrogeology and to help refine the site-wide numerical groundwater model.

The aquifer performance testing was conducted between the dates of June 7, 2012 and October 1, 2012.The testing consisted of five components:

- Background water level monitoring.
- Hydraulic communication testing to estimate the interconnectedness of the Cuyahoga and Berea Formations.
- Yield testing performed on open borehole Cuyahoga piezometers to estimate hydraulic characteristics of the Cuyahoga Formation.
- Yield testing performed on isolated zones within Cuyahoga piezometers to estimate hydraulic characteristics of the Cuyahoga Formation.
- Long term CRTs performed on isolated zones within Cuyahoga piezometers to estimate hydraulic characteristics of the Cuyahoga Formation.

Figure 1-1 shows the proposed OSDC Area D and the monitoring wells and piezometers used during the aquifer performance tests (APTs).

This page intentionally left blank.

Section 2

Test Methods

The APTs were composed of three components: background monitoring, yield testing, and long-term CRTs. The stratigraphic units of interest during performance of the APTs are introduced below.

2.1 Stratigraphic Units

In the vicinity of the OSDC, the Cuyahoga, Sunbury, and Bedford Formations are predominantly shales, while the Berea Formation is predominantly sandstone. This stratigraphy is described below, from oldest to youngest.

2.1.1 Bedford Shale

The Bedford Formation, commonly referred to as the Bedford Shale, is continuous beneath PORTS. It averages 100 feet in thickness, and consists of shale with thin interbeds and laminations of hard, gray, fine-grained sandstone and siltstone.

2.1.2 Berea Sandstone

The Berea Formation, commonly referred to as the Berea Sandstone overlies the Bedford Shale. In the proposed OSDC area, the Berea Sandstone is approximately 30 feet thick. The upper 10 to 15 feet of the Berea Formation is composed of a light-gray, hard, thickly bedded, fine-grained sandstone; the lower 5 to 20 feet of the formation has numerous interlayered shale and sandstone laminations, very similar to the underlying Bedford Formation.

2.1.3 Sunbury Shale

The Sunbury Shale is a competent black shale that averages about 15 to 20 feet in thickness beneath the proposed OSDC area.

2.1.4 Cuyahoga Shale

The Cuyahoga Formation, commonly referred to as the Cuyahoga Shale, is the uppermost bedrock formation in the proposed OSDC area. It is a moderately-hard, thinly-laminated shale with numerous sandstone laminations. It forms hills surrounding the facility but is not found beneath the industrial portion of PORTS.

A continuous two-foot sandstone layer occurs within the Cuyahoga Formation. Within the proposed OSDC Area D footprint, the two-foot sandstone layer dips gently to the southeast, at approximately five feet per thousand feet. In the southeastern portion, the sandstone layer is saturated and shows artesian condition. In the northwest portion of the proposed OSDC, the two-foot sandstone layer is higher and is not saturated.

2.2 Background Monitoring

Continuous water level measurements were collected with electronic data recorders at Berea monitoring wells and Cuyahoga piezometers. The Berea Formation monitoring wells were constructed within a borehole using an inner PVC casing, slotted screen, filter pack, and grout seal. Cuyahoga piezometers were constructed as open bedrock boreholes. The construction logs of the monitoring wells and piezometers are presented in Appendix A.

2.2.1 Rationale

Background monitoring was conducted to identify impacts on water levels from natural causes such as barometric pressure, precipitation, and anthropogenic causes such as groundwater withdrawal. Background water levels were collected at four Cuyahoga piezometers and four Berea wells for a period of six weeks. Several of the Cuyahoga piezometers responded weakly, if at all, to barometric fluctuation. As the Cuyahoga is a confined aquifer, piezometers installed in the Cuyahoga would be expected to respond efficiently to barometric pressure. Piezometers WD-PZ11C, WD-PZ13C, WD-PZ15C, WD-PZ16C, and WD-PZ17C did not respond to barometric fluctuations, raising doubts concerning the degree to which they are hydraulically connected to the Cuyahoga Formation. It is suspected that pronounced skin effects, related to well construction and development, may have compromised data from the non-responding wells. These concerns are explored further in Section 4.

WD-PZ09C and WD-PZ12C responded consistently to barometric fluctuations. WD-PZ09C was chosen as the Cuyahoga Formation background monitoring piezometer and WD-MW05B was chosen to monitor the Berea Formation. The location of the wells is shown in Figure 1-1.

2.2.2 Methods

Electronic water level transducers/recorders were placed in each well. After the water level stabilized, an initial water level measurement was collected with a water level indicator. This reference level was loaded into the transducer/recorder and documented in the field logbook and the data collection was initiated. Periodically, transducer measurements were verified using manual water measurements. Background monitoring hydrographs for the Cuyahoga piezometer and Berea well are included in Figures 2-1 and 2-2.

2.3 Hydraulic Communication Between Cuyahoga and Berea Formations

The degree of hydraulic interconnectedness between the Berea and Cuyahoga Formations was investigated by pumping the Berea Formation and monitoring the response, or absence of response, in the Cuyahoga Formation. Between June 26 and July 3, 2012 communication tests were conducted in each of the following four Berea wells, while water levels were monitored in each Berea well’s paired Cuyahoga piezometer:

- Pumped WD-MW03B and Monitored WD-PZ12C.
- Pumped WD-MW04B and Monitored WD-PZ13C.
- Pumped WD-MW05B and Monitored WD-PZ14C.
- Pumped WD-MW06B and Monitored WD-PZ11C.

2.3.1 Hydraulic Communication Testing Approach

Each test was started by pumping the Berea well at 0.1 gallons per minute (gpm). If the Berea well yield was sufficient (i.e., > 0.1 gpm), the test progressed by selecting additional pumping rates of increasing magnitude. If the Berea well yield was insufficient (i.e., <0.1 gpm), the Berea well was pumped dry and recharge was recorded.

2.3.2 Hydraulic Communication Testing Implementation

The testing was performed according to the following steps:

- A pressure transducer was deployed in the pumping well and the paired observation well. Initial water levels were collected using a hand meter and the transducers were referenced to this reading.
- A bladder pump was installed in the Berea well.
- Transducer data collection was initiated.
- Pumping was initiated at 0.1 gpm.
- Throughout the test, data were collected at both wells to determine the presence or absence of hydraulic communication between the two formations.

- If the Berea well sustained a 0.1 gpm discharge rate with stable drawdown over one hour, a higher pumping rate was initiated. Increasing pumping rates were implemented, until the well yield was exceeded.
- If a steady-state flow rate of 0.1 gpm could not be maintained during the test, the well was pumped dry, and the recovery of the well was recorded on the transducer. No Berea well produced 0.1 gpm.
- Recovery data were recorded as feet of recovery per time. The values were converted into volume per time to characterize the yield of the well.
- Water level data and calculations associated with the testing are presented in Figures 2-3 to 2-6.

2.4 Cuyahoga Formation Hydraulic Properties

Testing was performed between July 12, 2012 and Oct 1, 2012 to collect data that were used to estimate the hydraulic properties of the Cuyahoga Formation. The testing consisted of yield tests and long term CRTs. Where present, water levels were monitored in nearby Cuyahoga bedrock borings to provide additional data for the hydraulic property evaluation.

2.4.1 Yield Testing of Open Boreholes

Yield tests were initiated at the following six piezometers by placing a pump approximately two feet above the borehole bottom and pumping the entire borehole (i.e., no packers were used):

- Pumped WD-PZ11C and monitored WD-MW06B.
- Pumped WD-PZ13C and monitored WD-MW04B.
- Pumped WD-PZ14C and monitored WD-MW05B.
- Pumped WD-PZ15C and monitored SB67.
- Pumped WD-PZ16C and monitored SB57.
- Pumped WD-PZ17C and monitored SB53, SB54.

2.4.1.1 Approach to Yield Testing of Open Boreholes

Each test started with an initial pumping rate of 0.1 gpm and was intended to progress by selecting three additional pumping rates of increasing magnitude. Pumping rates progressed only if the Cuyahoga piezometer could sustain a 0.1 gpm discharge rate with stable drawdown over one hour. The flow rate at each subsequent pumping rate was selected based on the drawdown measured during the previous pumping step. The goal was to determine if the piezometer should receive subsequent testing of isolated zones. The nearby Berea well was monitored during testing of WD-PZ11C, WD-PZ13C, and WD-PZ14C to detect any evidence of hydraulic communication between the Cuyahoga and Berea Formations. In the case of WD-PZ15C, WD-PZ16C, and WD-PZ17C, the nearby Cuyahoga borings SB67, SB57, and SB53/SB54 were monitored in the expectation of detecting a hydraulic response that would provide an additional method for estimating a value for hydraulic conductivity for the Cuyahoga Formation.

2.4.1.2 Implementation of Yield Testing of Open Boreholes

The testing was performed according to the following steps:

- A pressure transducer was deployed in the pumping well and the paired observation point. Initial water levels were collected using a hand meter and the transducers were referenced to this reading.
- A bladder pump (WD-PZ11C, WD-PZ13C, and WD-PZ14C) or rotary impeller pump (WD-PZ15C, WD-PZ16C, and WD-PZ17C) was installed in the piezometer.
- Transducer data collection was initiated.

- Pumping was initiated at a rate of 0.1 gpm (WD-PZ11C, WD-PZ13C, and WD-PZ14C), as it was uncertain if the piezometers could sustain a 0.1 gpm discharge rate with stable drawdown over one hour.
- Pumping was initiated at a rate of 2 gpm (WD-PZ15C, WD-PZ16C, and WD-PZ17C), as groundwater sampling previously conducted at these piezometers had revealed well yields < 0.1 gpm.
- At WD-PZ09C and WD-PZ12C the open borehole could sustain a 0.1 gpm discharge rate with stable drawdown over one hour. At these piezometers, isolated zones within the borehole were subsequently tested, and as explained in Section 2.4.2.
- Piezometers WD-PZ15C, WD-PZ16C, and WD-PZ17C are co-located with a Cuyahoga bedrock boring located approximately 10 feet from the piezometer. At these three locations, water levels were recorded in both the pumped piezometer and the paired bedrock boring.
- Piezometers WD-PZ11C, WD-PZ13C, and WD-PZ14C are co-located with a Berea well located approximately 10 feet from the piezometer. At these three locations, water levels were recorded in both the pumped piezometer and the Berea well.
- Water level data and calculations associated with the yield testing in open boreholes are included in Figures 2-7 to 2-12.

The following quality control measures were taken.

- Manual water levels were collected from the isolated zone during each test to verify the electronic data.
- Flow rate was measured at the beginning of each pumping rate, periodically for the first 15 minutes, and at the end of each pumping rate to ensure a constant flow rate.
- For each pumping step, the discharge rate was confirmed using flow meter readings, totalizer readings divided by elapsed time, and timed filling of a graduated cylinder.

2.4.2 Yield Testing of Isolated Borehole Zones

Testing of isolated zones within the borehole was initiated at open boreholes that could sustain a 0.1 gpm discharge rate with stable drawdown over one hour. Isolated zones were selected prior to commencement of aquifer testing based on observations during drilling, water level response during groundwater sampling, as well as examination of geophysical logs. The selected pumping zones were:

- WD-PZ09C: 679-671 feet* (two-foot sandstone layer)
- WD-PZ09C: 671-636 feet (possible saturated zone below two-foot sandstone layer)
- WD-PZ12C: 749-709 feet (saturated zone above two-foot sandstone layer)
- WD-PZ12C: 710-679 feet (possible saturated zone above two-foot sandstone layer)
- WD-PZ12C: 712-681 feet (possible saturated zone above two-foot sandstone layer)
- WD-PZ12C: 678-663 feet (two-foot sandstone layer)

2.4.2.1 Approach behind Yield Testing of Isolated Borehole Zones

Each test started with an initial pumping rate of 0.1 gpm and was intended to progress by selecting three additional rates of increasing magnitude. Pumping rates progressed only if the isolated zone could sustain a 0.1 gpm discharge rate with stable drawdown over one hour. Each subsequent pumping rate was selected based on the drawdown measured during the previous pumping step. The goal was to have the third pumping rate match the maximum pumping rate sustainable during a long term CRT, and to exceed the zone’s yield during the fourth pumping rate. If a steady-state flow rate of 0.1 gpm could not be maintained, the zone was pumped dry and the recovery of the well was recorded using the transducers. These data were recorded as feet of recovery per time. The values were converted into volume per time to characterize the yield of the well.

2.4.2.2 Implementation of Yield Testing of Isolated Boreholes Zones

The testing was performed according to the following steps:

- The pneumatic packer assembly was configured so that the target zone could be isolated.
- The pneumatic packer assembly was lowered to the selected depth.
- In the case of a double packer assembly, one packer was placed just below the bottom of the target zone and the other packer above the target zone.
- In the case of a single packer assembly, one packer was placed either just below or just above the target zone.
- Transducers below, within, and above the isolated zone were referenced to the static water level.
- The hydraulic packers were inflated.
- Transducer data collection was initiated.
- Pumping was initiated.
- Drawdown recorded in zones above or below the target interval was interpreted to be a potential poor seal, and the packers were deflated and vertically adjusted to establish a better seal. The lithologic and geophysical logs were consulted to help minimize the magnitude of the vertical adjustment.
- If the zone could sustain a 0.1 gpm pumping rate with stable drawdown, over one hour, progressively higher pumping rates were initiated, followed by a long term CRT, as explained in Section 2.4.3.
- If a steady-state flow rate of 0.1 gpm could not be maintained, the zone was pumped dry, and the recovery of the well was recorded using the transducers. These data were recorded as feet of recovery per time. The values were converted into gpm to characterize the yield of the zone.

Water level data hydrographs and pumping rates are presented in Figures 2-13 to 2-18.

2.4.3 Constant Rate Yield Testing of Isolated Borehole Zones

A long term CRT was planned for each isolated zone that could sustain a 0.1 gpm discharge rate with stable drawdown. The goal was to collect data allowing an estimate of the hydraulic transmissivity and storativity within the Cuyahoga Formation. The selected pumping zones were:

- WD-PZ09C: 679-671 feet (containing the two-foot sandstone layer).
- WD-PZ12C: 678-663 feet (containing the two-foot sandstone layer).

2.4.3.1 Constant Rate Testing Approach

The isolated zones were pumped at a constant rate, which was selected based on the results of the step test. The objective was to stress the aquifer as much as possible, while maintaining a water level above the pump intake. Each test was terminated after 48 hours.

2.4.3.2 Constant Rate Testing Implementation

The testing was performed according to the following steps:

- The pneumatic packer assembly was configured so that the target zone could be isolated.
- The pneumatic packer assembly was lowered to the selected depth.

- One packer was placed just below the bottom of the target zone and the other packer above the target zone.
- Transducers below, within, and above the isolated zone were referenced to the static water level.
- The hydraulic packers were inflated.
- Transducer data collection was initiated.
- Pumping was initiated.
- Drawdown recorded in zones above or below the target interval was interpreted to be a potential poor seal, and the packers were deflated and vertically adjusted to establish a better seal. The lithologic and geophysical logs were consulted to help minimize the magnitude of the vertical adjustment.

Data Analysis and Results

The testing data were evaluated to identify any interconnectedness of the Cuyahoga and Berea Formations and to estimate the hydraulic properties within the two-foot sandstone layer and identified saturation zones within the Cuyahoga Formation. Evaluating background data supported the interconnectedness and hydraulic property evaluation.

3.1 Evaluation of Background Data

Background water levels were evaluated for Cuyahoga piezometer WD-PZ09C and Berea well WD-MW03B. The goal was to identify the cause of water level fluctuations (e.g. aquifer drainage, barometric response, aquifer pumping, earth tides, and precipitation influences) and to quantify any identified effects so that the effects can be removed from the CRT data, prior to hydraulic analysis.

3.1.1 Draining Influence

No long term declining or increasing trends in water level were noted in the hydrographs. This observation suggests drainage or recharge effects did not have a significant impact on CRT data.

3.1.2 Pumping Effects and Earth Tides

In the OSDC area, all wells are of the monitoring type, no pumping is performed, and no effects from pumping were expected. Water levels in aquifers may exhibit fluctuations due to changes in gravity caused by changes in the position of the sun and moon relative to the earth. These fluctuations are called earth tides. Earth tides are typically not observed in unconfined aquifers but can be detected in confined aquifers. Background monitoring hydrographs for WD-PZ09C and WD-MW05B show cyclic impacts in water levels on the order of 0.03 to 0.04 feet. These impacts can be attributed to earth tides. However, the magnitude of these effects was considered negligible during the data analysis.

3.1.3 Barometric Effects

When examining the background data, fluctuations in barometric pressure are identifiable as the major effect on the background water levels. The magnitude of the water level response to changes in barometric pressure is defined as the formation's barometric efficiency:

- If an aquifer is unaffected by changes in barometric pressure, then all of the change in water level measured at the borehole is due to atmospheric pressure fluctuations acting on the exposed borehole, not to changes in the aquifer water level. In this extreme case, barometric efficiency would be 100%.

- If an aquifer responds instantaneously to changes in barometric pressure, then all of the change in water level measured at the borehole is due to water level changes in the aquifer acting on the exposed borehole. None of the change in the borehole water level is due to change in barometric pressure acting on the exposed borehole. In this extreme case, the barometric efficiency would be 0%.

Barometric pressure data were collected using an onsite barometric transducer. These data were used to estimate the barometric pressure influence on the groundwater levels.

Cuyahoga piezometer WD-PZ09C and Berea well WD-MW03B exhibited water level fluctuations that correlated with changes in barometric pressure. Because the barometric effects were large relative to the induced drawdown, water elevation data were corrected for barometric effects. Curve-matching was employed using a range of barometric efficiencies to minimize the effects of barometric variation. Barometric efficiency is defined using the following equation.

Barometric efficiency = (average change in water level / average change in barometric pressure) x 100%

Overall, a barometric efficiency value of 90% provided the best fit. This value is high, which is consistent with an aquifer that is confined to a high degree. Figures 3-2 to 3-9 and 3-11 to 3-18 show hydrographs for locations monitored during the two CRTs including raw water levels, barometric readings, and water levels corrected for barometric effects.

3.2 Hydraulic Communication between Cuyahoga and Berea Formations

The degree of hydraulic interconnectedness between the Berea and Cuyahoga Formations was investigated by pumping the following Berea Formation piezometers and monitoring the response, or absence of response, in the following Cuyahoga Formation monitoring wells, located at a lateral distance of approximately 10 feet:

- Pumped WD-MW03B and Monitored WD-PZ12C
- Pumped WD-MW04B and Monitored WD-PZ13C
- Pumped WD-MW05B and Monitored WD-PZ14C
- Pumped WD-MW06B and Monitored WD-PZ11C

None of the Berea wells could maintain a pumping rate of 0.1 gpm with steady state drawdown. As a result, each borehole was pumped dry and the recharge was recorded. Notable in the hydrographs is the absence of response of the water level in the Cuyahoga piezometer to pumping in the Berea well. This lack of response suggests little to no hydraulic communication between the Cuyahoga Formation and the Berea Formation.

To estimate the yield of wells, recovery was recorded using transducers. These data were recorded as feet of recovery per time. The values were converted into gpm. These values were converted into recharge rates ranging from 0.008 gpm at WD-MW05B to 0.02 gpm at WD-MW06B.

Well ID	Total Draw-down	90% Recovery		50% Recovery	
		Volume	Rate	Volume	Rate
WD-MW03B	21.99 ft	19.79 ft x 0.163 gal/ft* = 3.2 gal	3.23 gal / 306 min = 0.01 gpm	Not Applicable**	Not Applicable**
WD-MW04B	15.98 ft	14.38 ft x 0.163 gal/ft = 2.34 gal	2.3 gal / 273 min = 0.009 gpm	7.99 ft x 0.163 gal/ft = 1.3 gal	1.3 gal / 95 min = 0.01 gpm
WD-MW05B	16.58 ft	14.92 ft x 0.163 gal/ft = 2.4 gal	2.4 gal / 310 min = 0.008 gpm	8.29 ft x 0.163 gal/ft = 1.4 gal	1.4 gal / 86 min = 0.02 gpm
WD-MW06B	18.38 ft	16.54 ft x 0.163 gal/ft = 2.7 gal	2.7 gal / 140 min = 0.02 gpm	9.19 ft x 0.163 gal/ft = 1.5 gal	1.5 gal / 47 min = 0.03 gpm

*0.163 gallons per foot of depth in a 2-inch well.

**Recharge rate not estimated. 50% recovery was achieved before data logger began recording.

3.3 Hydraulic Properties of Low-Yielding Saturated Zones Identified within the Cuyahoga Formation

Only two zones (WD-PZ09C: 679-671 feet and WD-PZ12C: 678-663 feet) could maintain a pumping rate of > 0.1 gpm. The following piezometers or isolated zones within piezometers could not maintain a pumping rate of 0.1 gpm:

- WD-PZ09C (671-636 feet)
- WD-PZ11C (Entire borehole)
- WD-PZ12C (749-709 feet and 712-681 feet)
- WD-PZ13C (Entire borehole)
- WD-PZ14C (Entire borehole)
- WD-PZ15C (Entire borehole)
- WD-PZ16C (Entire borehole)
- WD-PZ17C (Entire borehole)

At each low-yielding zone, the borehole or isolated zone was pumped dry, and recharge was recorded. The time required to recover a percentage of the applied drawdown was measured and converted into gpm. These values were used to estimate the yield of the well. The yield ranged from 0.0007 gpm at WD-PZ15C to 0.05 gpm at WD-PZ13C.

Well ID	Total Draw-down	90% Recovery		50% Recovery	
		Volume	Rate	Volume	Rate
WD-PZ11C	12.17 ft	10.95 ft x 1.47 gal/ft* = 16.1 gal	16.1 gal / 649 min = 0.03 gallons per minute (gpm)	6.09 ft x 1.47 gal/ft = 8.9 gal	8.9 gal / 244 min = 0.04 gpm
WD-PZ13C	20.46 ft	Not Applicable**	Not Applicable**	10.23 ft x 1.47 gal/ft = 15.0 gal	15.0 gal / 334 min = 0.05 gpm
WD-PZ14C	19.97 ft	17.97 ft x 1.47 gal/ft = 26.4 gal	26.4 gal / 11,165 min = 0.002 gpm	9.99 ft x 1.47 gal/ft = 14.7 gal	14.7 gal / 4,502 min = 0.003 gpm
		Recovery		Volume	Rate
WD-PZ15C	28.92 ft	13%		4.0 ft x 1.47 gal/ft = 5.9 gal	5.9 gal / 8600 min = 0.0007 gpm
WD-PZ16C	11.02 ft	50%		5.5 ft x 1.47 gal/ft = 8.1 gal	8.1 gal / 8,299 min = 0.001 gpm
WD-PZ17C	18.09 ft	33%		6.0 ft x 1.47 gal/ft = 8.8 gal	8.8 gal /8600 min = 0.001 gpm

*1.47 gallons per foot of depth in 6-inch well

**Recharge rate could not be estimated. 50% recovery was achieved before data logger began recording.

Notable in the hydrographs for WD-PZ15C, WD-PZ16C, and WD-PZ17C is the absence of hydraulic response recorded at the nearby Cuyahoga bedrock boring. Also notable is that the recovery data are highly linear. The linearity of the recovery data is uncharacteristic of a standard aquifer response. Poor hydraulic communication between the piezometer and the saturated formation may also play a role in the atypical recovery.

Poor hydraulic communication between piezometer and formation can be thought of in terms of a skin effect. The concept of a wellbore skin is used to account for the difference between measured and predicted response in a pumping well. A positive skin, resulting from reduced permeability near the wellbore, is caused by damage to the interface between the aquifer and the wellbore. To evaluate the skin effect at WD-PZ15C, WD-PZ16C, and WD-PZ17C, basic assumptions were made concerning the dimensions of the skin. These assumptions, combined with recovery data from WD-PZ15C, WD-PZ16C, and WD-PZ17C, were input into Darcy's Law to get a sense of the skin effect. Darcy's Law describes the following relationship:

Darcy's Law $Q = Kia$

Rearranging $K = Q/ia$

Q = discharge (volume /time)
K = hydraulic conductivity (length/time)
i = gradient (unitless)
a = cross sectional area (length^2)

The skin effect was assumed to extend outward from the borehole to a radius of 1.5 ft. Beyond this radius, the head in the formation was assumed to be unaffected by evacuating the piezometer. The cross-sectional area was assumed to be the height of the two-foot sandstone layer multiplied by the diameter of the extent of the skin effect. Q was assumed to be the measured recovery rate at each piezometer.

K = Q/ia

Well ID	**Q (ft^3/day)**	**Drawdown (ft)**	**Skin Radius (ft)**	**i**	**a (ft^2)**	**K (ft/day)**
WD-PZ15C	0.131	28.92	1.5	19.3	6	1 X 10^{-3}
WD-PZ16C	0.196	11.02	1.5	7.3	6	4 X 10^{-3}
WD-PZ17C	0.196	18.09	1.5	12.1	6	3 X 10^{-3}

Using this method, estimating the hydraulic conductivity of the skin effect is dependent on the estimated radial distance to which the skin effect extends. During advancement of the borehole drilling fluids containing naturally occurring clay particles (pulverized shale) enter the aquifer. Permeable zones are most easily penetrated by the clay-containing drilling fluids, and their effects can extend out from the borehole several feet. A radial distance of 1.5 feet was chosen as a conservative estimate for the penetration depth of drilling fluids.

The conductivities estimated for the well skin are higher than the horizontal hydraulic conductivity included in the site-wide groundwater numerical model for the Cuyahoga Formation (7 X 10^{-5} feet/day). It is uncertain whether the hydraulic testing simply measured a skin effect, and the true hydraulic conductivity in these areas is much greater than 10^{-3} ft/day. Alternatively, the skin effect may be negligible, in which case the testing has measuring the true hydraulic conductivity. This issue is discussed in further detail in Section 4.

3.4 Hydraulic Properties Based on Testing of the Two-Foot Sandstone Layer Higher-Yielding Saturated Zones Identified in the Cuyahoga Formation

During the two Cuyahoga Formation CRTs, while pumping WD-PZ09C, a water level response was recorded at WD-PZ12C and at no other location. Similarly, while pumping WD-PZ12C, a water level response was recorded at WD-PZ09C and at no other location. The data collected at WD-PZ09C and WD-PZ12C responded to barometric pressure in an instantaneous and consistent manner, allowing the barometric effects to be easily removed. The underlying response to pumping was found to be similar to the type curve for confined response to pumping. As a consequence, during pumping of WD-PZ09C and WD-PZ12C, the data collected at observation wells WD-PZ12C and WD-PZ09C, respectively, were evaluated to estimate the hydraulic characteristics of the two-foot sandstone within the Cuyahoga Formation.

3.4.1 General Conditions of the Two-Foot Sandstone Layer in Higher-Yielding Parts of the Cuyahoga Formation

Based on the hydrolithology of the two-foot sandstone layer and the observation that water levels within the Cuyahoga piezometers rise above the two-foot sandstone layer, hydraulic conditions within the two-foot sandstone layer are likely semi-confined or confined. Therefore, hydraulic response was evaluated using solutions for semi-confined and confined aquifer conditions. It was found that curve matches were best using the confined solution. The close match between recorded data and the confined aquifer type curve, the potentiometric surface that rises above the saturated zone, and the high degree of barometric efficiency exhibited by the Cuyahoga piezometers are each consistent with confined conditions within the two-foot sandstone layer.

Transmissivity and storage coefficients were estimated using a solution for confined aquifer conditions (Theis, 1935). The Theis solution was chosen since it is commonly used for test evaluations when site conditions meet, to a reasonable extent, solution assumptions. As with all field conditions, Cuyahoga Formation conditions do not exactly match the Theis solution requirements (Kruseman, G.P. and N.A. de Ridder 1990). For example, one solution assumption is that the aquifer must be homogeneous and isotropic. The Cuyahoga Formation at Proposed OSDC Area D is a low permeability shale that includes a transmissive two-foot sandstone layer. The tested formation is heterogeneous and anisotropic.

3.4.2 Hydraulic Properties of the Two-Foot Sandstone Layer in Higher-Yielding Parts of the Cuyahoga Formation

The curves are presented as Figures 3-19 and 3-20 and show range of transmissivity from 80 ft^2/day (using data from observation well WD-PZ09C) to 100 ft^2/day (using data from observation well WD-PZ12C) and a range of storativity from $3 X 10^{-4}$ to $5 X 10^{-4}$. Dividing the average transmissivity determined during curve matching by the aquifer thickness of two feet, the resulting hydraulic conductivity range is 40 to 50 ft/day.

3.4.3 Absence of Berea Formation Response to Pumping in Higher-Yielding Parts of the Cuyahoga Formation during the CRTs

Berea well hydrographs collected during the Cuyahoga CRTs record no reaction to pumping in the Cuyahoga Formation (Figures 3-6 to 3-9 and 3-15 to 3-18). In addition to testing designed specifically to estimate the interconnectedness, as described in Section 3.2, the absence of response in the Berea Formation during performance of CRTs within the Cuyahoga Formation is an additional indicator that the two formations have little to no hydraulic communication.

This page intentionally left blank

Section 4

Conclusions and Recommendations

Two CRTs were performed during the aquifer performance testing. The CRTs were performed by pumping piezometers WD-PZ09C and WD-PZ12C, which are located within or near the south central portion of proposed OSDC Area D. Hydraulic properties estimated from the CRTs are applicable to the vicinity of the southeastern portion of proposed OSDC Area D. In the central and northwestern portions of the Proposed OSDC Area D, it was not possible to perform CRTs, due to low-yielding Cuyahoga piezometers. In the central and northwestern portions of the Proposed OSDC Area D, observations of hydraulic performance were based solely on stressing and measuring response at single piezometers (i.e., no observation well data were suitable for use). As will be discussed in the sections below, the single piezometer data are suspect, due to concerns surrounding the degree of communication between the piezometer and the two-foot sandstone layer.

Within or near the south central portion of proposed OSDC Area, testing provided strong indications that the conditions within the two-foot sandstone layer are confined:

- The hydrolithology of the two-foot sandstone layer (underlain and overlain by low conductivity shale).
- The low estimated storativity of the two-foot sandstone layer.
- Observed water level elevations rising above the two-foot sandstone layer.
- The estimated 90% barometric efficiency of the two higher-yielding Cuyahoga piezometers. High barometric efficiency is consistent with confined conditions.
- The close match between CRT response hydrographs for the two higher-yielding Cuyahoga piezometers and the confined aquifer type curve.

Using confined aquifer type curve matching, the hydraulic conductivity of the two-foot sandstone layer was estimated to be in the range is 40 to 50 ft/day with storativity from 3×10^{-4} to 5×10^{-4}. In addition, hydraulic communication testing indicated no hydraulic communication between the Cuyahoga and Berea Formations.

4.1 Lithology and Hydraulic Properties of the Two-Foot Sandstone Layer in Low-Yielding and Higher-Yielding Parts of the Cuyahoga Formation

Lithologic logs completed for borings in Proposed OSDC Area D contain descriptions of the two-foot sandstone layer that are notably similar from location to location. The recurring description is of hard, sound, fresh, grey, very fine to fine sandstone. At widely separated locations, the two-foot sandstone layer is under roughly equivalent piezometric head. Static water levels were between six and nine feet above the top of the two-foot sandstone layer at piezometers WD-PZ09C, WD-PZ11C, WD-PZ12C, WD-PZ15C, and WD-PZ17C. However, the hydraulic performance of the five mentioned piezometers varied in the extreme. WD-PZ09C and WD-PZ12C yielded 0.6 gpm and 1.2 gpm, respectively, while well yields at WD-PZ11C, WD-PZ15C, and WD-PZ17C were four orders of magnitude less. Based on similar lithology and piezometric head, similar hydraulic performance would be predicted. This conflicting and/or uncharacteristic observation, as well as others, indicates the possibility that skin effects may have dominated the hydraulic performance of the low-yielding piezometers. Skin effects are likely related to well construction and will be discussed in subsequent sections.

4.2 Piezometer Construction

At Proposed OSDC Area D, piezometers were installed using air rotary techniques to advance the borehole to a depth at least several feet deeper than the two-foot sandstone layer. The Cuyahoga Formation is both hydraulically low-yielding and friable. Described below are aspects of piezometer installation relating to the nature of the Cuyahoga Formation and ultimately to the suitability of the piezometers for aquifer performance testing:

- To enhance identification of minor saturated zones within the Cuyahoga Formation, no water was added to the airstream during advancement using air rotary.
- Because little water was produced by the formation and no water was added during drilling, little to no water was available to develop the borehole after reaching final depth. At a more productive borehole, a column of water is available to lift and drop, using air introduced to the bottom of the borehole through the tooling. The process causes vigorous flow in and out of productive zones, and is typically repeated over an extended period of time, until the purge water turbidity is reduced to acceptable levels.
- Because a column of water was not available for borehole development, it was not possible to clear shale cuttings (pulverized shale and clay to silt-sized particles) from the productive portion of the borehole (i.e., the bedding plane fractures at the lithologic contact between the two-foot sandstone and the surrounding shale).
- The friable Cuyahoga shale tends to crumble and collapse in the borehole, especially when exposed to water. Over the six to nine months between installation and aquifer testing, many piezometers became shallower, evidence of minor collapse.

4.3 Evidence of Poor Hydraulic Communication between Formation and Borehole at Tested Piezometers

Perhaps the strongest argument for poor communication between low-yielding Cuyahoga piezometers and the two-foot sandstone layer is the lack of barometric response recorded at the low-yielding Cuyahoga piezometers. The water levels measured in higher-yielding piezometers WD-PZ09C and WD-PZ12C respond with estimated 90% barometric efficiency. This means that 90% of the change in water level measured at the borehole is due to atmospheric pressure fluctuations acting on the exposed borehole and 10% of the change in water level measured at the borehole is due to water level changes in the aquifer acting on the exposed borehole. If all piezometers were in equal hydraulic communication with the two-foot sandstone layer, uniform barometric efficiency would be predicted across the proposed OSDC Area D (i.e, piezometers WD-PZ09C, WD-PZ11C, WD-PZ12C, WD-PZ15C, and WD-PZ17C would display similar barometric efficiency). Absent lithologic or piezometric head variation, a likely mechanism to profoundly change barometric efficiency is not available. More plausible is the notion of widely varying hydraulic communication between the Cuyahoga piezometers and the two-foot sandstone layer.

Another argument for poor communication between Cuyahoga piezometers and the two-foot sandstone layer is the linearity of the recovery data in the hydrographs for WD-PZ15C and WD-PZ17C. Linear recovery is uncharacteristic of a standard aquifer response. The atypical recovery, combined with an absence of barometric response, is a strong indicator of poor hydraulic communication between the piezometer and the saturated formation.

4.4 Impact of Poor Hydraulic Communication

As a result of the likely poor hydraulic communication between some Cuyahoga piezometers and the two-foot sandstone layer, it is premature to conclude with certainty that data collected from a low-yielding piezometer can be used to accurately estimate the hydraulic properties of the two-foot sandstone in the vicinity of the low-yielding piezometer. When analyzing data from a low-yielding Cuyahoga piezometer, it is unclear whether the piezometer is in good hydraulic communication with the two-foot sandstone. It is also possible that borehole instability and insufficient development play a large role in the absence or very small magnitude of hydraulic response.

To proceed conservatively with the data currently available, the following assumption is prudent: In areas where only low-yielding Cuyahoga piezometers are available, the true hydraulic conductivity in the two-foot sandstone layer lies somewhere between the values measured using type curve matching, at WD-PZ09C and WD-PZ12C, and the values estimated using Darcy's Law, at WD-PZ11C, WD-PZ12C, WD-PZ15C, and WD-PZ17C. This wide range of hydraulic conductivity provides limited assistance in the attempt to refine the site-wide numerical groundwater model in the vicinity of Proposed OSDC Area D.

4.5 Recommended Modifications

Each Cuyahoga piezometer would benefit from stabilization and development. To stabilize the piezometer, the installation of a conventional well using a five-foot screen, filter pack, and riser is recommended. Impairment of the two-foot sandstone layer that occurred during drilling (i.e., plugging productive fractures with fine material) must be repaired to restore the formation’s native hydraulic properties. Introduced water will be necessary, as a significant column of water will be required to cause forceful reversals of flow through the well screen and sandstone layer. Reversing the direction of flow breaks down cohesive fines and moves the fine material into the piezometer so that it can be removed. To force water into and out of the screen and sandstone layer, use of a surge block, air lifting, or alternative method will be necessary. To select the most appropriate development method, consultation with the drilling firm that installed the piezometers is recommended. After development, testing should be performed, following the methods used previously.

One zone was monitored during this test

The packer was set in a portion of the borehole located above the static water level. In the zone above the packer, 15.3 gallons accumulated over a period of 960 minutes. It is believed that a saturated zone, located at approximately 739 feet, contributed all of the water. Average rate of flow into the borehole was 0.016 gpm.

680 SANDSTONE LAYER AQUIFER TEST ANALYSIS SUMMARY

680 Sandstone Layer Aquifer Test Analysis Summary

Additional evaluation of Cuyahoga Formation aquifer performance tests (conducted by Dr. Changsheng Lu of Jacobs Engineering)

680 Sandstone Layer Aquifer Test Analysis Summary

1. The K values are in the 12-18 ft/day range. The Ks were calculated based on a 5-ft effective K zone. The testing intervals for the two tests are 8 and 15 ft, respectively.

2. Higher K range for the sandstone layer interval suggests the impact from the horizontal bedding planes existing within the test intervals (shale, sandstone). It is supported by the same K values derived used the horizontal fractured solution.

3. Leaky solution provide slightly lower K values.

4. The derived Ks are higher than the literature values of fractured sandstone (generally less than 1 ft/day). But most of the tests are based on thicker sandstone aquifer whereas this test is focused on shorter vertical interval where bedding plane is particularly abundant due to the lithology changes.

5. The lack of responses in other monitoring wells at other directions suggests the bedding planes may be controlled by localized depositional environments, such as change in layer elevation in a river delta depositional environments.

This appendix presents a summary of the final candidate study areas for a potential on-Site disposal cell (OSDC) at the Portsmouth Gaseous Diffusion Plant (PORTS). The U.S. Department of Energy (DOE) is evaluating waste management options for waste generated as a result of the potential decontamination and decommissioning (D&D) of facilities at PORTS. The feasibility study (FS) evaluates three alternatives for the waste: (1) no action; (2) on-Site disposal; and (3) off-Site shipment and disposal. One possible option for the on-Site disposal alternative is to design, construct, and operate a potential OSDC to accept the waste.

The evaluation of the study areas for development of a waste disposal facility, if the on-Site disposal alternative is selected, is presented in Section D.6 of this appendix. Study areas that do not merit further evaluation are first identified in a screening step after all viable areas are described. Then, those areas that are good candidates for a potential OSDC are further evaluated, and one location is selected to be a representative location for this FS. A single location is used to represent a potential OSDC in Section 8 of the remedial investigation (RI)/FS report, but other viable candidate locations could be reconsidered in the future.

The study areas were characterized to provide data to support evaluation of potential OSDC locations and to develop numerical waste acceptance criteria (WAC) for a potential OSDC (for the on-Site alternative). Important site-specific characteristics required by *Ohio Administrative Code (OAC)* 3745-27-06(C)(3) include the following:

Soil and bedrock characteristics
- Soil or rock type
- Color
- Moisture content
- Layering or interbedding
- Weathering
- Fracturing or jointing
- Mineral content
- Thickness
- Horizontal extent
- Depth and elevation.

Groundwater characteristics
- Uppermost aquifer system and significant zone of saturation
- Flow direction and rate
- Hydraulic conductivity
- Interconnection within upper aquifer system and significant zone of saturation
- Groundwater level elevation
- Temporal fluctuations
- Recharge and discharge
- Groundwater yield
- Groundwater chemistry.

Several intrusive field methods were used to obtain the required data to support the objectives, including, but not limited to, test pit excavation, cone penetration testing, hollow-stem auger drilling, and other drilling methods suitable for drilling in both unconsolidated and bedrock formations. Soil boring samples consisting of Shelby tube and split-spoon samples were collected from discrete depth intervals.

Piezometers and monitoring wells have been installed in three of the four study areas to determine depth to water and provide data on groundwater geochemistry. During the drilling program, soil/rock samples were collected for contaminant analyses (for example metals, radionuclides, volatile organics, semivolatile organics, and polychlorinated biphenyls), geochemical analyses (for example pH, cation exchange capacity, and total organic carbon), and geotechnical analyses (for example Atterberg limits, water content, consolidation, permeability, and unconfined compression). Soil/rock samples from the Minford and Gallia, as well as rock cores from the Cuyahoga Formation and Sunbury shale, were tested to determine site-specific distribution coefficients for uranium isotopes and technetium-99.

D.1 BACKGROUND

D.1.1 SUMMARY OF RESULTS OF PREVIOUS ECOLOGICAL AND CULTURAL RESOURCES STUDIES AT PORTS

Past consultations with the U.S. Fish and Wildlife Service indicate that some of the riparian areas on the PORTS Facility may be suitable summer habitat for the Indiana bat (*Myotis sodalis*), a federal- and state-listed endangered species. As a result of these consultations, DOE conducted surveys for the presence of the Indiana bat in 1994 and 1996. As part of the 1996 survey, potential summer habitat for the Indiana bat was identified in the Northwest Tributary stream corridor, particularly in an area of deciduous sugar maple forest within this corridor. Mist netting in this area was conducted in June and August 1996. Although 14 bats representing four common species were captured during the August survey, no Indiana bats were collected. Despite the position of the U.S. Fish and Wildlife Services, the survey concluded that most of the PORTS Facility has poor summer habitat for Indiana bats. The few woodlands that occur on the property are small, isolated, and not of sufficient maturity to provide good habitat for this species (Lockheed Martin Energy Systems, Inc. [LMES] 1997). Another bat mist-net survey was conducted in May 2011. During this survey, four nights of sampling resulted in the capture of eight bats, but no Indiana bats were observed (EnviroScience 2011). Additional mist netting occurred in July 2013 in Study Area D. Several bats were caught, including Northern Long-eared bats, but no Indiana bats were observed. Ohio University has completed a detailed habitat mapping study; the final report will be available early 2013. Preliminary findings from this study, using updated guidelines, are that the Indiana bat habitat may be more extensive than indicated in prior studies and in fact, the potential habitat extends over portions of both Study Area C and Study Area D (Ohio University 2012). The primary trees that produce exfoliating bark and nesting cavities (e.g., sycamore and shagbark hickory) are abundant in the older forest habitats. Additional consultation with the U.S. Fish and Wildlife Service in 2012 indicated that they had no record of Indiana bats being sighted or caught in Pike County, Ohio. They also confirmed that the species is still federally listed, and its home range does include the PORTS area.

The Carolina yellow-eyed grass, a state endangered plant species that prefers wet peaty or sandy soils typically found in marshes or bogs (U.S. Nuclear Regulatory Commission [NRC] 2006), was observed on the PORTS Facility in 1994 adjacent to the south side of the X-611B sludge lagoon. However, formal documentation of the species could not be performed because the grass was not in fruit or flower. Additional studies being completed by Ohio University may provide locations that harbor listed, high-interest plant species. No federally listed plant species have been observed during the current study but some state-listed species were tentatively identified.

The Ohio Environmental Protection Agency (Ohio EPA) previously determined that two state endangered fish species and four state threatened fish species exist near PORTS, but they are restricted to the Scioto River. Little Beaver Creek, the main body of water running through PORTS, does not provide sufficient habitat to support threatened or endangered species of fish (NRC 2006). However, the Ohio Department of Natural Resources (ODNR) lists Little Beaver Creek as an exceptional warmwater stream.

PORTS and its surrounding area have the potential to yield both prehistoric and historic cultural resources. The studies conducted to identify archeological resources began with a Phase I literature review and archaeological reconnaissance survey conducted in 1996 and 1997 at PORTS (Schweikart et al. 1997) and concluded with recent Phase II surveys being conducted in 2012 at Study Area D (Mustain 2013). The results of all these surveys are four sites eligible for inclusion as historic properties on the National Register of Historic Places (NRHP).

No prehistoric Native American mounds had been documented on the PORTS Facility. During May and June 2011, a study was conducted of the entire PORTS Facility to determine if there were prehistoric mound-like features on the plant (Burks 2011). This study included a detailed review of the PORTS preconstruction topographic maps and the use of high-density Light Detection and Ranging (LiDAR) data. As a result, 28 topographic features (1 ft – 10 ft tall and up to 82 ft in diameter) were identified on the PORTS Facility. However, archaeological ground-truthing visits to each location indicated that all of these features were either naturally occurring features or a result of historic-era or recent activity on the PORTS Facility (Burks 2011).

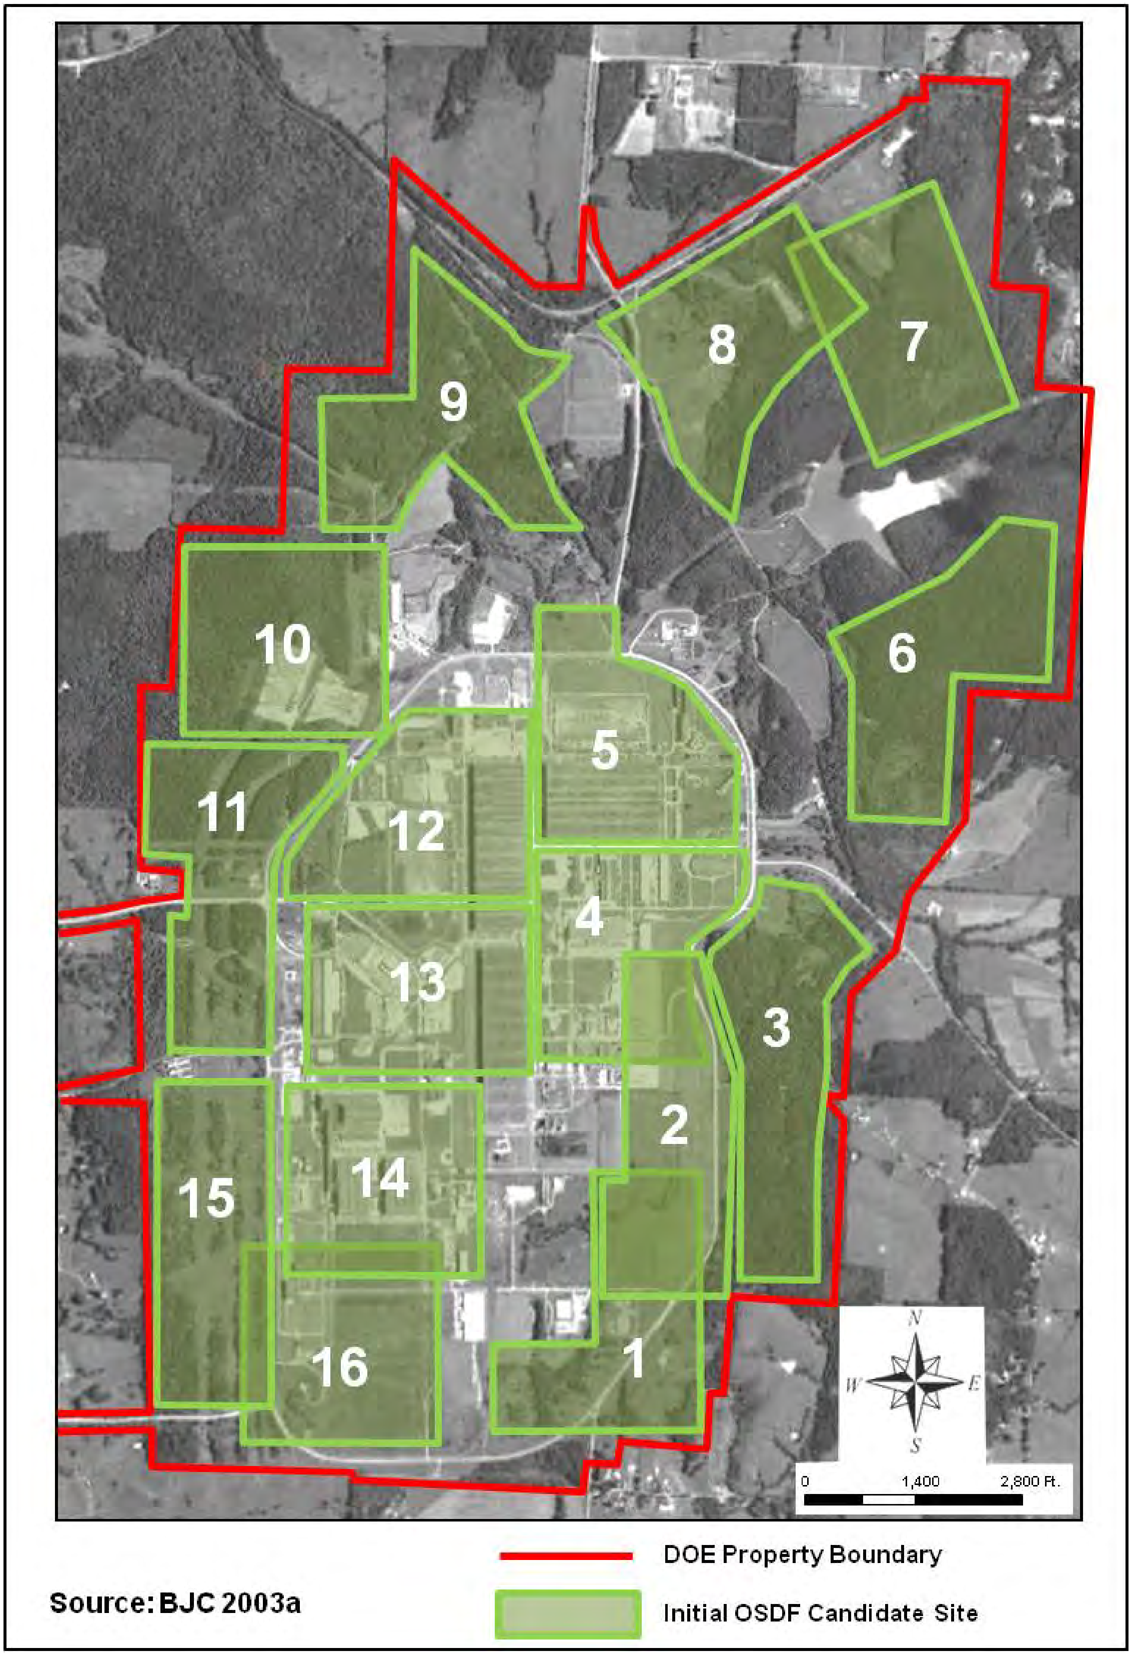
The study concluded that PORTS contains no prehistoric mounds 1 ft tall or taller, which is the vertical size range of nearly all such documented mounds in Ohio. If smaller or more deflated mounds are present on PORTS, they are not detectable using LiDAR data or visual examination for topographic features.

In 1996 and 1997, an architectural survey of the PORTS plant was conducted. During this survey, 196 architectural properties were identified at 160 architectural locations throughout constructed areas of the PORTS Facility. These properties consisted of various buildings, facilities, and structures. Based on the results of this survey, DOE prepared a National Historic Preservation Act (Section 110) survey report on the identified architectural resources and submitted this report to the Ohio Historic Preservation Office (OHPO) for review and approval (DOE 2011). The OHPO accepted the final report in March 2011.

D.1.2 HISTORICAL OSDC SITING STUDY RESULTS

DOE completed a preliminary assessment of the volumes, types, and forms of waste that would be generated from plant cleanup activities, which they continue to refine. An identification and screening report (Bechtel Jacobs Company LLC [BJC] 2003a) was prepared to identify candidate locations for a potential OSDC. This report considered a potential OSDC that would consist of an above-grade, Resource Conservation and Recovery Act of 1976 (as amended) (RCRA)-compliant earthen disposal cell with a capacity for 4 million cy of waste (based on preliminary estimates in the waste volume/characteristics inventory [BJC 2003b]) and a footprint of 150 acres for landfill, buffer, and support facilities. The current conceptual design is considering a potential OSDC with a capacity of up to 5 million cy, which could contain most D&D waste plus potential waste from environmental remediation.

Sixteen candidate locations were initially identified throughout the DOE property (Figure D.1). These locations met the preliminary siting requirements and could reasonably be considered acceptable areas for placement of a potential OSDC (BJC 2003a). To be considered an initial candidate location, the area had to be located entirely within DOE-owned property, contain at least 150 contiguous acres, and not be technically or administratively impracticable or cost prohibitive. The 16 potential locations were identified and screened against individual criteria categorized as threshold, modifying, or final criteria.



Source: BJC 2003a

Figure D.1. Initial Candidate Locations for a Potential On-Site Waste Disposal Cell at PORTS

D.1.3 STUDY AREAS CONSIDERED IN THE RI/FS

The results of the historical screening were reviewed to determine the most suitable study areas for further evaluation in an RI/FS. Beginning in early 2011, the RI/FS project team began discussions with Ohio EPA regarding the most favorable location for a potential OSDC. The original site 2 and modified site 5 were retained for further evaluation. Sites 3 and 8 were also added for consideration because of favorable underlying geology and distance to groundwater. Site 3 was originally screened out because of its location along a ridge and topographic relief of 135 ft, which requires extensive earthwork to prepare the location for a potential OSDC. However, being located along a ridge underlain by shale provides a favorable hydrogeologic condition when combined with a potential depth to groundwater beneath the cell liner of 50 ft or greater. At the time, only one monitoring well was near this location, and the measured depth to groundwater was approximately 80 ft below the ground surface. These candidate locations, sites 2, 5, 3, and 8 (Figure D.2), were subsequently renamed for this RI/FS as Study Areas A, B, C, and D, respectively, as a means to differentiate them from the previous studies.

The following sections provide additional details for consideration with regard to these four study areas. Each study area is larger than any potential footprint of a potential OSDC. Each study area description provides a summary of the geology and hydrogeology required by *OAC* 3745-27-06(C)(3). Most of the geologic and hydrogeologic information for these areas is derived from the RCRA Facility Investigation reports completed for each quadrant (DOE 1996a, 1996b, 1996c, 1996d).

D.2 DESCRIPTION OF STUDY AREA A

Study Area A is located in the southeastern portion of the PORTS reservation. It has low to moderate topographic relief (110 ft) with topography ranging from 660 to 770 ft above mean sea level (AMSL) (Figure D.3). Study Area A has only been marginally impacted by plant operations. The only major surface structures within the area include an abandoned airstrip, parking areas, and a portion of Perimeter Road (approximately 3,800 ft) that lies along the eastern and southeastern edges of the study area. Study Area A does not contain any buildings or structures located in a land-use conflict area or scheduled for D&D, reindustrialization and reuse, or future redevelopment infrastructure. Study Area A offers engineering options such as using the existing landscape as part of the design for a potential OSDC by building the cell into the hillside and blending it with the topography.

Study Area A is in close proximity to existing utilities, which is beneficial for construction and operation of a potential OSDC. However, this area contains approximately 4,800 ft of natural gas pipeline that would need to be relocated if it were selected for a potential OSDC. This area is relatively close to the East and South Access Roads, but a portion of Perimeter Road would need to be relocated if a potential OSDC were constructed here.

Land use within Study Area A is primarily managed grassland and forest. The only developed areas are Perimeter Road, which runs north-south through the approximate center of the area, the south half of the large X-206A Parking Lot, and part of its connector road, which intersects Perimeter Road. The managed grassland is around the parking lot and roads in the central and western portions of the study area. Upland forest occupies the entire eastern portion of Study Area A.

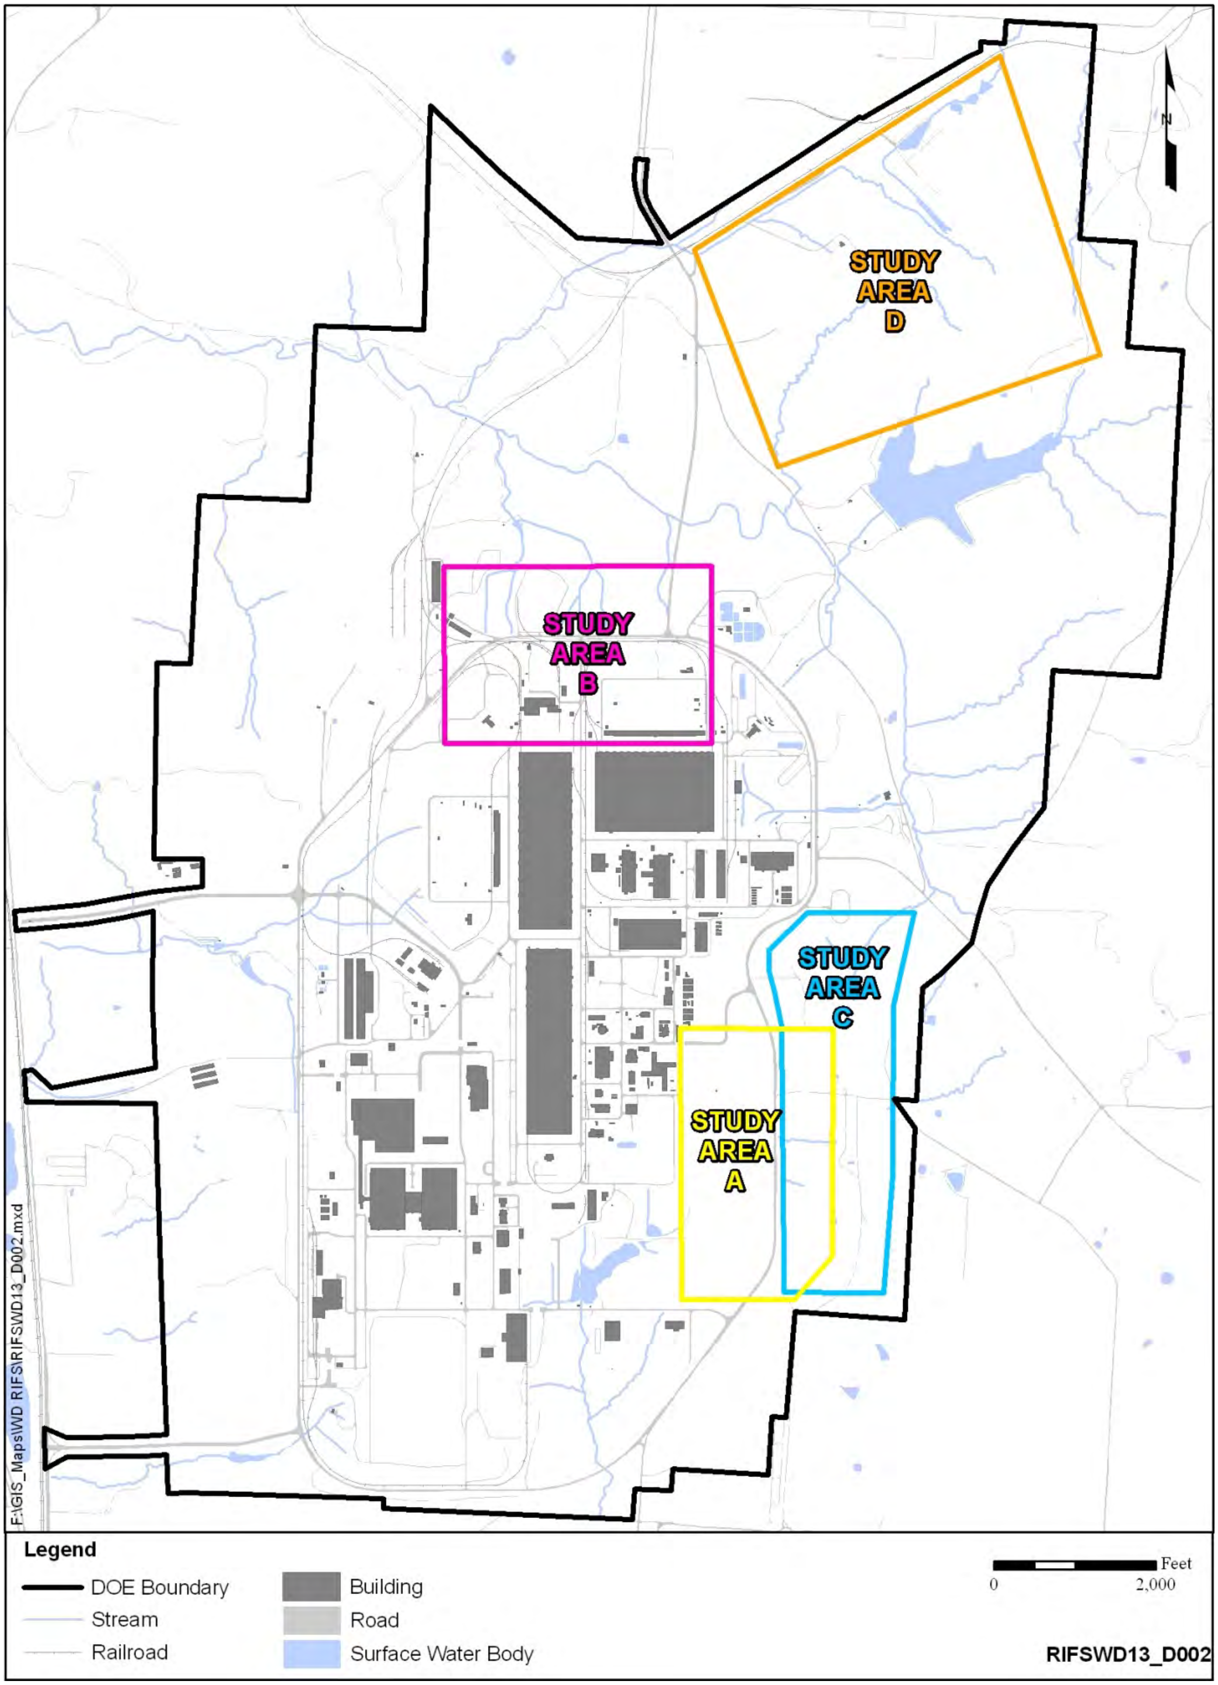


Figure D.2. Four Study Areas Being Evaluated for a Potential On-Site Waste Cell at PORTS

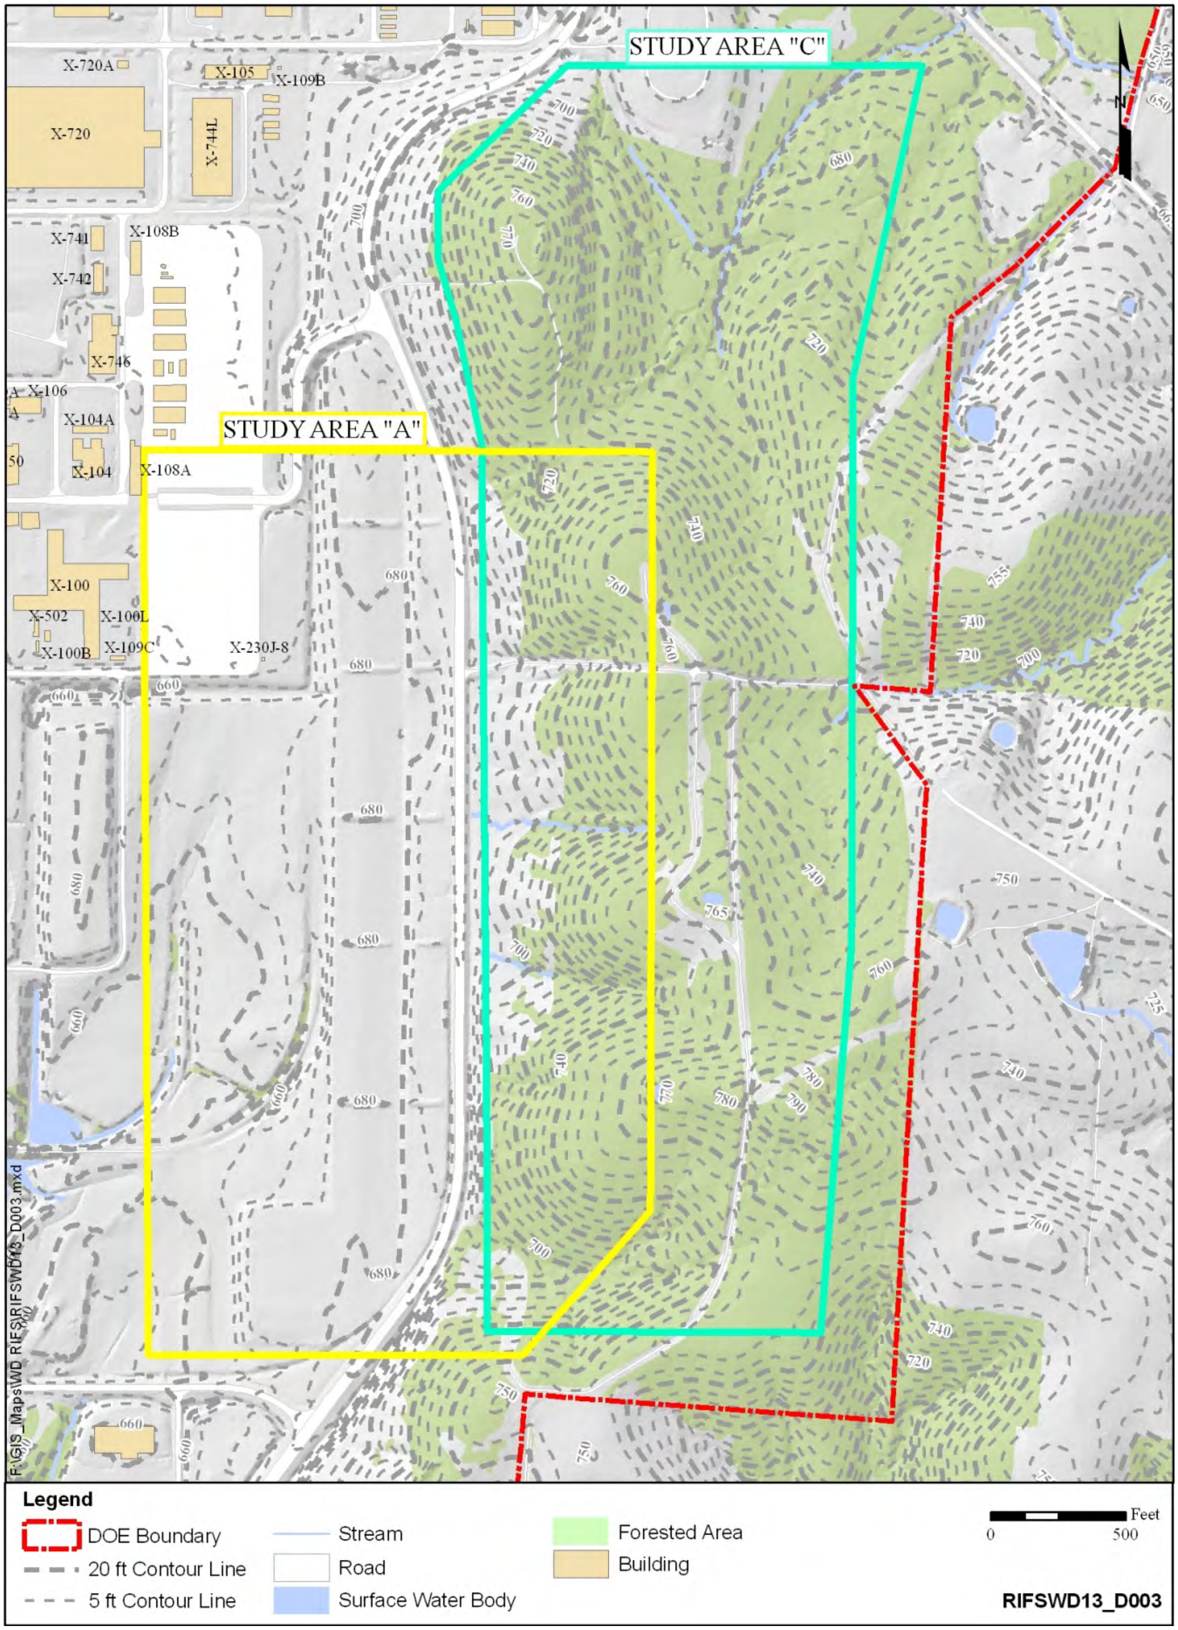

Figure D.3. Topography of Study Areas A and C at PORTS

D.2.1 GEOLOGY, HYDROGEOLOGY, AND SOILS

Study Area A lies on the eastern edge of the ancestral Portsmouth River valley. Stratigraphic units from youngest to oldest in age include the Quaternary Teays Formation (Minford Member/Gallia Member) unconformably overlying the Mississippian to Upper Devonian Cuyahoga Formation, Sunbury shale, Berea sandstone, and Bedford shale.

The Teays Formation is a 30- to 40-ft-thick unconsolidated unit consisting of fluvial Gallia sand and gravel overlain by Minford clay and silt. These units were deposited in an erosional valley cut by the ancestral Portsmouth River during the Pleistocene Epoch. The Gallia averages less than 5 ft in thickness and is characterized as reddish-brown, clayey, poorly-sorted, medium-to-coarse sand and gravel. The Minford consists of two units with a gradational contact. The upper unit is predominantly silty clay with some very fine-grained sand, and the lower silt unit is composed of clayey silt and very fine to fine-grained sand. Geotechnically, the Minford consists primarily of overconsolidated lean clays and silts (Law Engineering 1978). This overconsolidation possibly resulted from the weight of perhaps as much as 200 ft of similar material previously overlying the existing deposits. A summary of the Atterberg limits from samples collected within and near Study Area A (211 samples from 27 soil borings) is shown in Figure D.4. This plot is very similar to the one for samples collected from the Minford in the southwestern portion of PORTS near the centrifuge plant and indicates the geotechnical properties of the Minford are likely similar across the plant. The plastic limits of the clays are relatively constant with depth and average about 20 percent. As expected of highly overconsolidated soils, the Minford materials are quite strong (Law Engineering 1978).

Figure D.5 shows the locations of geologic cross sections for the study areas. Figure D.6 shows the configuration of the top of the bedrock surface within Study Area A and clearly indicates the edge of the ancestral valley against the higher ridge on the eastern edge of Study Area A. The depth to bedrock varies from less than 10 ft on the eastern portion of the study area to greater than 40 ft in the western half of the area. The Teays Formation directly overlies the Sunbury shale west of Perimeter Road and the Cuyahoga Formation east of Perimeter Road.

The topographic ridge in the eastern one-third of the study area is underlain by the Cuyahoga Formation. Thickness of the Cuyahoga Formation varies from 0 ft where it has been removed by erosion to approximately 140 ft on the extreme eastern edge of Study Area A. The Cuyahoga Formation (a moderately hard, thinly laminated shale with sandstone laminations) is then underlain by the Sunbury shale, which is approximately 20 to 25 ft thick. The Berea sandstone, with an average thickness of approximately 35 ft in the PORTS area, lies beneath the Sunbury shale. The Berea is composed of a light gray, hard, thickly bedded, fine-grained sandstone with thin shale laminations. The bedrock formations dip gently to the east-southeast at approximately 30 ft/mile. Stratigraphic relationships are shown in Figure D.7.

The groundwater flow system at Study Area A includes the aquifers consisting of the unconsolidated Gallia sand and gravel and the Berea sandstone, along with the aquitards of Cuyahoga/Sunbury shale, Bedford shale, and unconsolidated Minford clay and silt. The basal portion of the Minford is generally grouped with the Gallia to form the uppermost aquifer and primary water-bearing unit at PORTS.

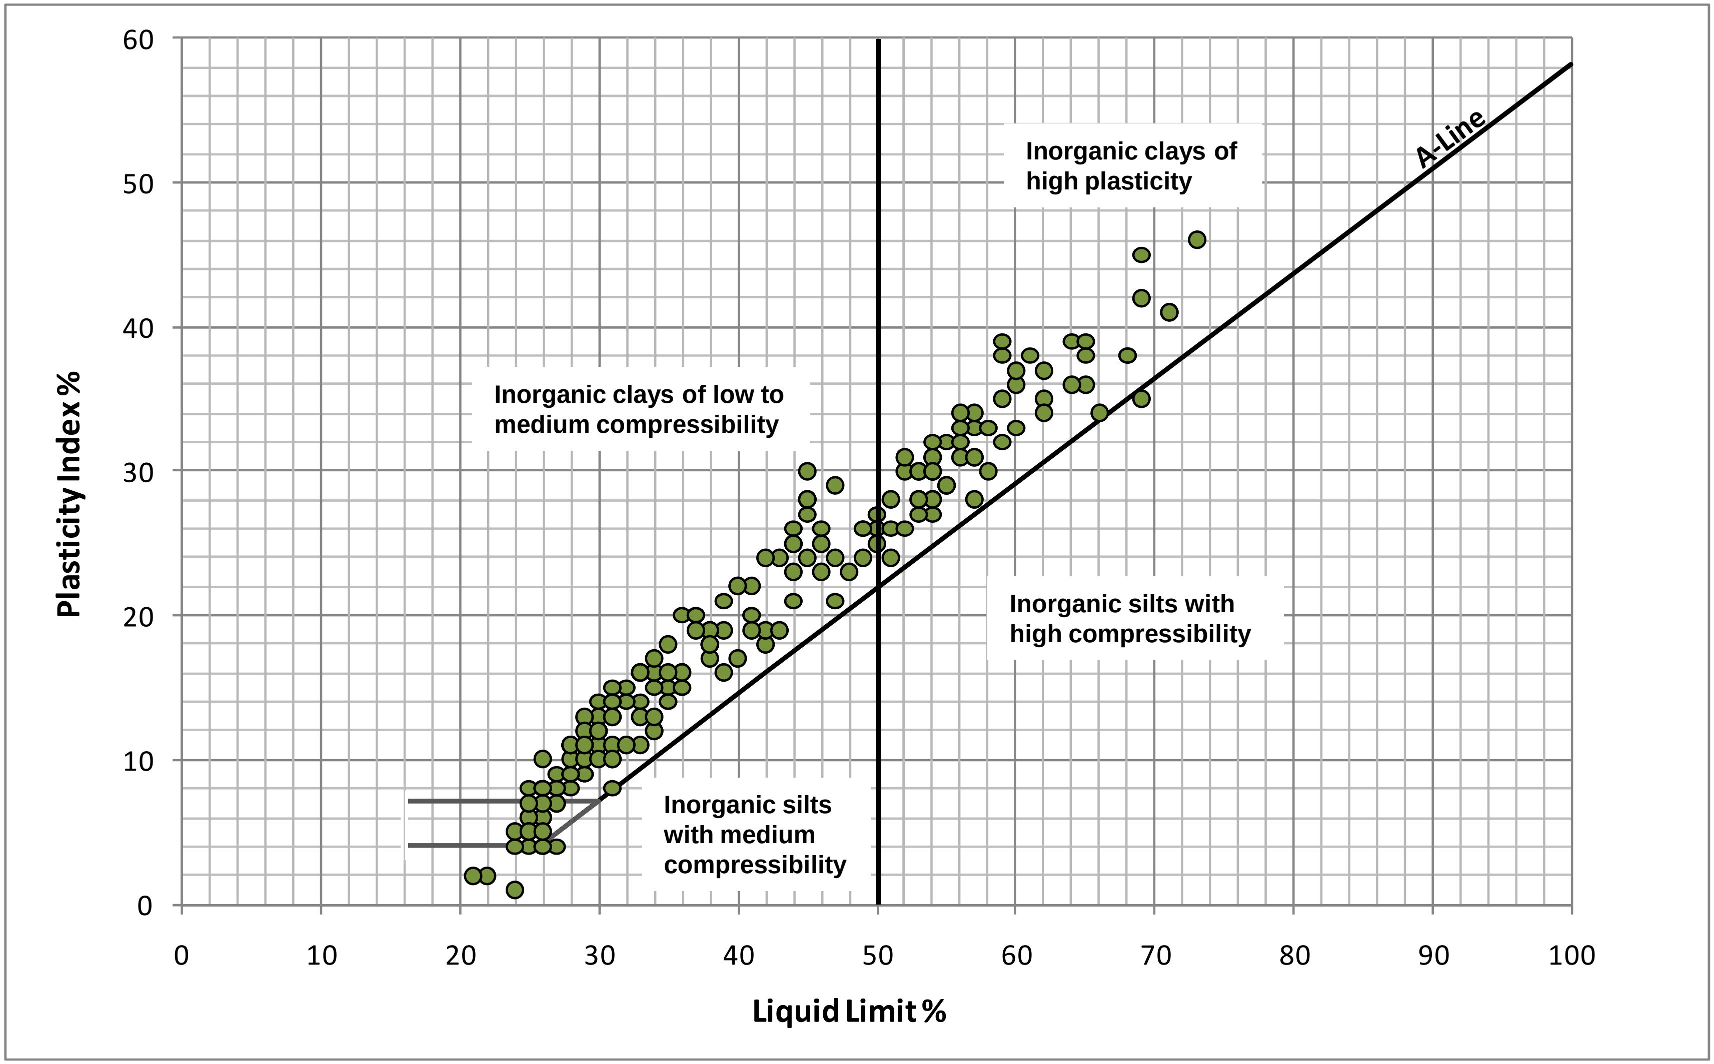

Figure D.4. Atterberg Limits of the Minford Member in Study Area A at PORTS

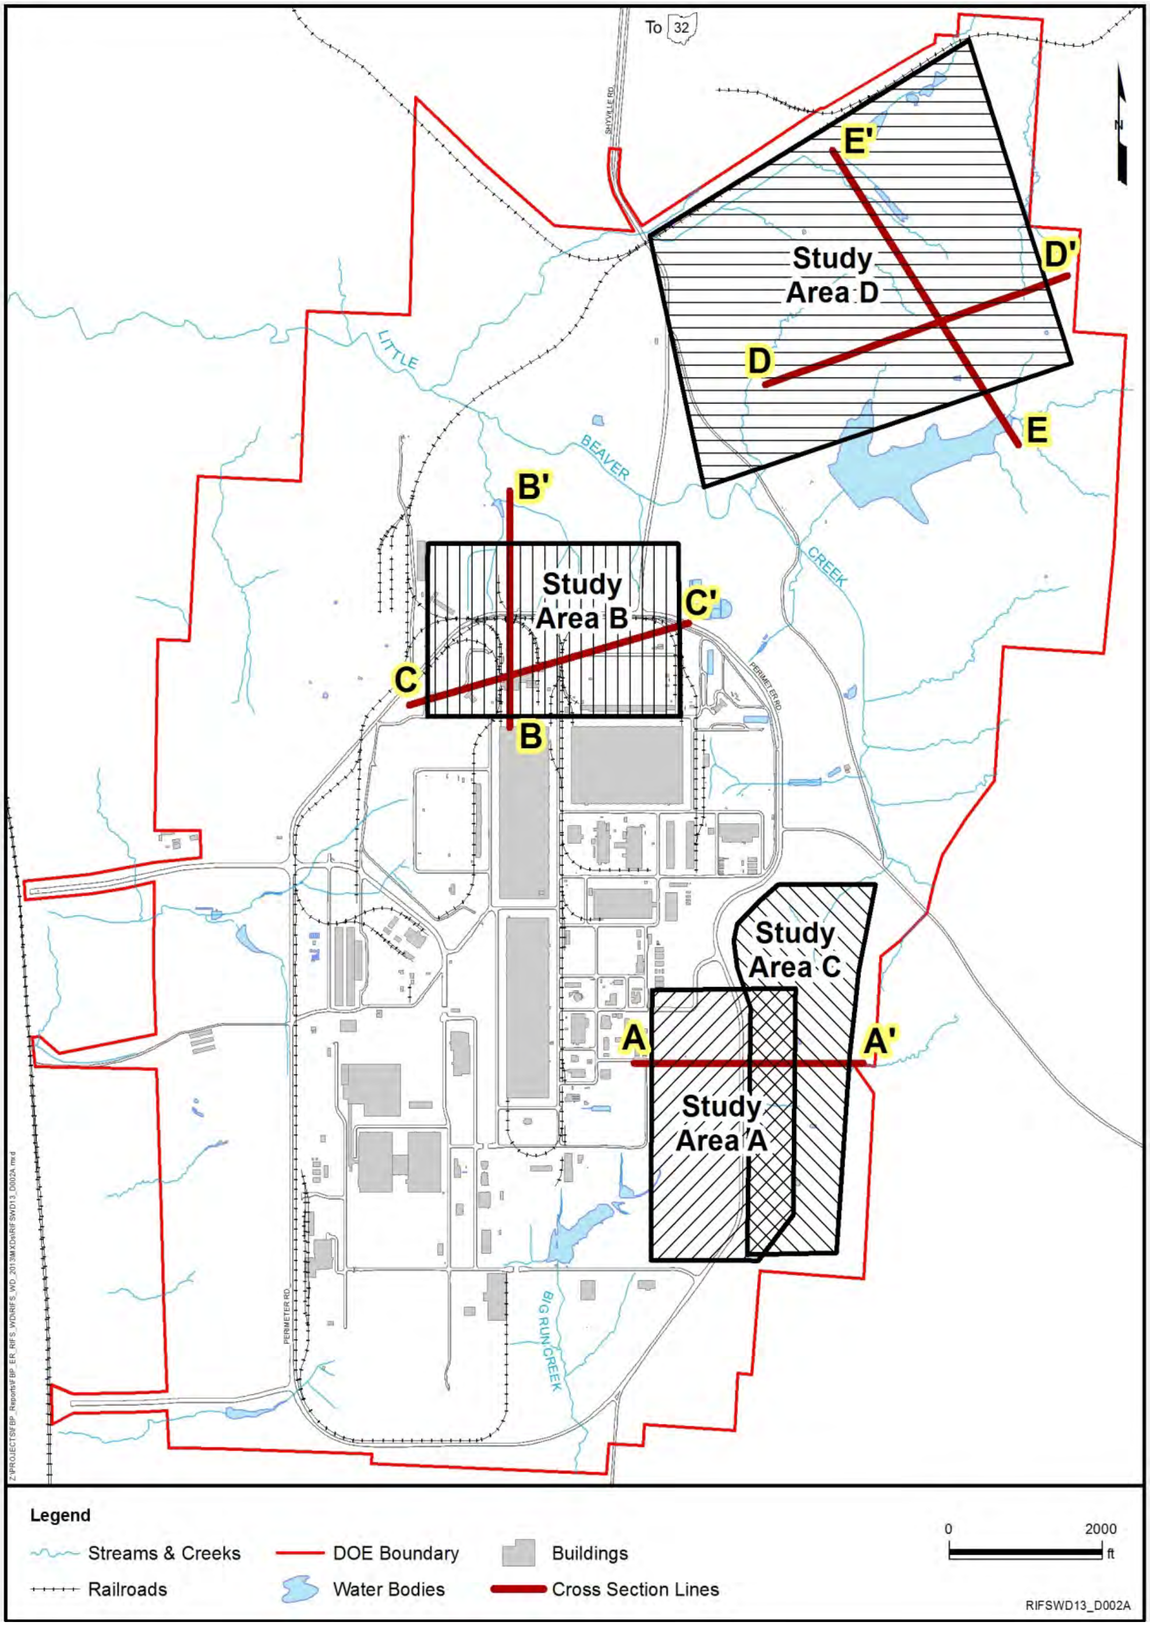

Figure D.5. Geologic Cross-section Locations

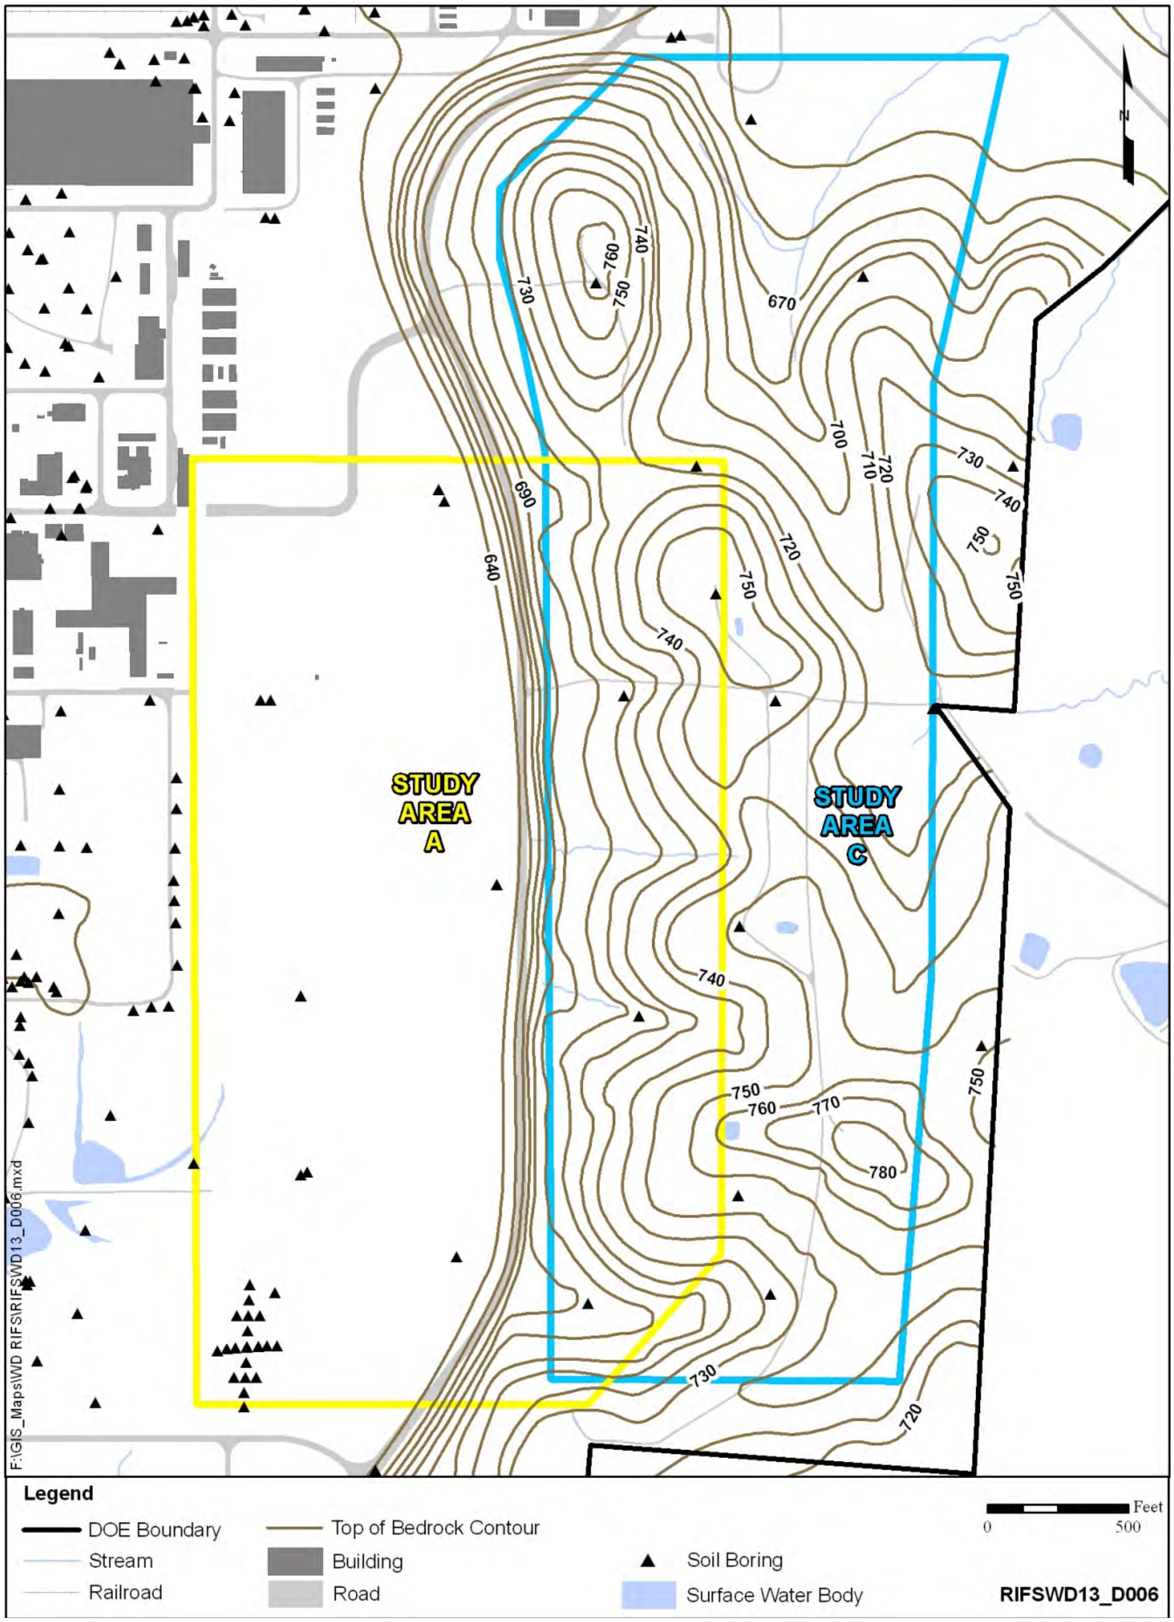

Figure D.6. Top of Bedrock in Study Areas A and C at PORTS

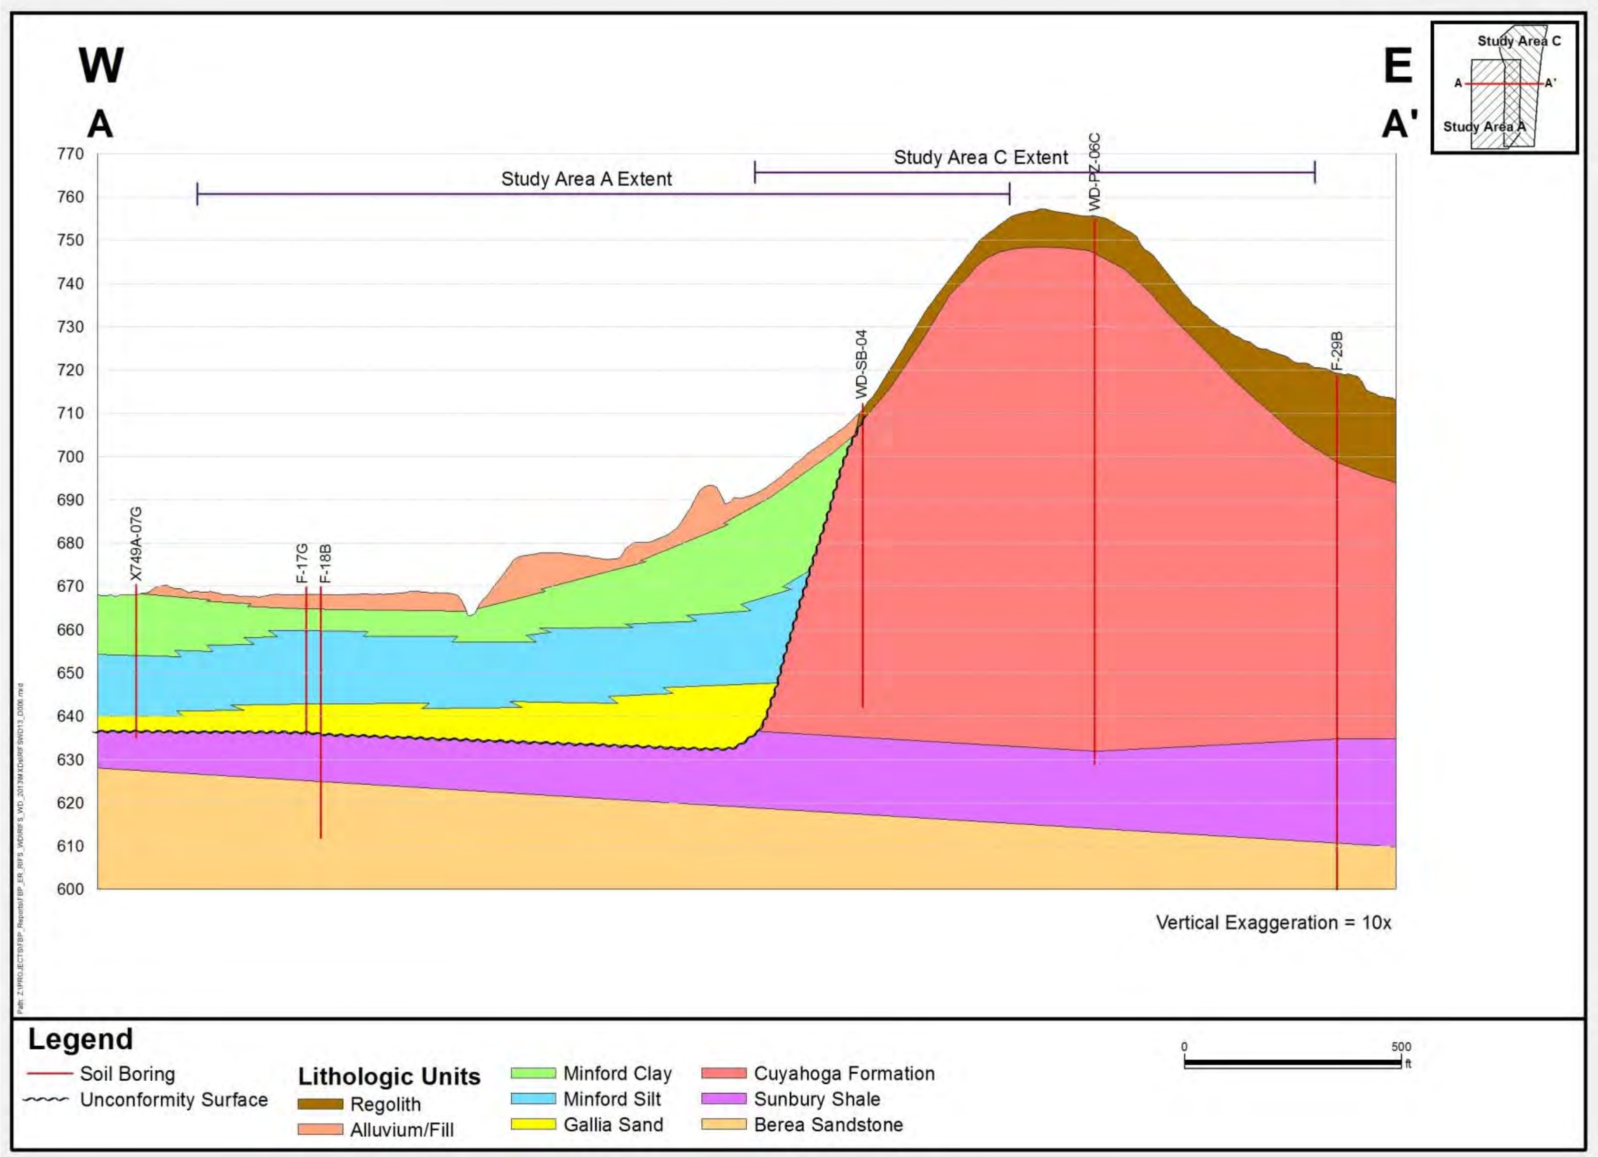

Figure D.7. Geologic Cross Section for Study Areas A and C at PORTS

Groundwater recharge and discharge areas at PORTS include both natural and man-made recharge and discharge areas. Natural recharge to the groundwater flow system comes mainly from precipitation, although land use and the presence of thick upper Minford clay deposits and the Sunbury shale effectively reduce recharge to underlying units. Discharge of groundwater to the surface occurs primarily along streams that transect the plant. Natural recharge to the central portion of the plant is approximately 4 to 7 in./year whereas recharge in the uplands (areas underlain by shale bedrock) is 2 to 4 in./year (ODNR 2003). Along the eastern portion of Study Area A, the portion underlain by the Cuyahoga Formation, shallow groundwater may be found in the lower portion of the regolith above the more impermeable bedrock. Regolith includes soil, residuum, and colluvium overlying the Cuyahoga Formation in the upland areas at PORTS. A couple of shallow-dug wells were found just to the east of Study Area A, and the depth to water in one of those wells was approximately 14 ft. (The other well, with a total depth of almost 13 ft, was dry.)

Groundwater flow within the Gallia at PORTS is generally divided into four separate flow regions, or quadrants. Study Area A lies within the southern portion of PORTS. The direction of groundwater flow in this area is controlled by the presence of surface drainages (Big Run Creek and the Southwest Drainage Ditch), the storm sewer system, and bedrock topography. In general, groundwater in the Gallia at Study Area A flows from north to south (Figure D.8) toward the X-230K Holding Pond and eventually discharges into Big Run Creek. Figure D.8 is modified from the 2012 annual groundwater report for PORTS (DOE 2013), and it shows the third quarter 2012 potentiometric surface. The depth to the Gallia potentiometric surface ranges from approximately 25 to 30 ft at WD-PZ01G and WD-PZ02G to 5 ft at WD-PZ03G, which lies at a lower elevation. The water table within the Minford generally lies 10 to 15 ft below ground surface. The hydraulic gradient is low (ranging from approximately 0.002 ft/ft to 0.005 ft/ft) because of the flat valley floor and the presence of thicker, more permeable Gallia deposits. The vertical hydraulic gradient from the Gallia to the Berea is steep, ranging from approximately 0.4 ft/ft to 0.6 ft/ft with the potentiometric surface of the Berea approximately 10 to 20 ft below that of the Gallia at Study Area A. The vertical hydraulic gradient between the Gallia and Berea decreases to the west of Study Area A as the Sunbury shale thins.

Groundwater flow in the Berea is northwest to southeast with a gradient varying from approximately 0.004 to 0.007 ft/ft (Figure D.9). Figure D.9 represents the potentiometric surface for the third quarter of 2012 (DOE 2013). The gradient in the Berea is slightly greater than the horizontal gradient observed in the Gallia. While groundwater yield in the Berea is typically lower than the yield in the Gallia, the Berea is a widespread unit and is considered to be a regional aquifer. The potentiometric surface of the Gallia fluctuates 5 ft or less on a seasonal basis with groundwater flow direction remaining essentially the same (DOE 2013). Seasonal fluctuation in the groundwater levels for the Berea are similar to the Gallia where the two aquifers are interconnected, but the Berea potentiometric surface fluctuates less on a seasonal basis where it is confined by the Sunbury Shale.

The hydraulic properties of the hydrogeologic units have been defined during previous investigations at the facility. The average hydraulic conductivity for the Minford clay is 2.3×10^{-4} ft/day, and the average hydraulic conductivity for the Minford silt is 4.3×10^{-3} ft/day. These values are based on numerous laboratory tests (DOE 1996a). The vertical hydraulic conductivities of Minford clay and Minford silt are approximately an order of magnitude lower than their horizontal hydraulic conductivities. Minford hydraulic conductivity determined during the geotechnical investigation of the centrifuge site ranged from 3.12×10^{-2} ft/day for the silty facies to 2.5×10^{-5} ft/day for the clay facies (Law Engineering 1978).

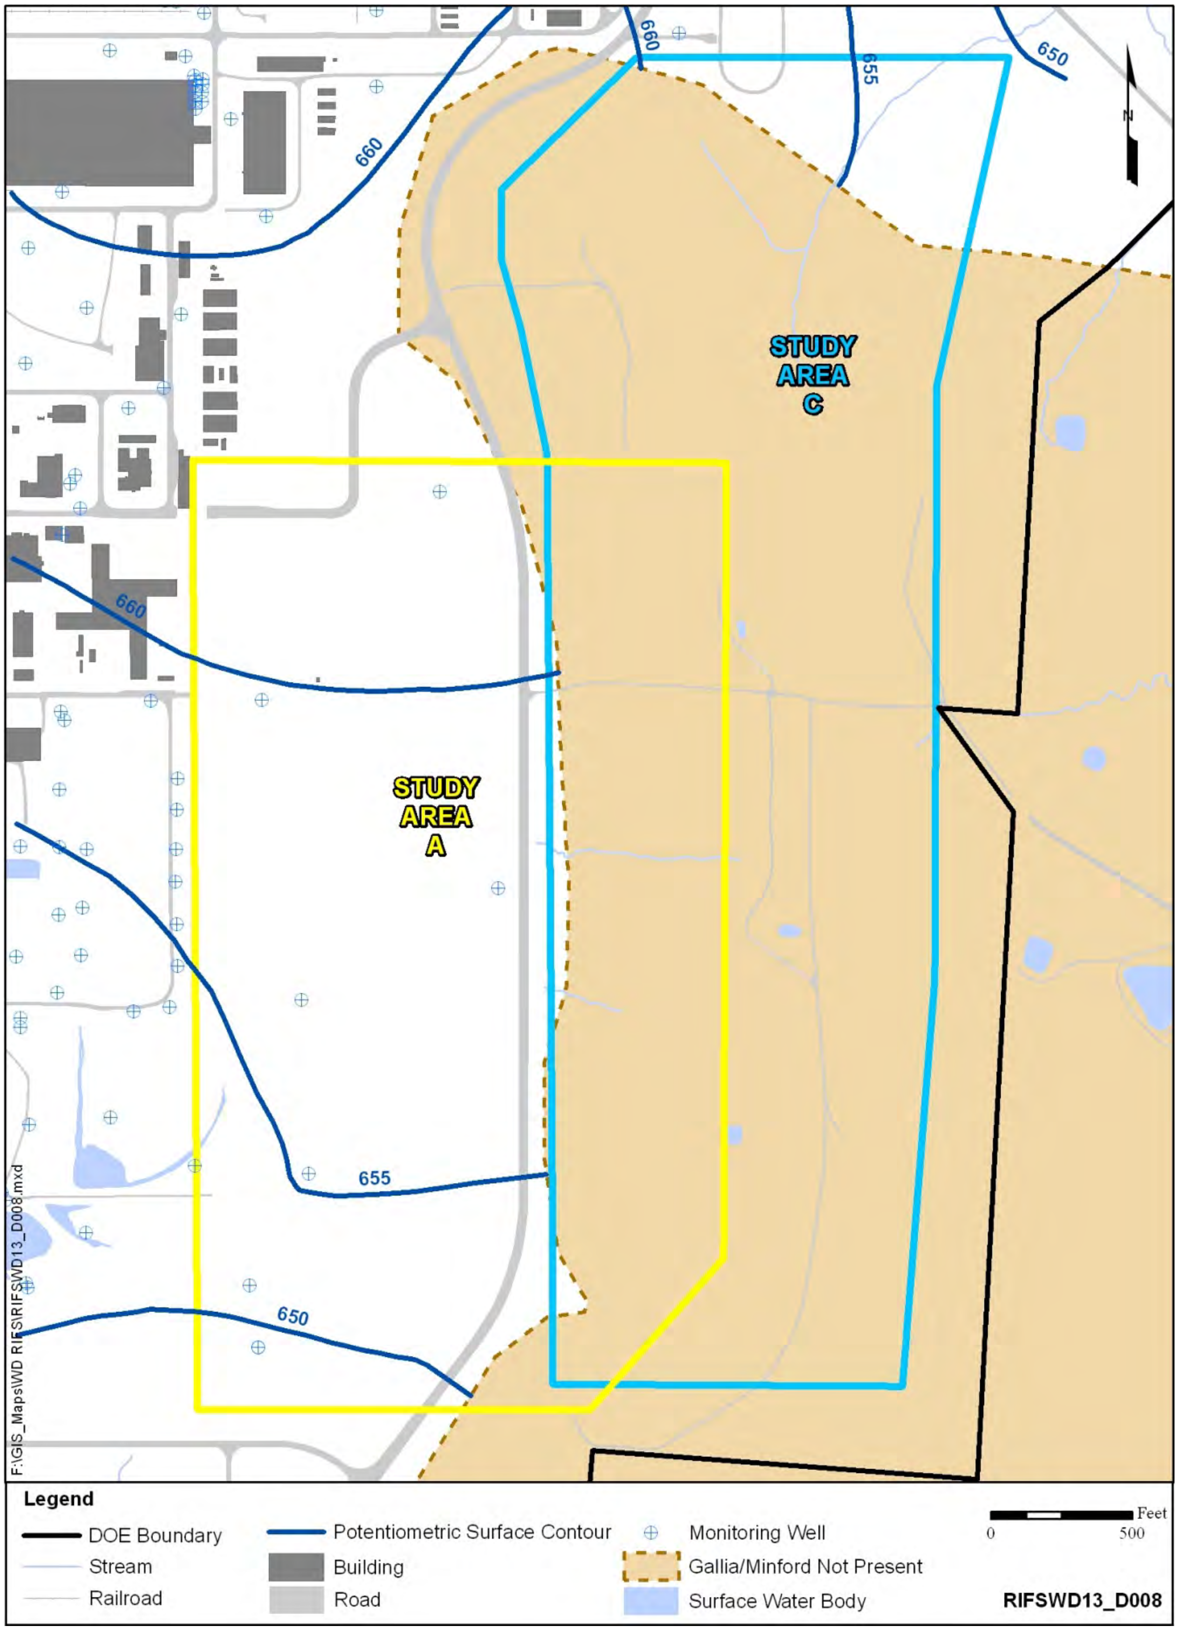

Figure D.8. Potentiometric Map of the Gallia in Study Areas A and C at PORTS

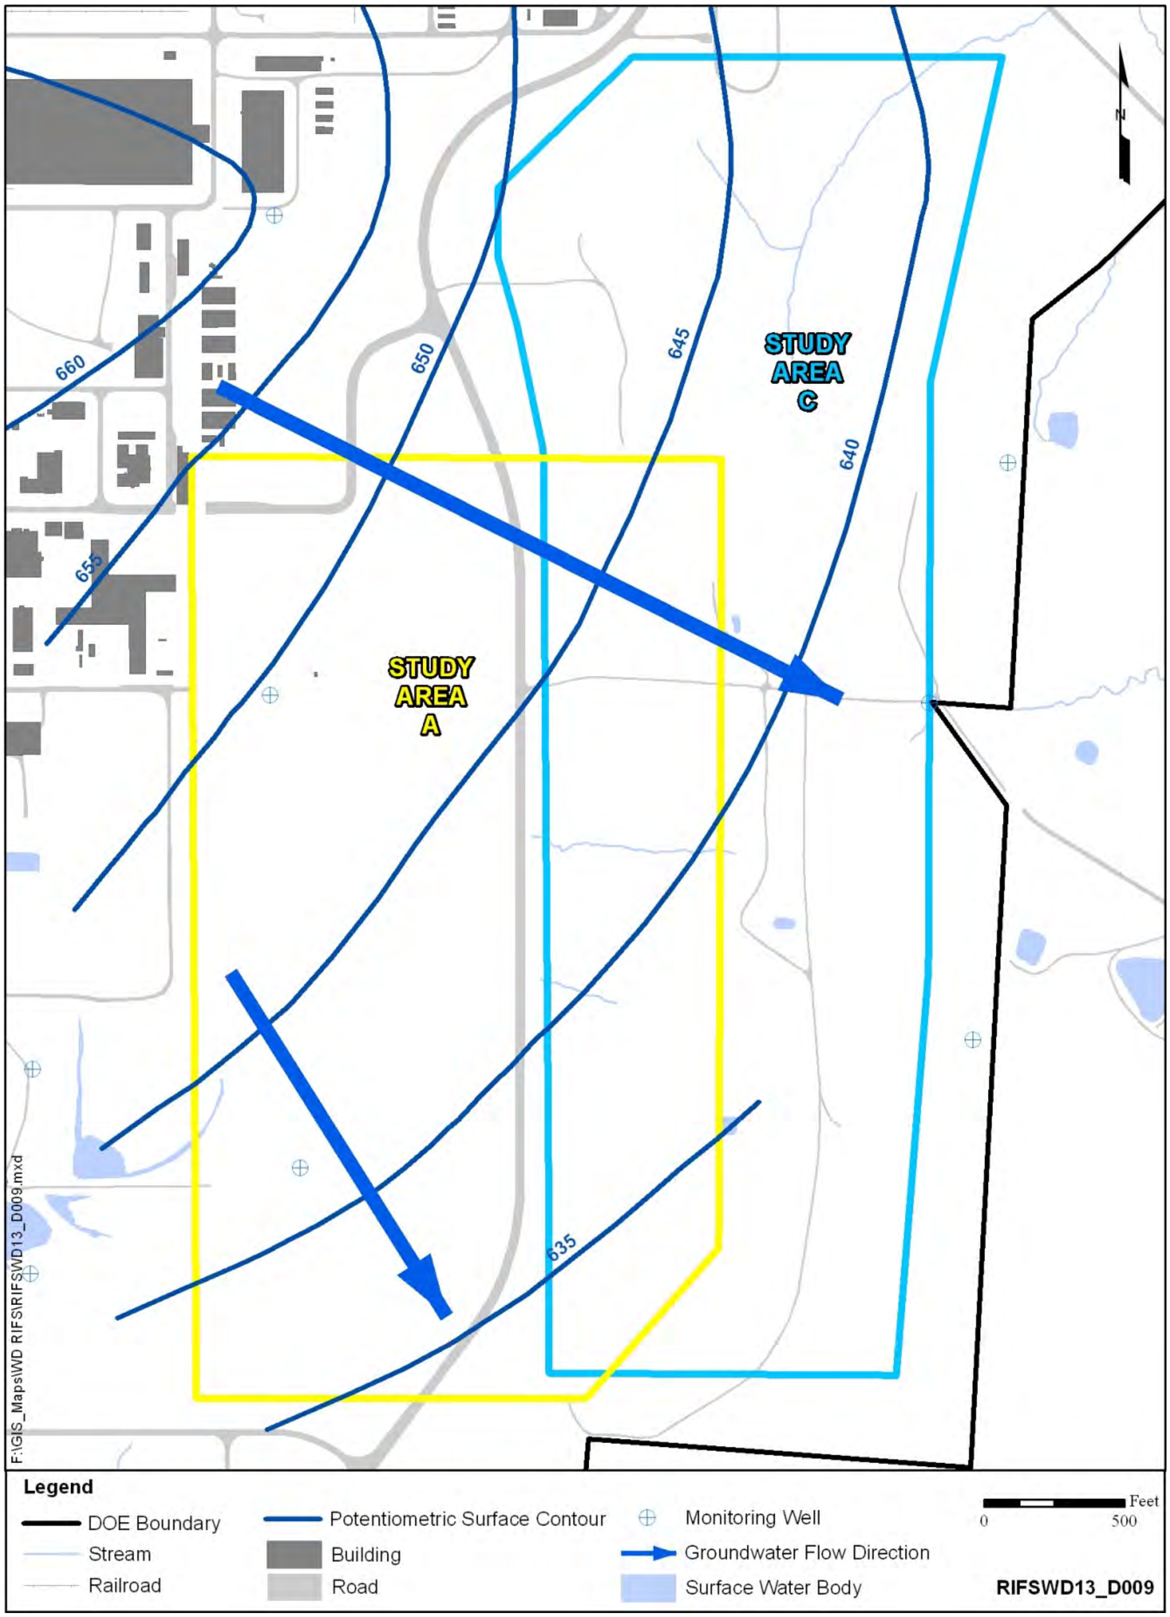

Figure D.9. Potentiometric Map of the Berea Sandstone in Study Areas A and C at PORTS

The hydraulic conductivity determined by single-well aquifer tests of the Gallia ranges from 0.11 to 150 ft/day with a mean value of 3.4 ft/day (DOE 1996a). Hydraulic conductivity tests on Gallia material from the gaseous centrifuge site averaged approximately 0.42 ft/day (Law Engineering 1978). While typically referred to as a sand and gravel unit, the Gallia has been reported to have an average clay content of 30 percent (Law Engineering 1978).

The estimated hydraulic conductivity of the Sunbury shale is based on numerical groundwater modeling with ranges from 1.6×10^{-4} to 9.6×10^{-4} ft/day (DOE 2009). The vertical hydraulic conductivity of the Sunbury shale is assumed to be an order of magnitude lower than its horizontal hydraulic conductivity. (Samples collected from Study Areas C and D provided an average vertical hydraulic conductivity of 1.2×10^{-5} ft/day.) Permeability testing on samples from the deeper Bedford shale yielded an average value of approximately 8.2×10^{-2} ft/day (Law Engineering 1978). The hydraulic conductivity determined by single-well aquifer tests of the Berea sandstone ranges from 4.5×10^{-3} to 15.0 ft/day with a mean value of 0.16 ft/day. The higher hydraulic conductivity tends to occur in areas where the Sunbury shale is absent.

In areas where stress-relief fractures occur in the Cuyahoga Formation, some of the groundwater moves downward from the regolith to provide recharge to the deeper bedrock system. (In test pits, the more brittle sandstone layers were observed to have vertical fractures that did not extend into the overlying or underlying shale.) In a previous test trench located approximately 1,400 ft south of Study Area A, a few joints were visible in the weathered shale. The joints had preferred strikes of about north 50° west, and joint spacing varied from approximately 5 ft to greater than 25 ft. A continuous 1-ft-thick sandstone at approximately 672 ft AMSL was described as highly fractured. Groundwater that migrates into the fractures eventually migrates laterally along the joints or sandstone layers and likely emerges as ephemeral seeps along the hillside downgradient from the recharge areas.

Figure D.10 is taken from a pollution potential map of Pike County (ODNR 2003). The pollution potential map ranks areas with respect to relative vulnerability to contamination of underlying groundwater based on geologic parameters (such as the higher the number, the greater potential for groundwater impacts). This figure indicates that the portion of Study Area A underlain by the Minford and Gallia has a higher relative pollution potential (relative pollution potential of 122) than the eastern portion of the study area, which is underlain by shale (relative pollution potential ranging from 95 to 103). This would be expected because the Gallia does not exist in the eastern portion of Study Area A, and the permeability of the shale bedrock reduces the overall recharge in that area. The permeability of the shale would also provide a longer travel time if a contaminant were present.

The most relevant potential contaminant migration pathway from an engineered disposal facility is by water infiltration from the waste, through the unsaturated zone, and to the groundwater system beneath the facility. Many physical, chemical, and biological processes influence the contaminant fate and transport in these zones. The major processes include advection, hydrodynamic dispersion, retardation, biodegradation, and reactive transformation. For unsaturated and saturated zones at PORTS, the fate and transport of the contaminants would be primarily controlled by the retardation process. The retardation factor (R_f) for a particular chemical species is the ratio of the rate of contaminant movement to the rate of groundwater movement. R_f is a bulk property for the entire system, combining all the effects of solution chemistry, soil properties, and chemical reactions. Both ion exchange and sorption are the processes that tend to remove specific species from solution and retard their migration through the subsurface. Sorption refers to the process where a contaminant species leaves the solution and is adsorbed onto the surface of a solid, resulting in an increase in the concentration of the contaminant in the soil and a relatively lower concentration in the groundwater. Ion exchange is important in clay minerals that are composed of layered sheets, which can have interlayered ionic species such as Na^+, Ca^{2+}, K^+, and H_2O.

These can exchange with many types of metal ions. The R_f is defined as:

$$R_f = 1 + K_d \frac{\rho_b}{n_e}$$

where: ρ_b = bulk density of the soil (g/cm^3)
n_e = effective porosity of aquifer matrix (ratio)
K_d = soil/water partition coefficient (g/mL).

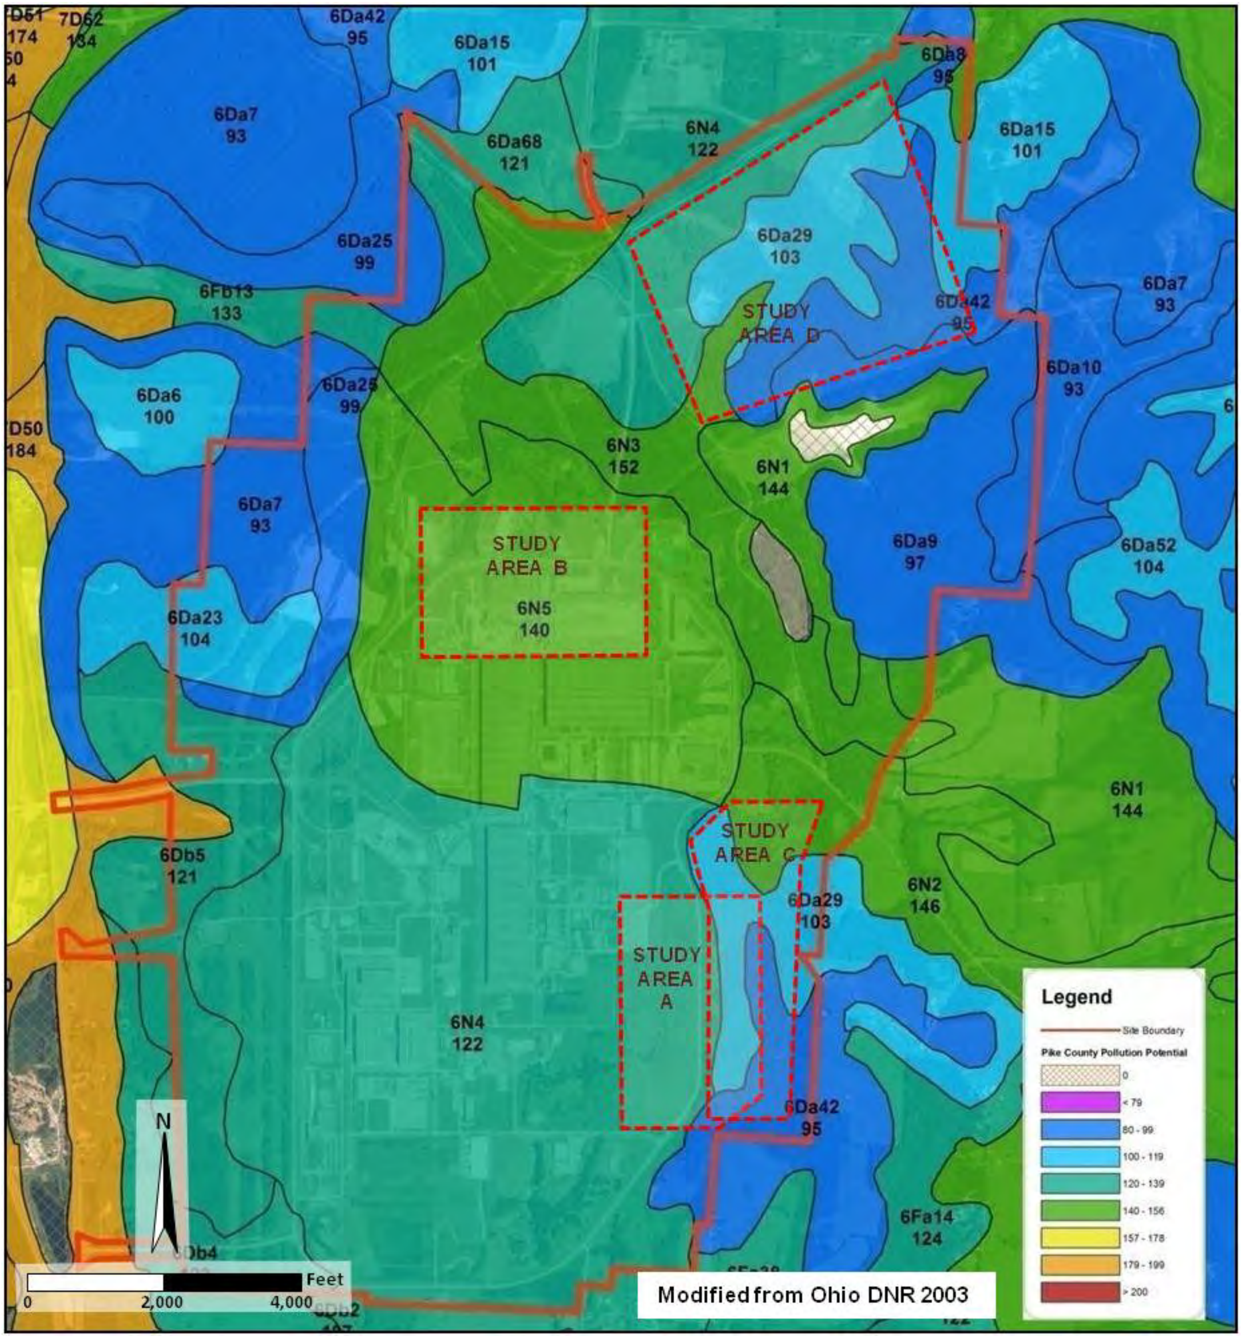

Figure D.10. Pollution Potential Map for the Four Study Areas at PORTS

For a given mass of contaminant, the fraction available for transport with the groundwater is influenced by the adsorptive properties of the soil matrix. The soil/water partition coefficient (K_d) is very important for estimating the potential for adsorption of dissolved contaminants in contact with subsurface media. Because of the retardation process, the movement of the contaminant is generally slow in the unsaturated and groundwater zones for Study Area A where a lot of clayey soil exists for the two zones. With regard to the same contaminant, the K_d for a clayey soil is generally higher than that for a sandy soil.

Contaminant travel times (time at which a constituent reached its peak concentration or dose) were simulated for several constituents as part of the development of preliminary WAC modeling (DOE 2012). The modeling for preliminary WAC considered a potential OSDC with capacities to contain 1 million cy of waste and 3 million cy of waste. Travel times were calculated for constituents (including four inorganic, six organic, and six radionuclide constituents) migrating from the waste mass to specific locations, called points of assessment, downgradient from the conceptual OSDC locations. Table D.1 provides the modeling results for Study Area A. Three compounds (1,1-dichloroethene, methylene chloride, and trichloroethene) had modeled times of peak dose between approximately 600 and 825 years. Radiological constituents such as technetium-99 and uranium had travel times to peak dose of approximately 5,800 years and 47,000 years, respectively. Based on this modeling, most of the contaminants were estimated to migrate downward into the Gallia, then laterally to discharge into Big Run Creek (DOE 2012).

SRC = site-related contaminant

Based on the soil survey of Pike County, three soil types occur within the Study Area A boundary. The predominant soil type is Omulga silt loam (U.S. Department of Agriculture [USDA] 1990). Most of the area west of Perimeter Road is classified as Urban Land-Omulga complex with a 0 to 6 percent slope, which consists of urban land and a deep, nearly level, gently sloping, moderately well-drained Omulga soil in preglacial valleys. The soil in this area has been so disturbed by previous construction activities that assignment of specific soil series is not feasible.

The surface layer of Omulga silt loam is dark grayish-brown, friable, and approximately 10 in. thick. The subsoil is approximately 54 in. thick and is composed of three portions: (1) a yellow-brown, friable silt loam; (2) a fragipan (brittle, compacted subsurface soil) of yellow-brown, mottled, firm, and brittle silty clay loam; and (3) a yellow-brown, mottled, friable silt loam approximately 20 in. thick. Well developed soil horizons may not be present in areas inside Perimeter Road because of cut and fill operations related to plant construction.

Two soil series are present in Study Area A in the upland area east of Perimeter Road. The Rarden series consists of moderately deep, moderately well-drained, slowly permeable soils formed in acid, clayey shale residuum on ridgetops and hillsides. The Coolville series, nearer the top of the ridge, consists of deep, moderately well-drained soils formed in a thin silty mantle weathered from acid shale that has thin strata of siltstone.

D.2.2 SURFACE WATER RESOURCES

There are no perennial streams within or adjacent to Study Area A. The area lies within the headwater area of Big Run Creek. Big Run Creek is the small tributary of the Scioto River that drains the southern portion of the PORTS property. This stream primarily receives outfall effluent from the X-230K South Holding Pond, which is located immediately west of Study Area A, at its headwaters. Big Run Creek flows south-southwest from the area for approximately 4 miles until it intersects the Scioto River. The substrates of Big Run Creek are predominantly gravel and cobble, and the stream channel remains unmodified. Because of the small stream size and high gradient, deep pools are absent (Ohio EPA 1993).

D.2.3 ECOLOGICAL RESOURCES

Study Area A contains forest and managed grasslands that are interspersed with man-made features such as roads and parking areas. Study Area A is primarily managed grassland with a long north-south strip of forest on its east side. In the western portion of Study Area A, managed grassland is dominant. Within this managed grassland, trees line the banks of several short drainage ditches that flow out of Study Area A and into the X-230K Holding Pond. No jurisdictional wetlands or ecologically sensitive areas are located within Study Area A.

There are no endangered species habitat areas, endangered plant species, or exceptional warmwater habitat streams with Study Area A.

D.2.4 CULTURAL RESOURCES

None of the archaeological sites identified at PORTS are located within Study Area A. Also, no architectural resources are present in Study Area A.

D.3 DESCRIPTION OF STUDY AREA B

Study Area B was selected for evaluation primarily because it represents a location impacted by plant operations. This area has low to moderate topographic relief of less than 65 ft with elevations ranging from approximately 635 to 700 ft AMSL (Figure D.11). The majority of the study area has a relief of less than 20 ft with elevations varying from 650 to 670 ft AMSL. This study area is easily accessible by road and railway and is in close proximity to existing utilities necessary for construction and operation of a potential OSDC. Major surface structures within the location include the X-344 facility, four electrical transmission towers, cylinder yards, and a portion of Perimeter Road (approximately 4,500 ft). The potential removal of these structures is part of a separate decision. The X-344 facility may be among the last facilities scheduled for D&D, which would impact construction of a potential OSDC.

Study Area B is the most developed of the four study areas, consisting mostly of man-made features and grassland. The man-made features include numerous buildings, roads, railroad tracks, and other facilities. Development is dense in the southern portion of Study Area B, which is south of Perimeter Road. The northern portion of Study Area B is primarily grassland with a few small stands of trees. Development in Study Area B consists of the X-745G-1/X-745G-2 Cylinder Storage Yard, X-747H Northwest Surplus Scrap Yard, and X-752 Warehouse. The X-206H Parking Lot is located in the south central portion of Study Area B.

D.3.1 GEOLOGY, HYDROGEOLOGY, AND SOILS

Study Area B lies near the center of the ancestral Portsmouth River valley. Stratigraphic units from youngest to oldest in age include the Quaternary Teays Formation (Minford Member/Gallia Member) unconformably overlying the Mississippian to Upper Devonian Sunbury shale, Berea sandstone, and Bedford shale.

The Teays Formation is a 30- to 40- ft-thick unconsolidated unit consisting of fluvial Gallia sand and gravel overlain by Minford clay and silt. The Gallia averages less than 5 ft in thickness and is characterized as reddish-brown, clayey, poorly-sorted, medium-to-coarse sand and gravel. The Gallia reportedly contains an average of 30 percent clay material (Law Engineering 1978). Within Study Area B, the Gallia ranges from 0 to less than 10 ft in thickness. The Minford consists of two units with a gradational contact. The upper unit is predominantly silty clay with some very fine-grained sand, and the lower silt unit is composed of clayey silt and very fine to fine-grained sand. Geotechnically, the Minford consists primarily of overconsolidated lean clays and silts (Law Engineering 1978).

The Gallia is not present in the east-central portion of Study Area B because the bedrock has a higher elevation. Figure D.12 shows the configuration of the top of the bedrock surface within Study Area B and demonstrates the higher bedrock in the eastern portion of the study area. The depth to bedrock varies from less than 20 ft on the eastern portion of the study area to greater than 30 ft in the western half of the area. The Teays Formation directly overlies the Sunbury shale across the eastern portion of the study area. However, the Sunbury has been removed by erosion along the western portion of the study area, and the Teays Formation directly overlies the Berea.

Stratigraphic relationships at Study Area B are shown in Figures D.13 and D.14, which present south-to-north and west-to-east cross sections, respectively. These cross sections illustrate the discontinuous nature of the Gallia across Study Area B and also the nature of the unconformity on the Sunbury and Berea. North of the study area, Little Beaver Creek has cut through the Berea sandstone into the underlying Bedford shale.

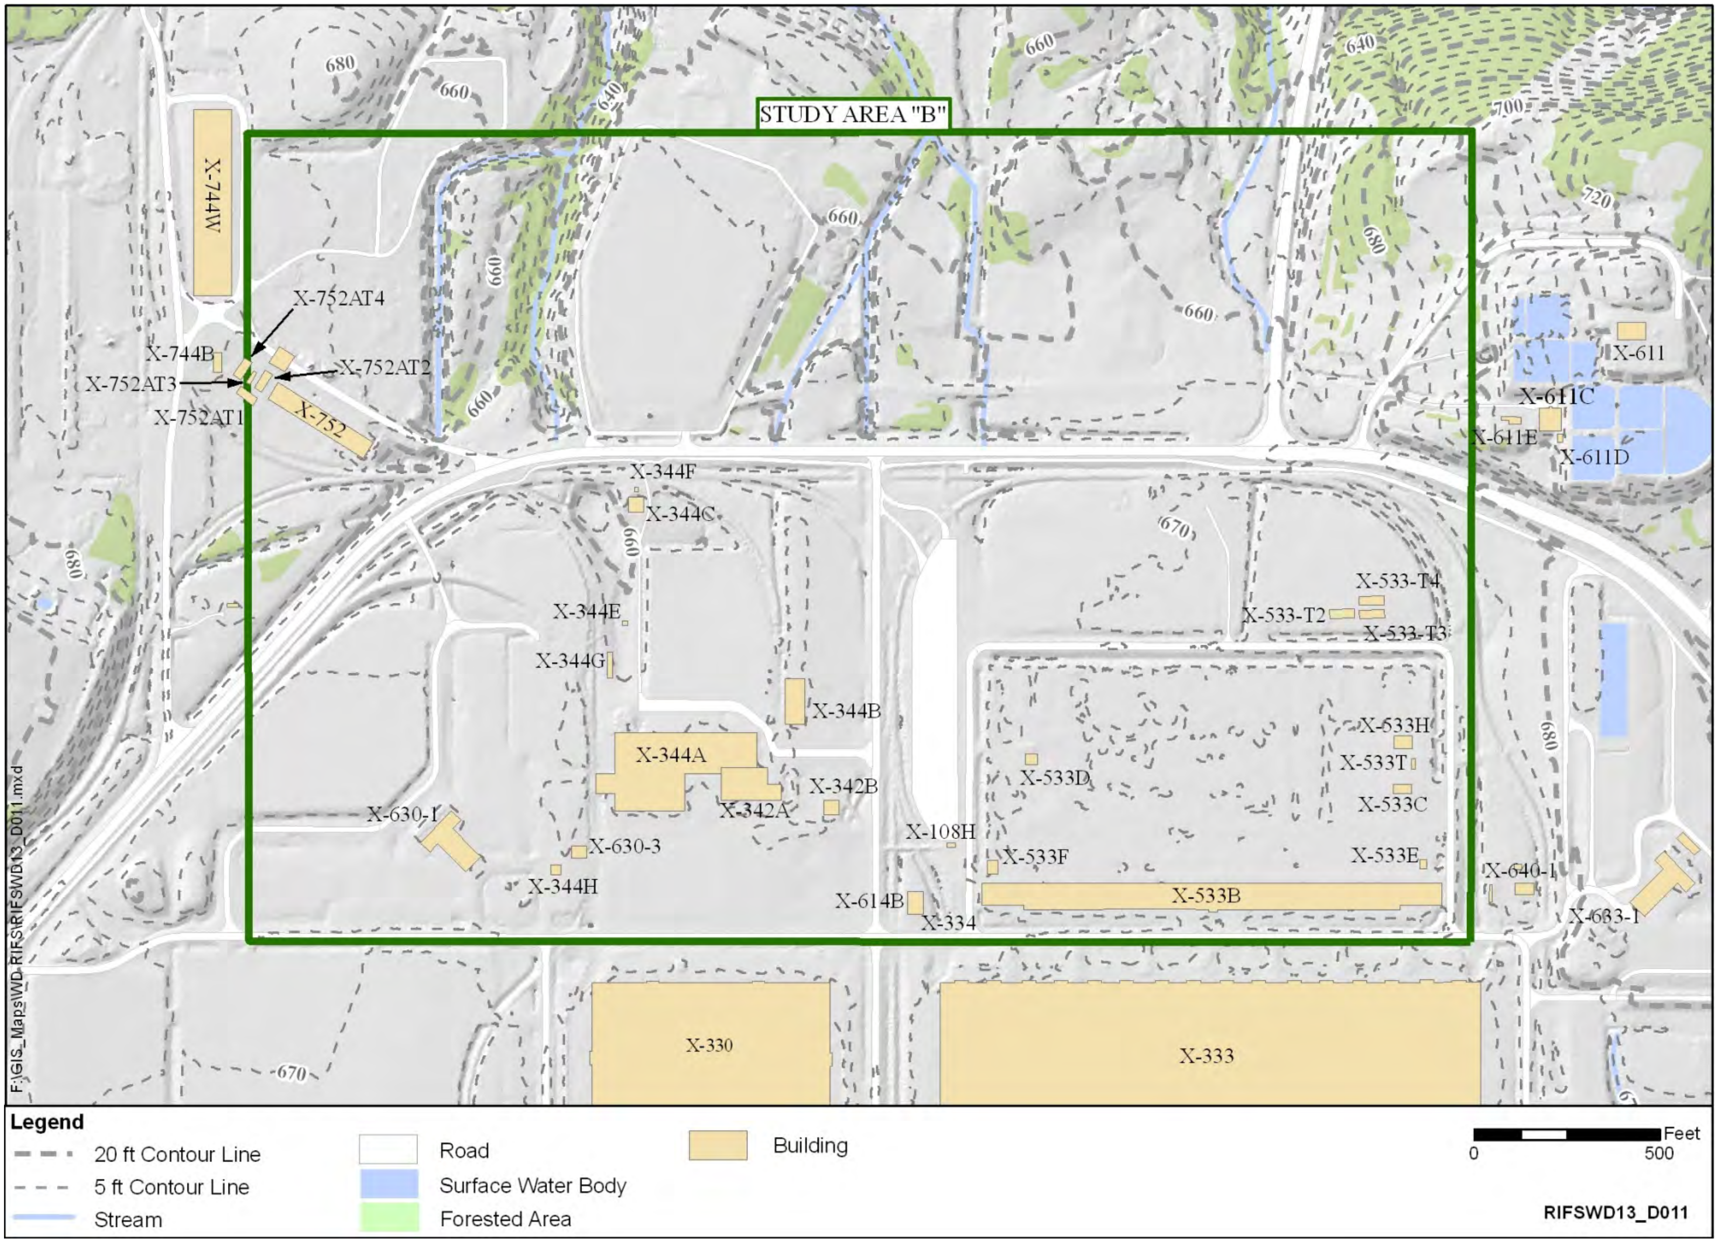

Figure D.11. Topography of Study Area B at PORTS

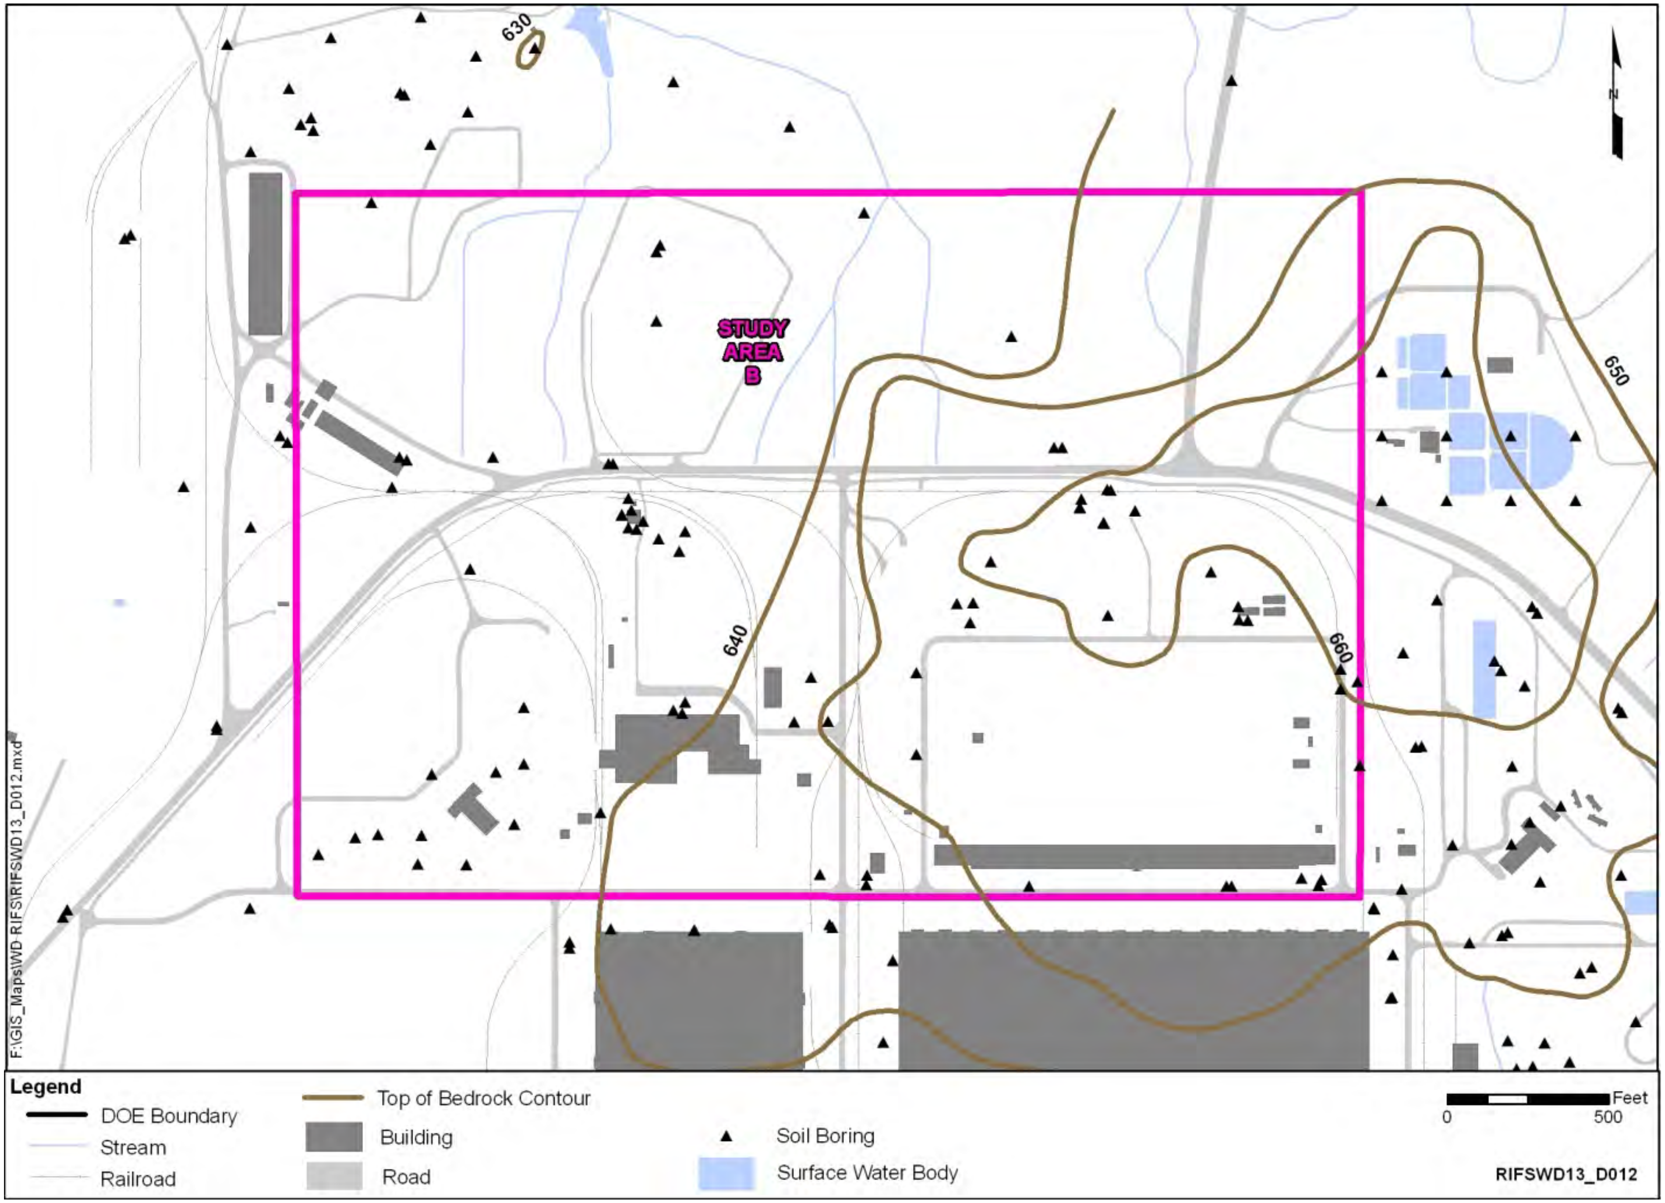

Figure D.12. Top of Bedrock in Study Area B at PORTS

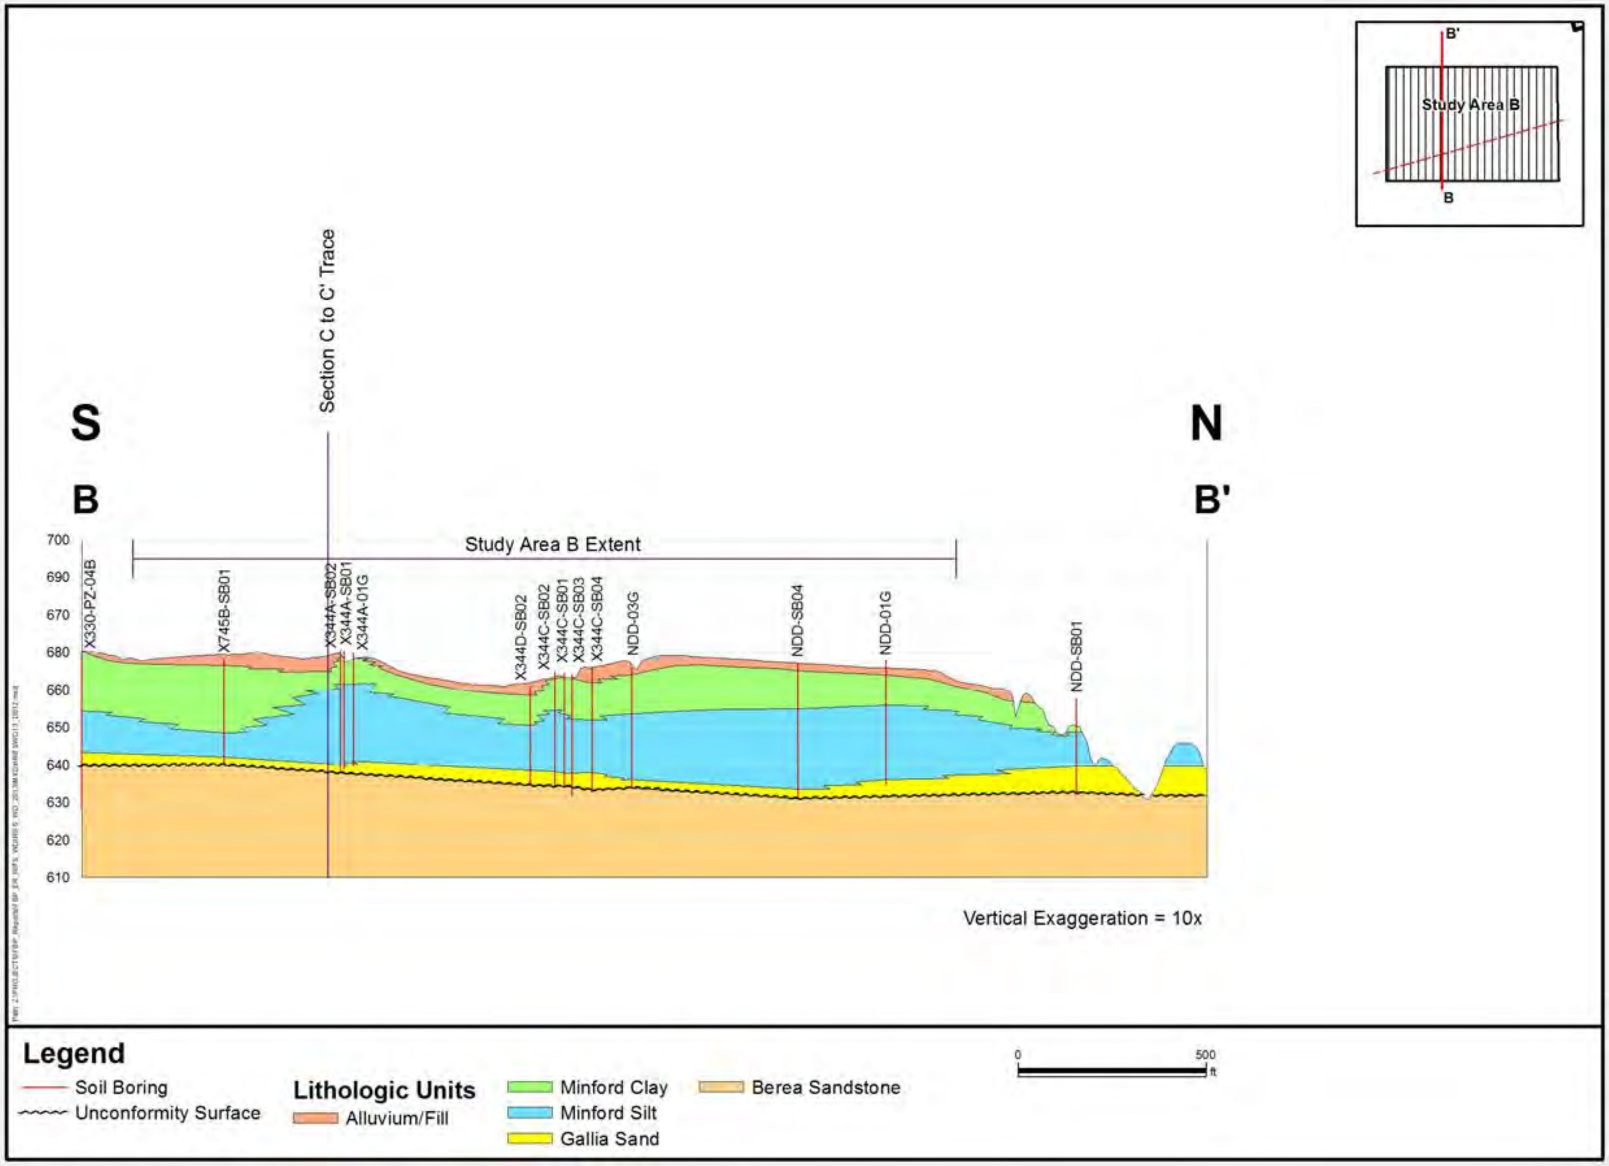

Figure D.13. South to North Geologic Cross Section of Study Area B at PORTS

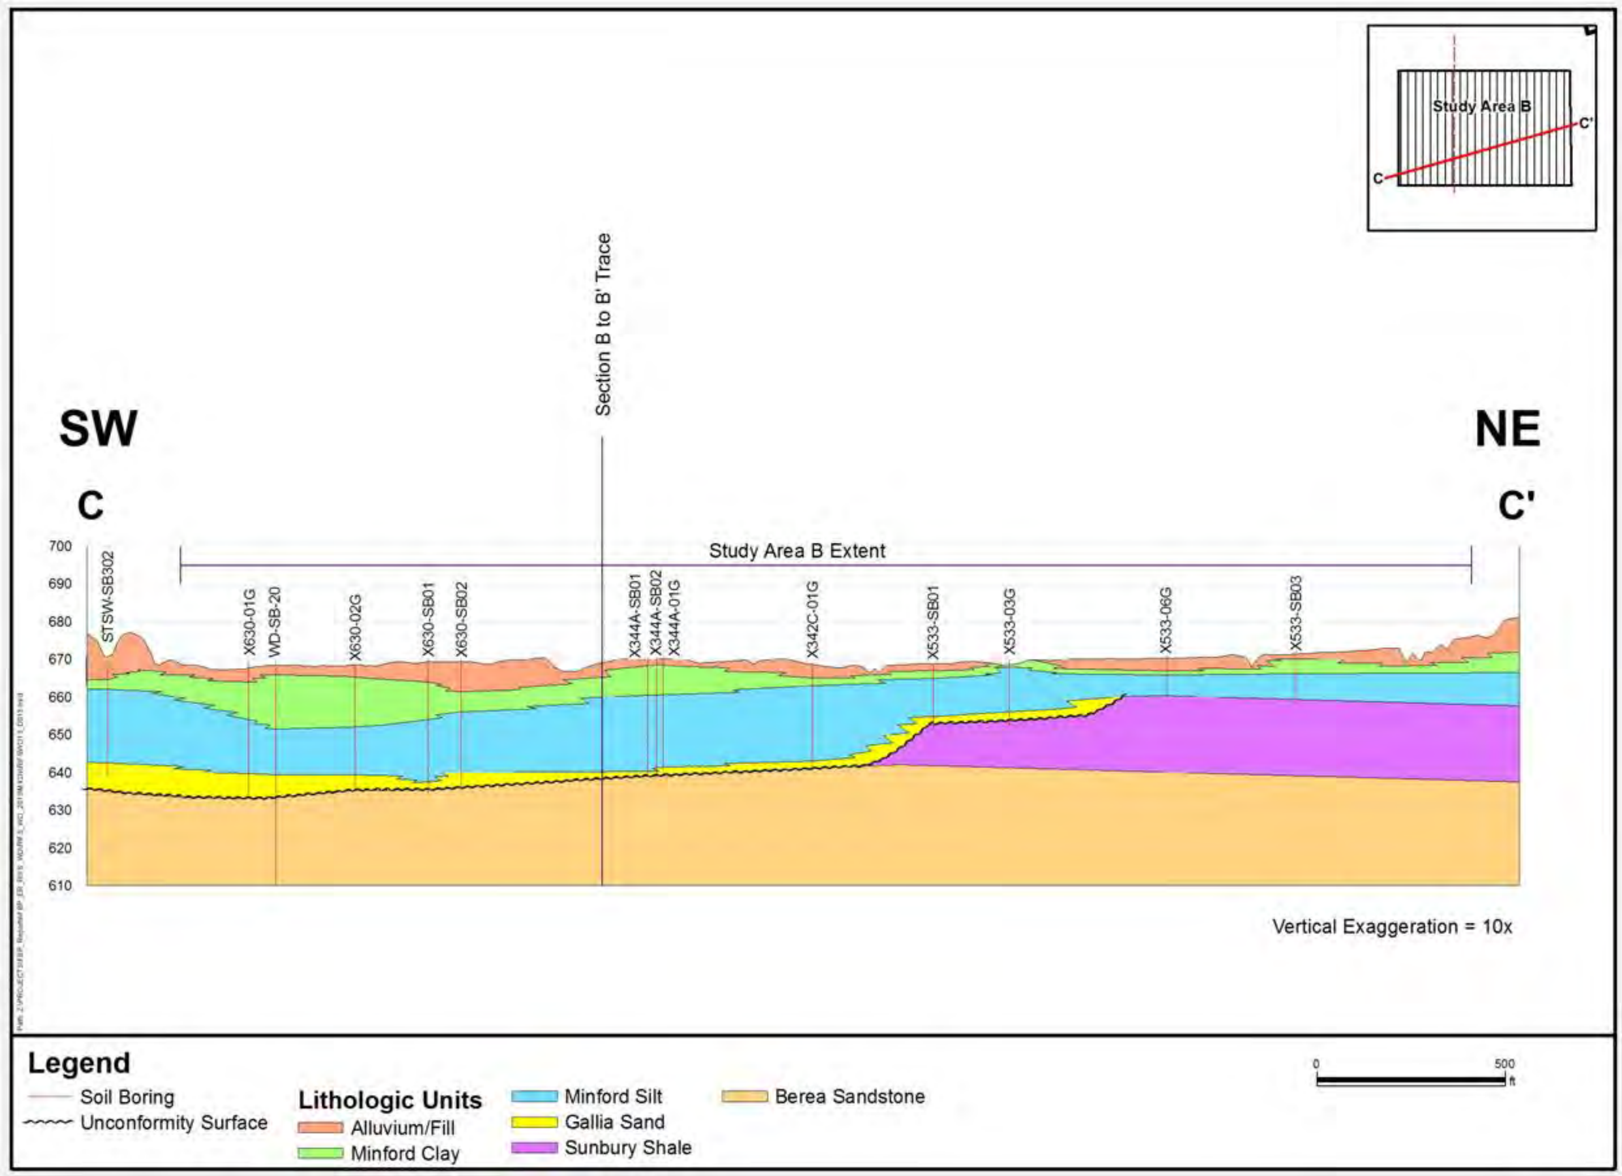

Figure D.14. West to East Geologic Cross Section of Study Area B at PORTS

The groundwater flow system at Study Area B includes the aquifers consisting of the unconsolidated Gallia sand and gravel and the Berea sandstone, along with the aquitards of Sunbury shale and unconsolidated Minford clay and silt. The basal portion of the Minford is generally grouped with the Gallia to form the uppermost aquifer and primary water-bearing unit within this study area. Groundwater flow in Study Area B is strongly controlled by the presence of surface drainages and bedrock highs (DOE 1996d). Little Beaver Creek is the surface water receptor for groundwater in both the Gallia and Berea in the area.

Groundwater flow in the Gallia (Figure D.15) is essentially parallel to that in the Berea (Figure D.16) with flow generally to the north towards Little Beaver Creek, and to a lesser extent, toward portions of the North Drainage Ditch. Both Figures D.15 and D.16 represent the potentiometric surfaces for the third quarter 2012 (DOE 2013). The depth to the Gallia potentiometric surface in Study Area B is approximately 8 to 15 ft below surface. Because the Berea underlies the Sunbury shale, groundwater flow in the Berea is unaffected by the bedrock high of the Cuyahoga Shale on the eastern end of the study area. The hydraulic gradient in the Gallia is low (ranging from approximately 0.01 ft/ft to 0.005 ft/ft) with the steeper gradients existing closer to the discharge areas. The downward vertical hydraulic gradient from the Gallia to the Berea is approximately 0.35 ft/ft in the area of the former X-533A Switchyard, but overall in and around the study area, the potentiometric surfaces of the Gallia and Berea are at similar levels. Upward gradients from the Berea into the Gallia are observed where the Sunbury shale is absent (DOE 1996d) and closer to Little Beaver Creek. Groundwater flow in the Berea is north to northeast towards Little Beaver Creek with a gradient averaging approximately 0.01 ft/ft (Figure D.16). The seasonal fluctuations of the potentiometric surfaces for both the Gallia and the Berea are less than 5 ft.

The pollution potential map (Figure D.10) indicates that Study Area B, which (1) is underlain by the Minford and Gallia, (2) has a higher recharge, and (3) would have faster contaminant travel times, has a higher relative pollution potential (140) than the other three study areas. Both ion exchange and sorption are important processes that tend to remove specific contaminant species from solution and retard their migration through the subsurface. Similar to the situation in Study Area A, because of these retardation processes, the movement of contaminants is generally slow in the unsaturated and groundwater zones for Study Area B where a lot of clayey soil exists in the two zones.

Modeling for the preliminary WAC at Study Area B (Table D.2) provided similar results as discussed previously for Study Area A. Three compounds (1,1-dichloroethene, methylene chloride, and trichloroethene) had modeled times of peak dose between approximately 500 and 725 years, slightly faster than travel times at Study Area A. Radiological constituents, such as technetium-99 and uranium, had travel times to peak dose of approximately 4,700 years and 40,000 years, respectively. Based on the modeling, most of the contaminants were estimated to migrate downward into the Gallia, then laterally to discharge into Little Beaver Creek (DOE 2012).

Based on the soil survey of Pike County, the predominant soil type within Study Area B is Omulga silt loam (USDA 1990). Most of the area is classified as Urban Land-Omulga complex with a 0 to 6 percent slope, which consists of urban land and a deep, nearly level, gently sloping, moderately well-drained Omulga soil in preglacial valleys. The soil in this area has been so disturbed by previous construction activities that assignment of specific soil series is not feasible.

D.3.2 SURFACE WATER RESOURCES

There are no perennial streams within Study Area B. The area lies within the drainage area of Little Beaver Creek, which drains the eastern and northern portions of the area before discharging into Big Beaver Creek. Little Beaver Creek is a small, high-gradient, unmodified stream that receives the majority of its flow from the X-230J7 East Holding Pond discharge through the East Drainage Ditch. Little Beaver Creek also receives effluent via the Northeast Drainage Ditch through the outfall from the X-230J6 Northeast Holding Pond and via the North Drainage Ditch through the outfall from the X-230L North Holding Pond. Substrates are predominantly slab boulders and bedrock at the upper reach to gravel and sand near the mouth of the stream. During parts of the year, intermittent flow conditions exist upstream from the X-230J7 discharge. During the summer/fall low-flow time of the year, the upstream section is composed of shallow, isolated pools with intermittent flow (Ohio EPA 2006).

D.3.3 ECOLOGICAL RESOURCES

Study Area B, particularly the southern portion, is highly developed. Managed grassland is dominant among the various man-made features. A few isolated stands of trees are present within the grassland in the northern portion of Study Area B.

Three jurisdictional wetlands (Q4-18, Q4-22, and Q4-26) are located partially or entirely within Study Area B. The wetlands in Study Area B are described in Table D.3 (LMES 1996).

Table D.3. Wetlands in Study Area B

Q4-18	Jurisdictional	0.322	North Access Road	Drainage ditch
Q4-22	Jurisdictional	0.018	X-745G Cylinder Yard	Drainage ditch
Q4-26	Jurisdictional	0.160	X-752 Warehouse	Man-made ditch

Source: LMES 1996

LMES = Lockheed Martin Energy Systems, Inc.

No endangered species habitat areas or endangered plant species are present in Study Area B; no endangered or threatened fish species are present within the boundaries of Study Area B. Little Beaver Creek, which is classified as meeting exceptional warmwater criteria in some reaches, is outside Study Area B. Study Area B drains to Little Beaver Creek.

D.3.4 CULTURAL RESOURCES

None of the archaeological sites identified on the PORTS Facility are located within Study Area B.

Study Area B is the most densely developed of the four study areas, particularly in the portion south of Perimeter Road; therefore, it contains numerous architectural resources. Many of these have been demolished in recent times, but a number of architectural resources are still present in Study Area B.

D.4 DESCRIPTION OF STUDY AREA C

Study Area C was selected as a location for evaluation primarily because of the underlying hydrogeology. Study Area C is mostly underlain by Cuyahoga Shale, and its topographic relief (approximately 135 ft) may provide a separation of the water table from the bottom liner of a potential OSDC by more than 50 ft, required by 40 *Code of Federal Regulations* (*CFR*) 761.75(b)(3). The study area topography ranges from approximately 660 to 795 ft AMSL (Figure D.3). This area does not contain any buildings or structures in a land-use conflict area or scheduled for D&D, reindustrialization and reuse, or future redevelopment infrastructure. This location is relatively close to the East and South Access Roads.

The land in Study Area C consists almost entirely of upland forest. An isolated area of managed grassland is present along the western boundary of this study area, and small areas of grassland occupy the northern portion of it. Segments of unimproved roads are the only development features in Study Area C.

No major roads are present within Study Area C. Short segments of unimproved roads are the only transportation infrastructure in this study area.

D.4.1 GEOLOGY, HYDROGEOLOGY, AND SOILS

Study Area C lies on a ridge outside the eastern edge of the ancestral Portsmouth River valley. Stratigraphic units from youngest to oldest in age include the Mississippian to Upper Devonian Cuyahoga Formation, Sunbury shale, Berea sandstone, and Bedford shale. The Quaternary Teays Formation

(Minford Member/Gallia Member) unconformably overlies the bedrock within the ancestral valley and pinches out on the western and northern flanks of the ridge.

Figure D.6 shows the configuration of the top of the bedrock surface within Study Area C and prominently indicates the edge of the ancestral valley against the ridge that is prominent within Study Area C. The depth to bedrock is shallow in Study Area C, ranging from less than 10 ft to approximately 20 ft deep on the western and northern boundaries. The Cuyahoga is overlain by a combination of a thin veneer of Minford silt/clay (on the western portion) and regolith on the bedrock. The topographic ridge in Study Area C is underlain by the Cuyahoga Formation. The maximum thickness of the Cuyahoga Formation is approximately 140 ft where the ridge is at its greatest height.

The Cuyahoga Formation is a medium gray, hard, thinly bedded shale with occasional thin (0.5 in. to 1 ft) fine-grained sandstone and siltstone lenses and layers. The Cuyahoga Formation is underlain by the Sunbury shale, which is approximately 20 to 25 ft thick. The Berea sandstone, with an average thickness of approximately 35 ft in the PORTS area, lies beneath the Sunbury shale. The Berea is composed of a light gray, hard, thickly bedded, fine-grained sandstone with thin shale laminations. The bedrock formations dip gently to the east-southeast at approximately 30 ft/mile. Stratigraphic relationships are shown in Figure D.7.

Based on drilling in the Cuyahoga Formation in Study Area C, three zones of weathering can be recognized in the shale. The upper zone is characterized as regolith (comprised of a lean clay residual soil mixed with colluvium) that generally extends from less than 10 ft to 20 ft in depth and does not retain any of the parent shale structural characteristics. The top of the bedrock is at the base of this regolith zone. The second weathering zone is highly weathered shale that is light tan to brown in color. In this zone, although the rock structure (bedding and jointing) is still evident, the shale is very weak and generally can be broken by hand. (Auger drilling typically hits refusal at the base of this zone.) The thickness of this second zone is approximately 10 ft. The third zone of weathering consists of moderately weathered shale and extends to 30 ft below the surface. This zone exhibits tan to brown bands of weathered shale that parallel both sides of some bedding planes and/or joints, with alternating intervals of unweathered gray shale. The top of the unweathered shale has been placed at the point where the shale becomes continuously gray in color with depth and significant weathering along joints or fractures no longer occurs. Although jointing or fracturing was evident in the weathered zones, joints/fractures were less prevalent in the unweathered shale.

The groundwater flow system at Study Area C includes the groundwater system in the shallow regolith and the Berea sandstone aquifer, along with the aquitards of the Cuyahoga Formation, Sunbury shale, and Bedford shale. Natural recharge to the groundwater flow system comes mainly from precipitation, although land use and the presence of the bedrock shale units effectively reduce recharge to underlying units. Discharge of groundwater to the surface occurs primarily along streams that transect the plant. Natural recharge to the central portion of the plant is approximately 4 to 7 in./year whereas recharge in the uplands such as those at Study Area C (areas underlain by shale bedrock) is 2 to 4 in./year (ODNR 2003). The recharge is less in the uplands due to topography (steeper slopes promoting runoff) and low permeability of the bedrock and residual clayey soil in the regolith. Most of the water that infiltrates through the regolith likely moves laterally upon reaching the base of the deeply weathered zone due to the very low vertical permeability of the Cuyahoga Formation (1×10^{-3} to 1×10^{-6} ft/day). A couple of historical shallow-dug wells were found in Study Area C, and the depth to water in one of these wells, which had a total depth of approximately 28 ft, was approximately 14 ft below surface. (The other well, with a total depth of almost 13 ft, remained dry after existing water was removed.) These wells are completed in the regolith/weathered bedrock zone.

In areas where stress-relief fractures occur in the Cuyahoga Formation, some of the groundwater moves downward from the regolith to provide recharge to the deeper bedrock system. (In test pits, the more brittle sandstone layers were observed to have vertical fractures that did not extend into the overlying or underlying shale.) In a previous test trench located approximately 2,000 ft southwest of Study Area C, a few joints were visible only in the moderately weathered shale. The joints had preferred strikes of about north 50° west, and joint spacing varied from approximately 5 ft to greater than 25 ft. A continuous 1-ft-thick sandstone at approximately 672 ft AMSL was described as highly fractured. Groundwater that migrates into the fractures eventually migrates laterally along the joints or sandstone layers and likely emerges as ephemeral seeps along the hillside downgradient from the recharge areas.

Four piezometers were drilled into the Cuyahoga Formation/Sunbury Formation. The Cuyahoga/Sunbury piezometers (as well as adjacent, temporary air-rotary-drilled borings) at Study Area C often had too little water to allow a water level measurement. Only piezometers WD-PZ04C and WD-PZ05C have shown significant water level fluctuations, which were 22.3 ft and 6.2 ft, respectively. The large fluctuations in water levels in WD-PZ04C suggest this piezometer may be in hydraulic connection with a fracture/joint that is also in connection with the regolith zone. On the other hand, piezometers WD-PZ06C and WD-PZ07C exhibit water level fluctuations of only 1.1 ft and 0.5 ft, respectively. The three air-rotary borings adjacent to WD-PZ04C, WD-PZ06C, and WD-PZ07C never had sufficient water to allow a depth-to-water measurement.

Groundwater flow in the Berea is northwest to southeast with a gradient varying from approximately 0.004 to 0.007 ft/ft (Figure D.9). Seasonal fluctuation of the Berea's potentiometric surface is typically less than 2 ft with no change in groundwater flow direction. While groundwater yield in the Berea is typically lower than the yield in the Gallia, the Berea is a widespread unit and is considered to be a regional aquifer.

The estimated hydraulic conductivity of the Sunbury shale is based on numerical groundwater modeling with ranges from 1.6×10^{-4} to 9.6×10^{-4} ft/day (DOE 2009). The vertical hydraulic conductivity of the Sunbury shale is assumed to be an order of magnitude lower than its horizontal hydraulic conductivity. (Samples collected from Study Areas C and D yielded a vertical hydraulic conductivity of 1.2×10^{-5} ft/day.) Permeability testing on samples from the deeper Bedford shale yielded an average value of approximately 8.2×10^{-2} ft/day (Law Engineering 1978). The hydraulic conductivity determined by single-well aquifer tests of the Berea sandstone ranges from 4.5×10^{-3} to 15.0 ft/day with a mean value of 0.16 ft/day. The higher hydraulic conductivity tends to occur in areas west of the study area where the Sunbury shale is absent.

The pollution potential map of Pike County (ODNR 2003) indicates that most of Study Area C, which is underlain by shale, has a relative pollution potential ranging from 95 to 103. This would be expected because the unconsolidated Gallia does not exist over most of Study Area C, and the permeability of the shale bedrock reduces the overall recharge in that area. The extreme northern portion of the study area has a higher pollution potential where the Minford/Gallia exists. The rate of groundwater flow, and potential contaminant migration, vertically through the Cuyahoga Formation and Sunbury shale is expected to be very slow.

The pollution potential of the area can also be related to contaminant fate and transport migration within the subsurface at the study area. The travel time for any contaminant to migrate from a potential OSDC to an exposure point is a function of the properties of the unsaturated and aquifer zones as well as the contaminant-specific chemical properties.

Because of the presence of the thick shale and abundance of clay minerals within the unsaturated zone at Study Area C, the retardation processes for contaminants are much more predominant than they are at either Study Areas A or B. The movement of the contaminants is likely to be much slower in the unsaturated zone than at Study Areas A and B. Therefore, because of the thick shale bedrock, Study Area C will provide greater protection to groundwater than Study Areas A and B. As shown in Table D.4, modeling for the preliminary WAC indicated travel times for peak dose to the DOE property boundary for some of the more highly mobile organic compounds to take greater than 2,000 years (compared to less than 1,000 years for Study Areas A and B). The time to peak dose for technetium-99 was approximately 24,500 years and uranium was greater than 150,000 years (DOE 2012). The modeling indicated the contaminants would migrate slowly downward through the Cuyahoga and Sunbury Shale and eventually reach the Berea Sandstone.

Based on the soil survey of Pike County, three soil types occur within the Study Area C boundary (USDA 1990). Two soil series are present in the upland area that makes up the topographic ridge. The Rarden series consists of moderately deep, moderately well-drained, slowly permeable soils formed in acid, clayey shale residuum on ridgetops and hillsides. The Coolville series, nearer the top of the ridge, consists of deep, moderately well-drained soils formed in a thin, silty mantle weathered from acid shale that has thin strata of siltstone.

The third soil type is Omulga silt loam. The surface layer of Omulga silt loam is dark grayish-brown, friable, and approximately 10 in. thick. The subsoil is approximately 54 in. thick and is composed of three portions: (1) a yellow-brown, friable silt loam; (2) a fragipan (brittle, compacted subsurface soil) of yellow-brown, mottled, firm, and brittle silty clay loam; and (3) a yellow-brown, mottled, friable silt loam approximately 20 in. thick. The extreme northern area of Study Area C is classified as Urban Land-Omulga complex with a 0 to 6 percent slope, which consists of urban land and a deep, nearly level, gently sloping, moderately well-drained Omulga soil in preglacial valleys. The soil in this area has been disturbed by previous construction activities.

D.4.2 SURFACE WATER RESOURCES

No perennial streams are within or adjacent to Study Area C. A topographic ridge is present along this study area. It acts as a drainage divide with surface water originating on the western portion flowing toward Big Run Creek and that originating on the eastern portion flowing to Little Beaver Creek. There are three small ponds, which may be related to former farmsteads. These ponds, which seasonally contain standing water, appear to be man-made (excavated) features. They may also be considered wetlands although previous wetland surveys did not identify them as such.

Big Run Creek is the small tributary of the Scioto River that drains the southern portion of the PORTS property. This stream primarily receives outfall effluent from the X-230K South Holding Pond, which is located west of Study Area C. Big Run Creek flows south-southwest from the area for approximately 4 miles until it intersects the Scioto River. The substrates of Big Run Creek are predominantly gravel and cobble, and the stream channel remains unmodified. Because of the small stream size and high gradient, deep pools are absent (Ohio EPA 1993).

Little Beaver Creek is a small, high-gradient, unmodified stream that receives the majority of its flow from the X-230J7 East Holding Pond discharge through the East Drainage Ditch. Substrates are predominantly slab boulders and bedrock at the upper reach to gravel and sand near the mouth of the stream. During parts of the year, intermittent flow conditions exist upstream from the X-230J7 discharge. During the summer/fall low-flow time, the upstream section is composed of shallow, isolated pools with intermittent flow (Ohio EPA 2006).

D.4.3 ECOLOGICAL RESOURCES

Study Area C is almost entirely upland forest with small zones of grassland to the north and west. No wetlands have been identified in Study Area C. No endangered species habitat areas or endangered plant species are present in Study Area C. Preliminary findings from a detailed habitat mapping study being performed by Ohio University indicate Indiana bat habitat may be more extensive than identified in previous studies. The primary trees that produce exfoliating bark and nesting cavities (e.g., sycamore and shagbark hickory) are abundant in the older forest habitats, including forest habitats in Study Area C (Ohio University 2012). Figure D.17 shows the results of the preliminary habitat mapping in Study Area C. There are no endangered or threatened fish species or exceptional warmwater streams within the boundaries of Study Area C.

D.4.4 CULTURAL RESOURCES

Five of the 36 archaeological sites identified during the 1996-1997 Phase I archaeological survey are located within Study Area C. New archaeological sites were identified as a result of recent Phase I investigations in Study Area C. Of the 10 newly-identified sites, six consist of isolated finds and do not have the potential to yield additional data significant to the prehistory or history of the region. At one site, several prehistoric and historical artifacts were collected, but based on the lack of an intact cultural context, the site was not recommended as eligible for NRHP. The three remaining newly-identified sites date to the historic period and require no further investigation since they yielded low-density artifact scatter. No sites eligible for listing on the NRHP are in Study Area C.

No architectural resources are present in Study Area C.

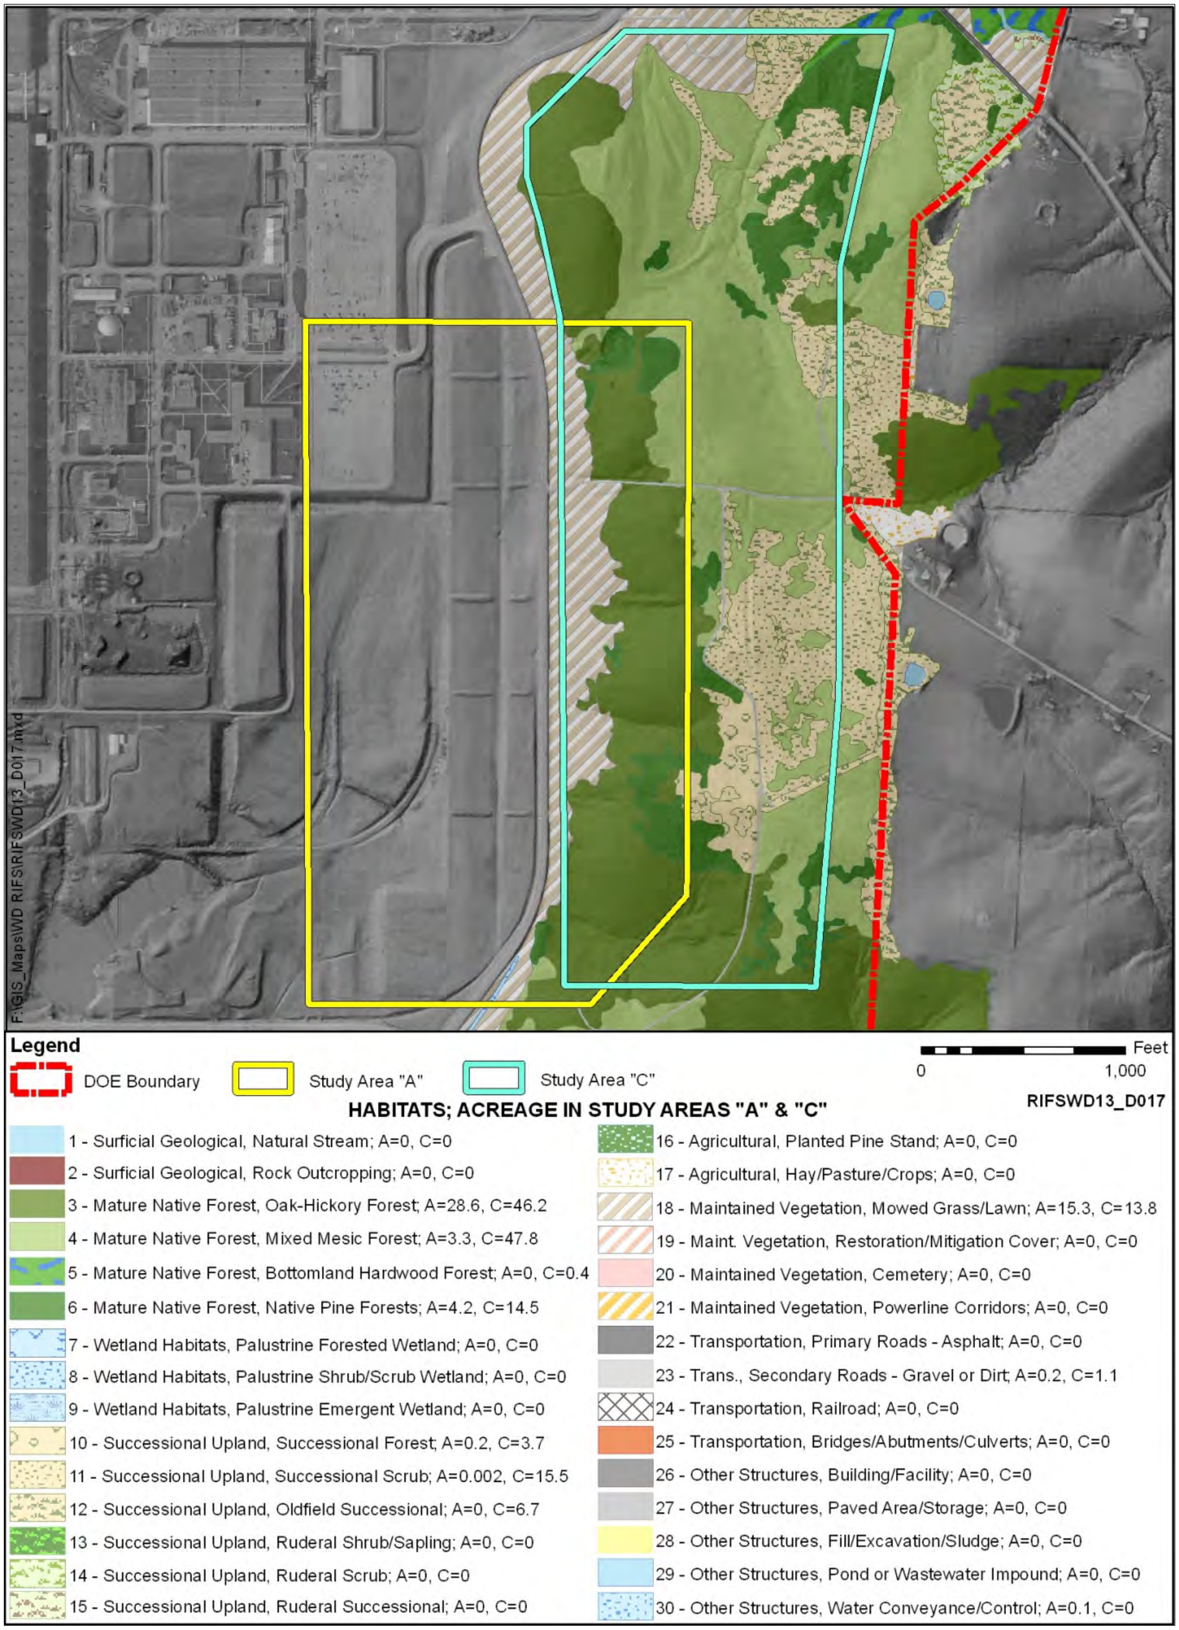

Figure D.17. Preliminary Habitats for Study Areas A and C

D.5 DESCRIPTION OF STUDY AREA D

Study Area D was selected as a location for evaluation primarily because of the underlying geology and the remote location relative to the developed portion of PORTS, despite its having a potential future land use for industrial development. Study Area D has moderate topographic relief of approximately 145 ft (elevations range from approximately 640 to a little more than 780 ft AMSL) (Figure D.18) and is mostly underlain by Cuyahoga shale. Therefore, it may provide a separation of the water table from the bottom liner of a potential OSDC per 40 *CFR* 761.75(b)(3). This area does not contain any buildings or structures except for the X-114A New Firing Range, which is identified to be demolished early.

Study Area D contains minimally developed land and consists primarily of forest growth and grassland. The only developed land consists of the X-114A New Firing Range near its center, the access road to the firing range, and two unimproved roads.

Study Area D contains most of the access road to the X-114A Firing Range. The only other transportation features are two unimproved roads and a railroad just outside the northern boundary.

D.5.1 GEOLOGY, HYDROGEOLOGY, AND SOILS

Study Area D lies in an upland area predominantly outside the ancestral Portsmouth River valley. Stratigraphic units from youngest to oldest in age include the Mississippian to Upper Devonian Cuyahoga Formation, Sunbury shale, Berea sandstone, and Bedford shale. The Quaternary Teays Formation (Minford Member/Gallia Member) unconformably overlies the bedrock within the ancestral valley and pinches out on the western and northern flanks of the uplands.

Figure D.19 is a block diagram illustrating the general surface and subsurface geologic units at Study Area D. The northern and western portions are underlain by the Minford/Gallia whereas most of the study area is underlain by the Cuyahoga Formation. The depth to bedrock in Study Area D ranges from less than 10 ft in the upland areas to up to 40 ft deep on the western and northern boundaries. The Cuyahoga Formation is overlain by a combination of a thin veneer of Minford silt/clay and regolith on the bedrock. The average depth to competent bedrock (based on auger refusal) at Study Area D was approximately 13 ft. The average depth of weathering within the Cuyahoga Formation, based primarily on color change in the rock core, was 22 ft. Figure D.20 shows the approximate elevation of the top of competent bedrock at Study Area D. The maximum thickness of the Cuyahoga Formation is estimated to be up to 120 ft where the uplands are at their greatest height. The Cuyahoga Formation is a moderately hard, thinly laminated shale with sandstone laminations. Unlike the geology at Study Area C, the Cuyahoga at Study Area D contains numerous thin (less than 3-in.-thick) sandstone layers, and borings indicate a 2-ft-thick sandstone layer at an approximate elevation of 680 ft AMSL. This layer is continuous across the study area and a thinner (0.4-ft-thick), mostly continuous sandstone is commonly found approximately 2 ft below this layer.

The 680-ft sandstone layer is continuous away from the study area except where it has been removed by erosion in the deeper valleys, such as the Big Beaver Creek valley northeast of the study area. This 2-ft-thick sandstone layer may be correlated to the 5-ft-thick “670 Sandstone Unit” at the Pike Sanitation, Inc. landfill located approximately 5 miles north-northwest of Study Area D. (Both units occur 30 to 40 ft above the contact between the Cuyahoga and Sunbury.) Figure D.21 shows the extent and top elevation of the 680-ft sandstone layer at Study Area D.

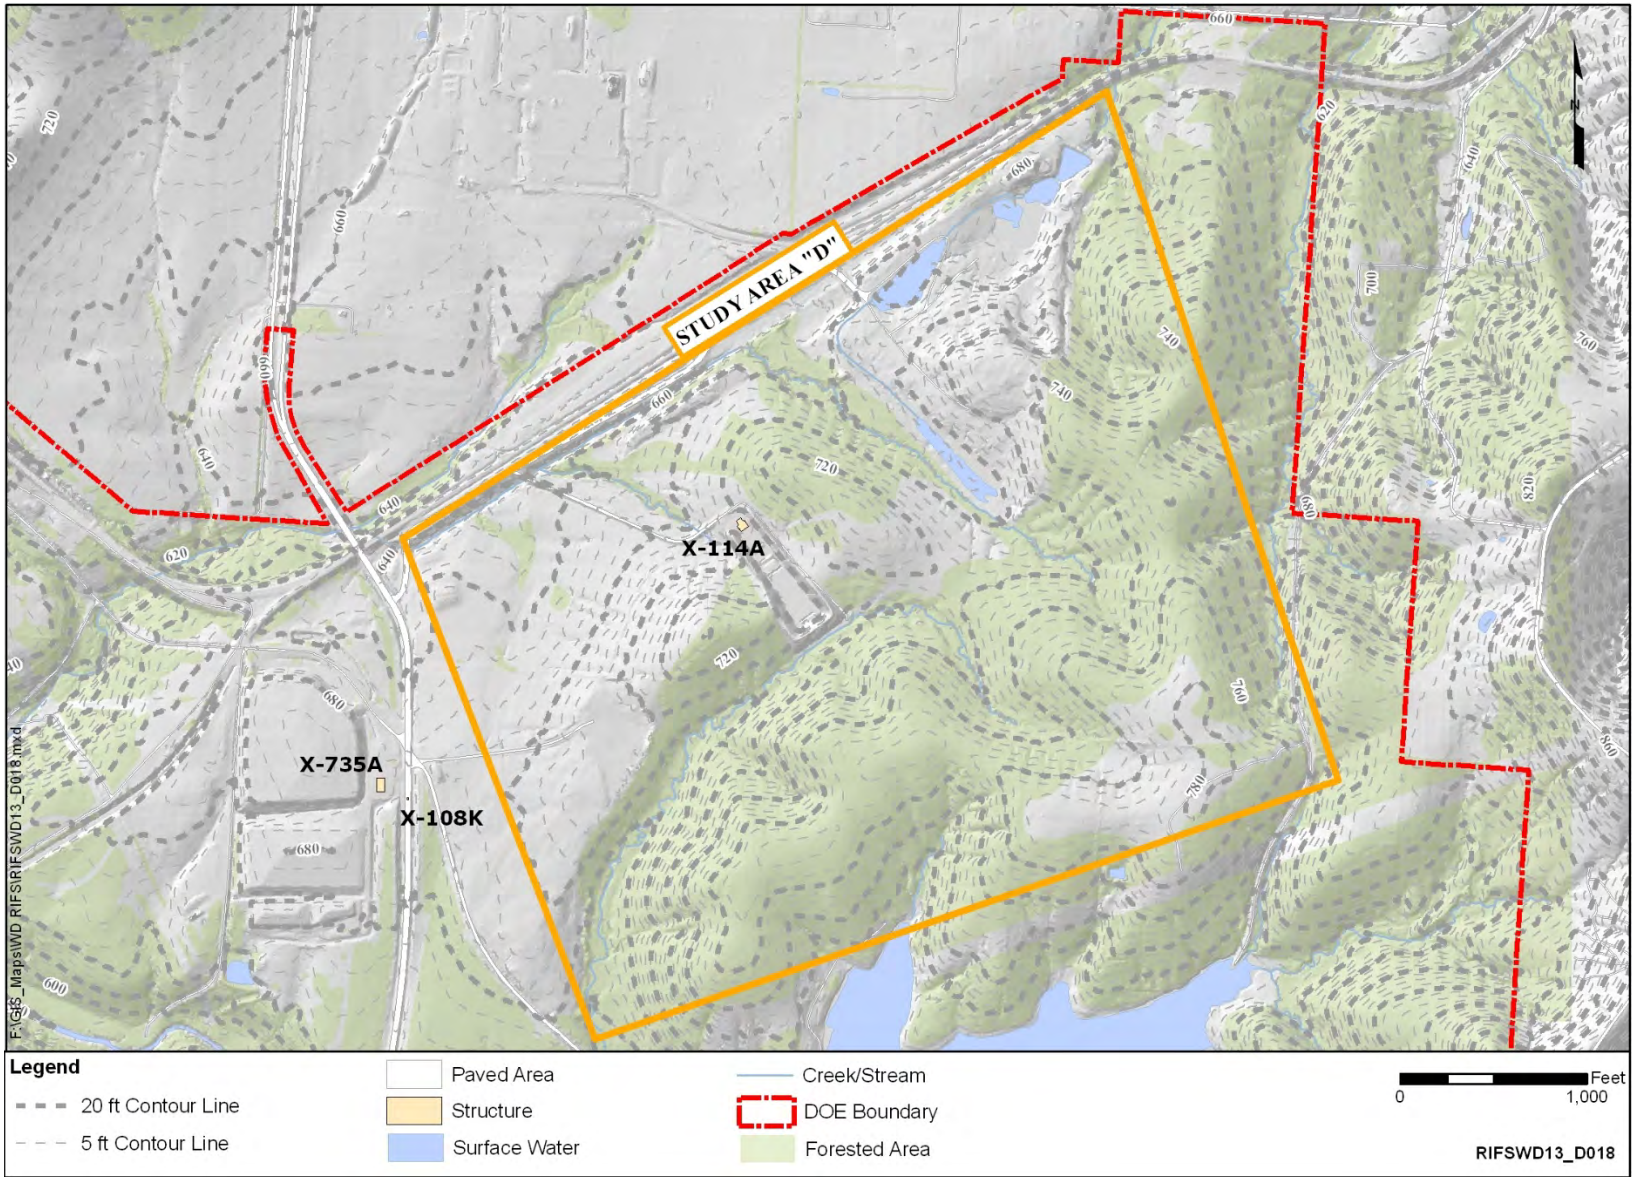

Figure D.18. Topography of Study Area D at PORTS

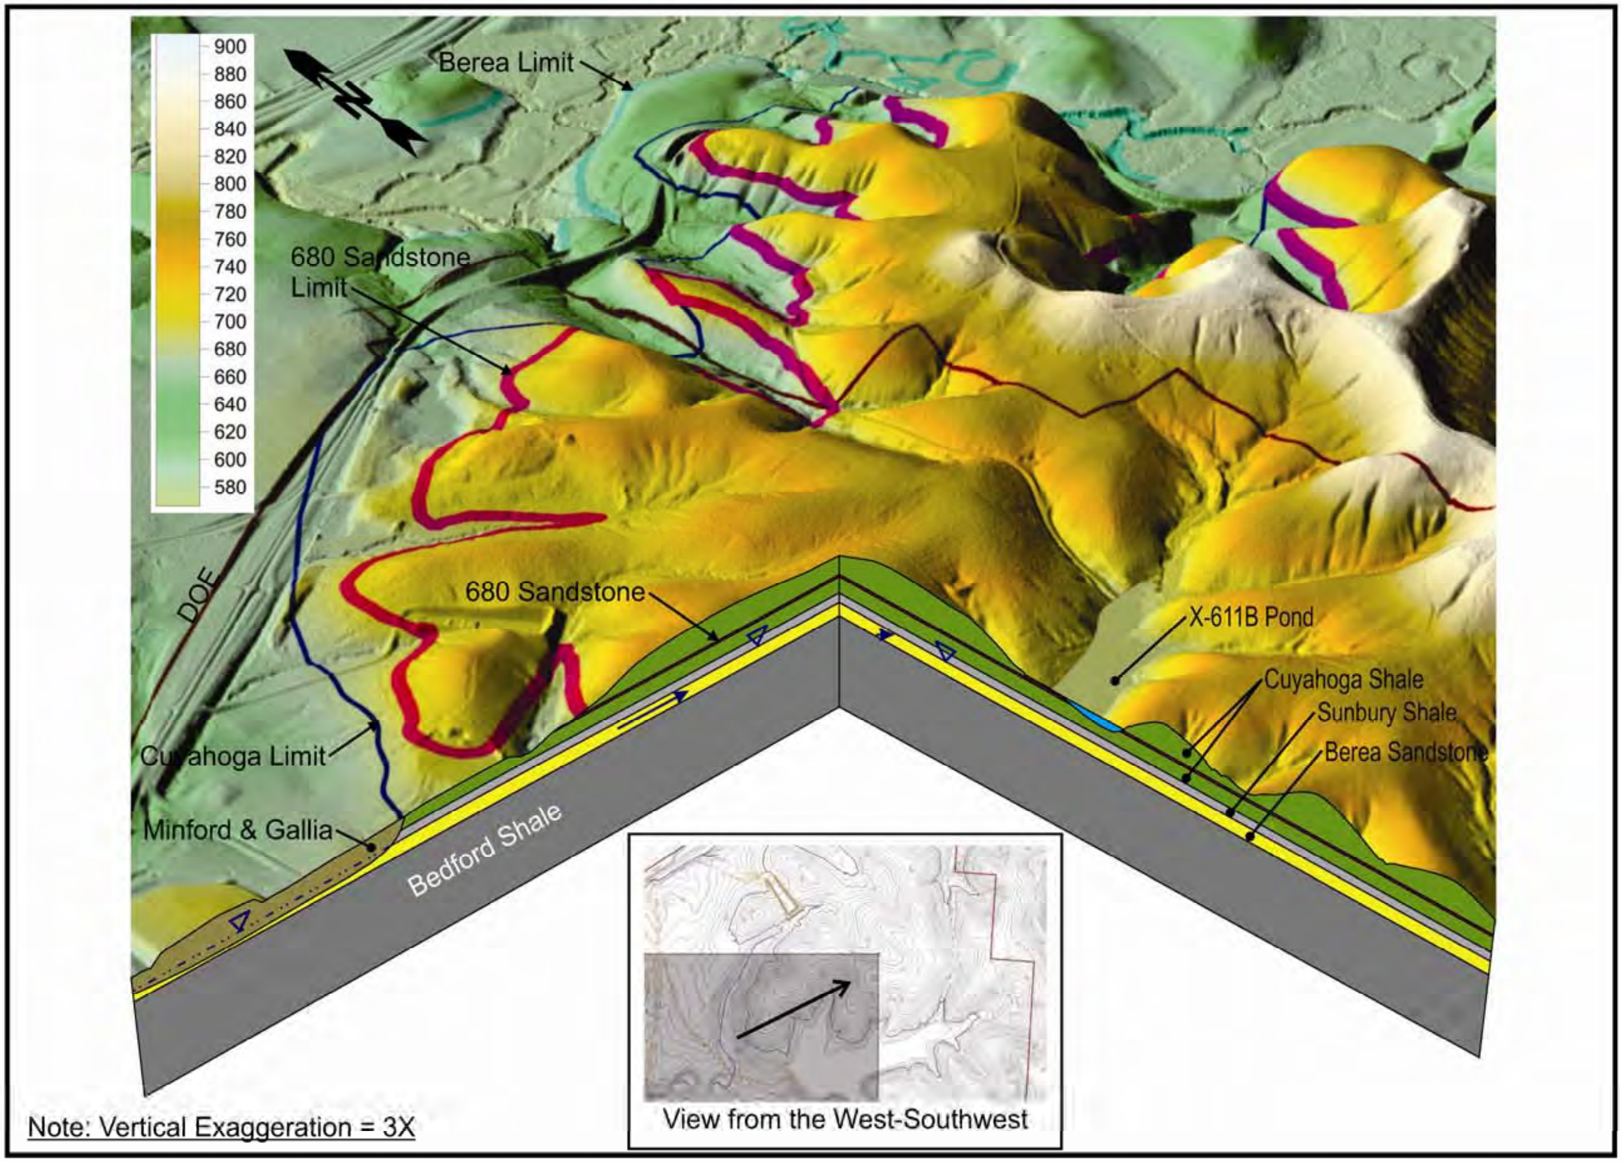

Figure D.19. Geology of Study Area D at PORTS

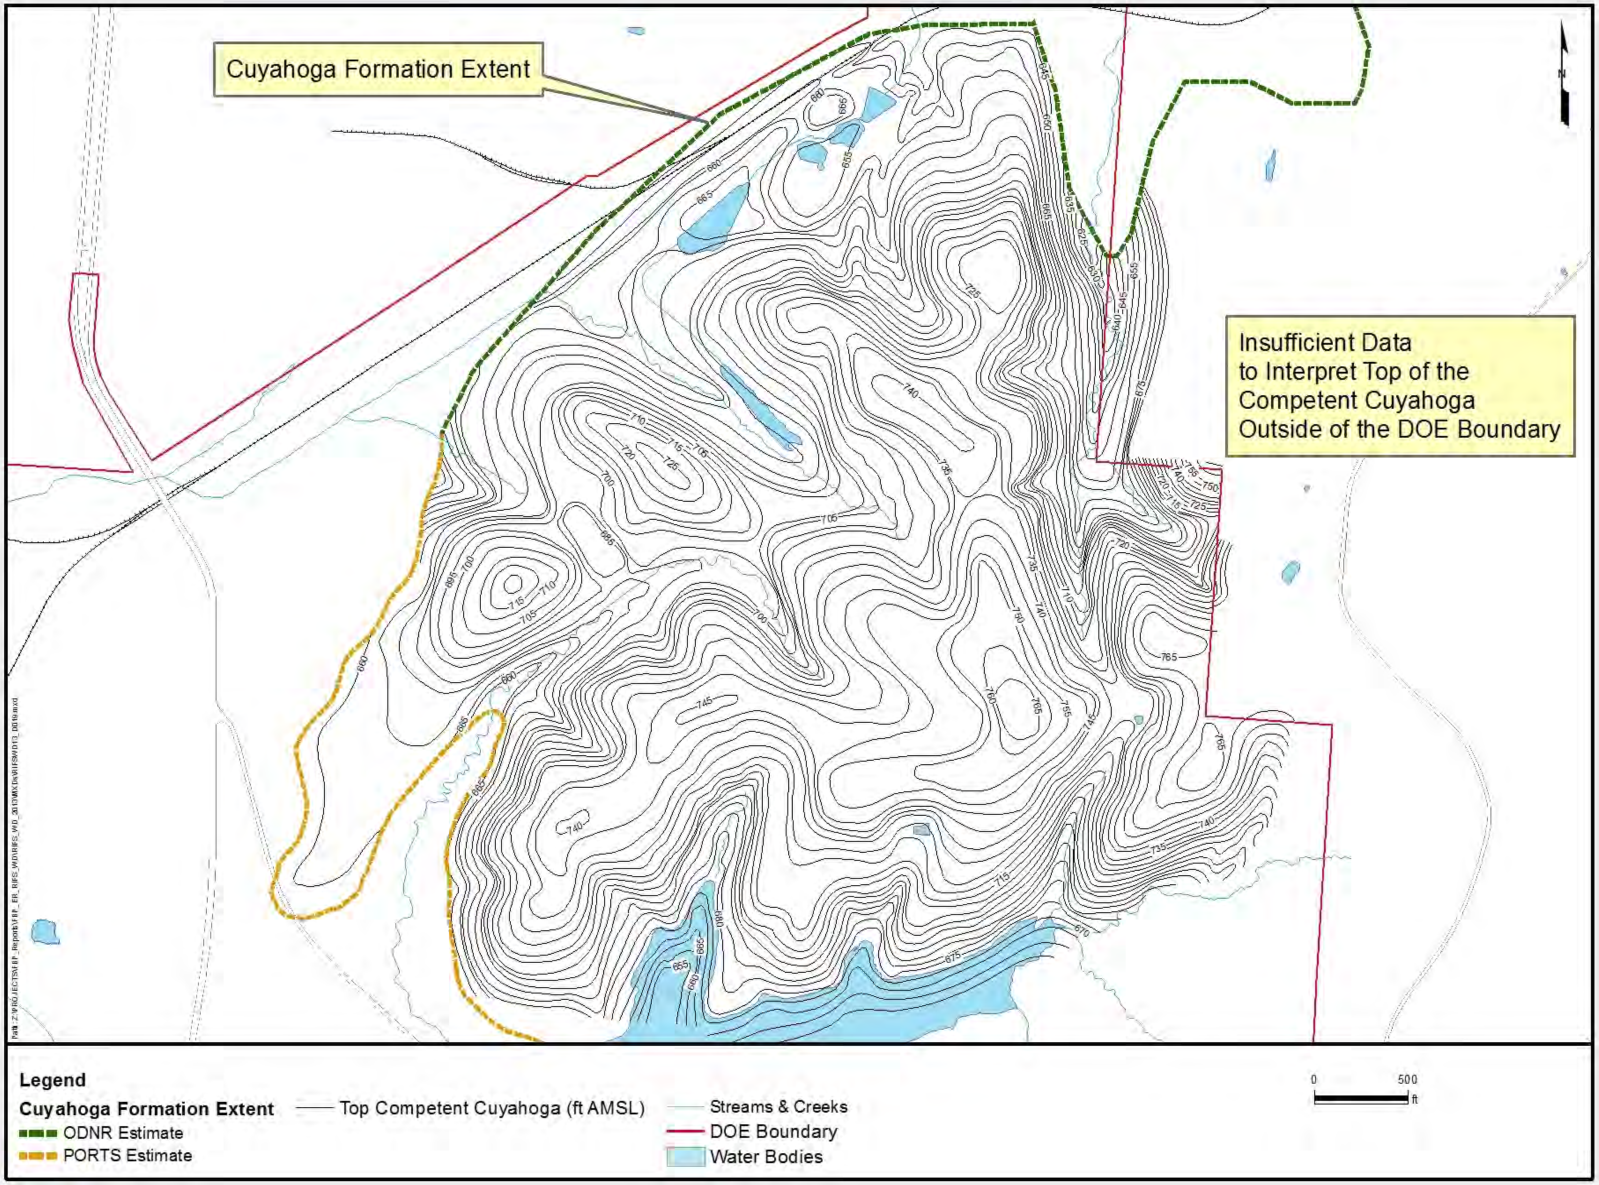

Figure D.20. Elevation of the Top of Competent Bedrock in Study Area D at PORTS

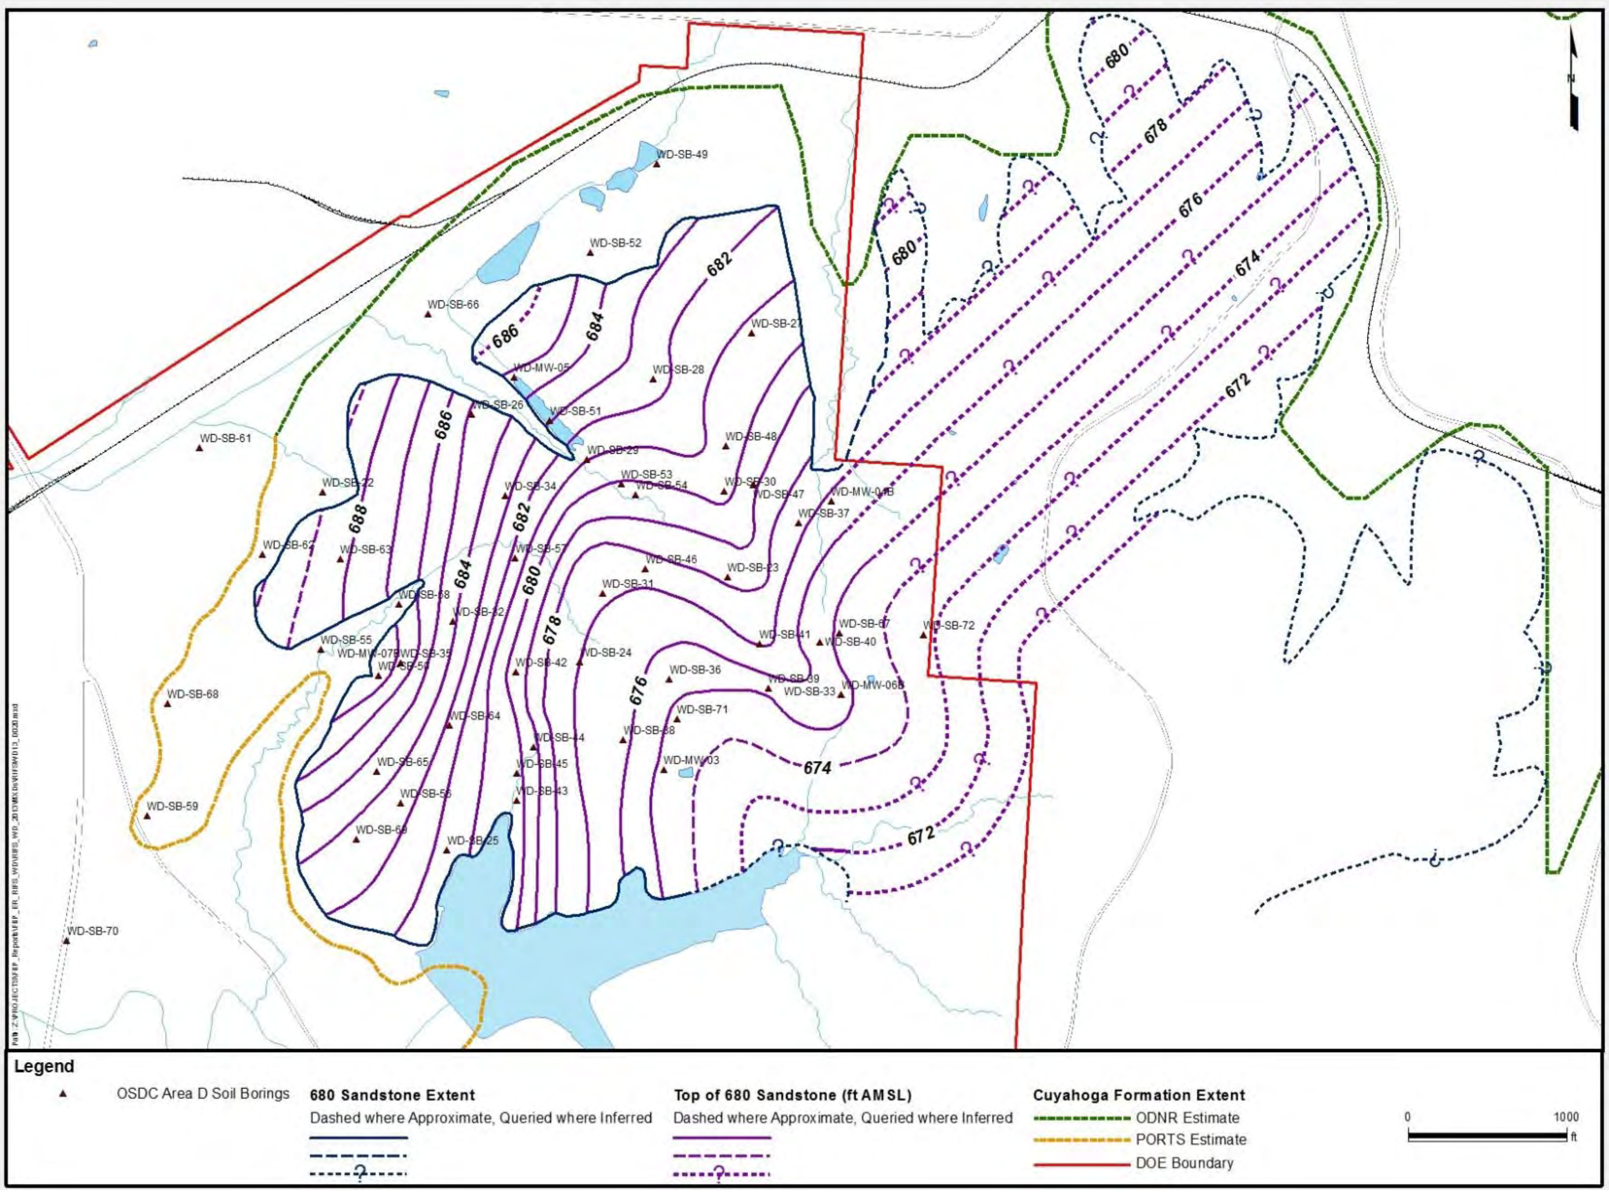

Figure D.21. Elevation of the Top of the 680-ft Sandstone Layer in the Cuyahoga Formation at Study Area D at PORTS

The Cuyahoga Formation also contains other thin sandstone layers with several layers occurring near the 720-ft AMSL horizon. These upper Cuyahoga Formation sandstones have been grouped into geologic facies, based on the presence of the different sandstone lenses (Figure D.22). These sandstone units are thinner than the 680-ft sandstone layer and are not readily correlated from one boring to the next. The thickness of the individually significant sandstone layers in the 720-ft sandstone lens zone ranges from 0.3 to 1.5 ft with an average of 0.5 ft. Several borings intersected multiple sandstone layers in this zone with WD-SB-36 intersecting five separate sandstone layers between 715 ft AMSL and 725 ft AMSL. There were a few locations where these lenses had a thickness of 1 ft or greater (borings WD-SB-23, WD-SB-33, WD-SB-65, WD-SB-69, and WD-SB-71). While this “zone” is fairly continuous across the study area, the individual sandstone lenses that comprise this zone are difficult to correlate from boring to boring and do not appear to be continuous across Study Area D.

If Study Area D is selected as the location for a potential OSDC, most of these upper sandstone lenses would be removed during construction. Figure D.23 is a histogram illustrating the thickness of all sandstone lenses encountered between 700 ft and 740 ft AMSL in soil borings in Study Area D. This figure shows that almost 75 percent of all the lenses encountered were 0.2-ft thick or less. The two thickest lenses occurred highest up in the stratigraphic sequence (a 1.5-ft-thick sandstone in WD-SB-46 at approximately 730 ft AMSL and a 1.9-ft-thick sandstone in WD-SB-42 at approximately 735 ft AMSL).

The various sandstone lenses and layers in the Cuyahoga Formation represent deposition during a series of regressive and transgressive marine events in Early Mississippian time, approximately 350 million years before present (Coogan 1996). During that time, this part of Ohio was a marginal marine environment with highlands to the east (Acadian Highlands) and north (along the Cincinnati Platform), shedding sediment to the coast by a series of stream systems.

The Cuyahoga Formation is composed of sequences of marine shales and interbedded terrestrial sandstones, with the vertical profile resembling modern sediments deposited along a prograding shoreline or in a delta. In Study Area D, the Cuyahoga contains thick gray shales and fine-grained interbedded sandstones and siltstones. As one moves stratigraphically higher in the Cuyahoga, the rocks are characterized by more frequent sandstone layers and lenses, representing the advancing near-shore environments.

The Cuyahoga is then underlain by the Sunbury shale (approximately 20 ft thick) and the Berea sandstone (average thickness of approximately 35 ft) in the PORTS area. The Berea is composed of a light gray, hard, thickly bedded, fine-grained sandstone with thin shale laminations. The Berea sandstone overlies the Bedford shale.

The geologic structure of the study area is relatively simple with the bedrock formations dipping gently to the east-southeast at approximately 30 ft/mile. Figures D.24 and D.25 show site-specific geologic cross sections across the area where a potential OSDC might be located. Two distinct joint sets are present in outcrops of thin sandstone laminations in the Cuyahoga Formation and the lower Berea/upper Bedford Formations at PORTS. The joint sets strike northeast (N65°E) and northwest (N25°W) (DOE 1996d).

The groundwater flow system at Study Area D includes the aquifers consisting of the unconsolidated Gallia sand and gravel and the Berea sandstone, along with the aquitards of Cuyahoga/Sunbury shale, Bedford shale, and unconsolidated Minford clay and silt. The basal portion of the Minford is generally grouped with the Gallia to form the uppermost aquifer and primary water-bearing unit at PORTS. (This also represents the uppermost aquifer system in the northwestern portion of Study Area D.)

Figure D.24. Detailed Geologic Cross Section for Study Area D at PORTS

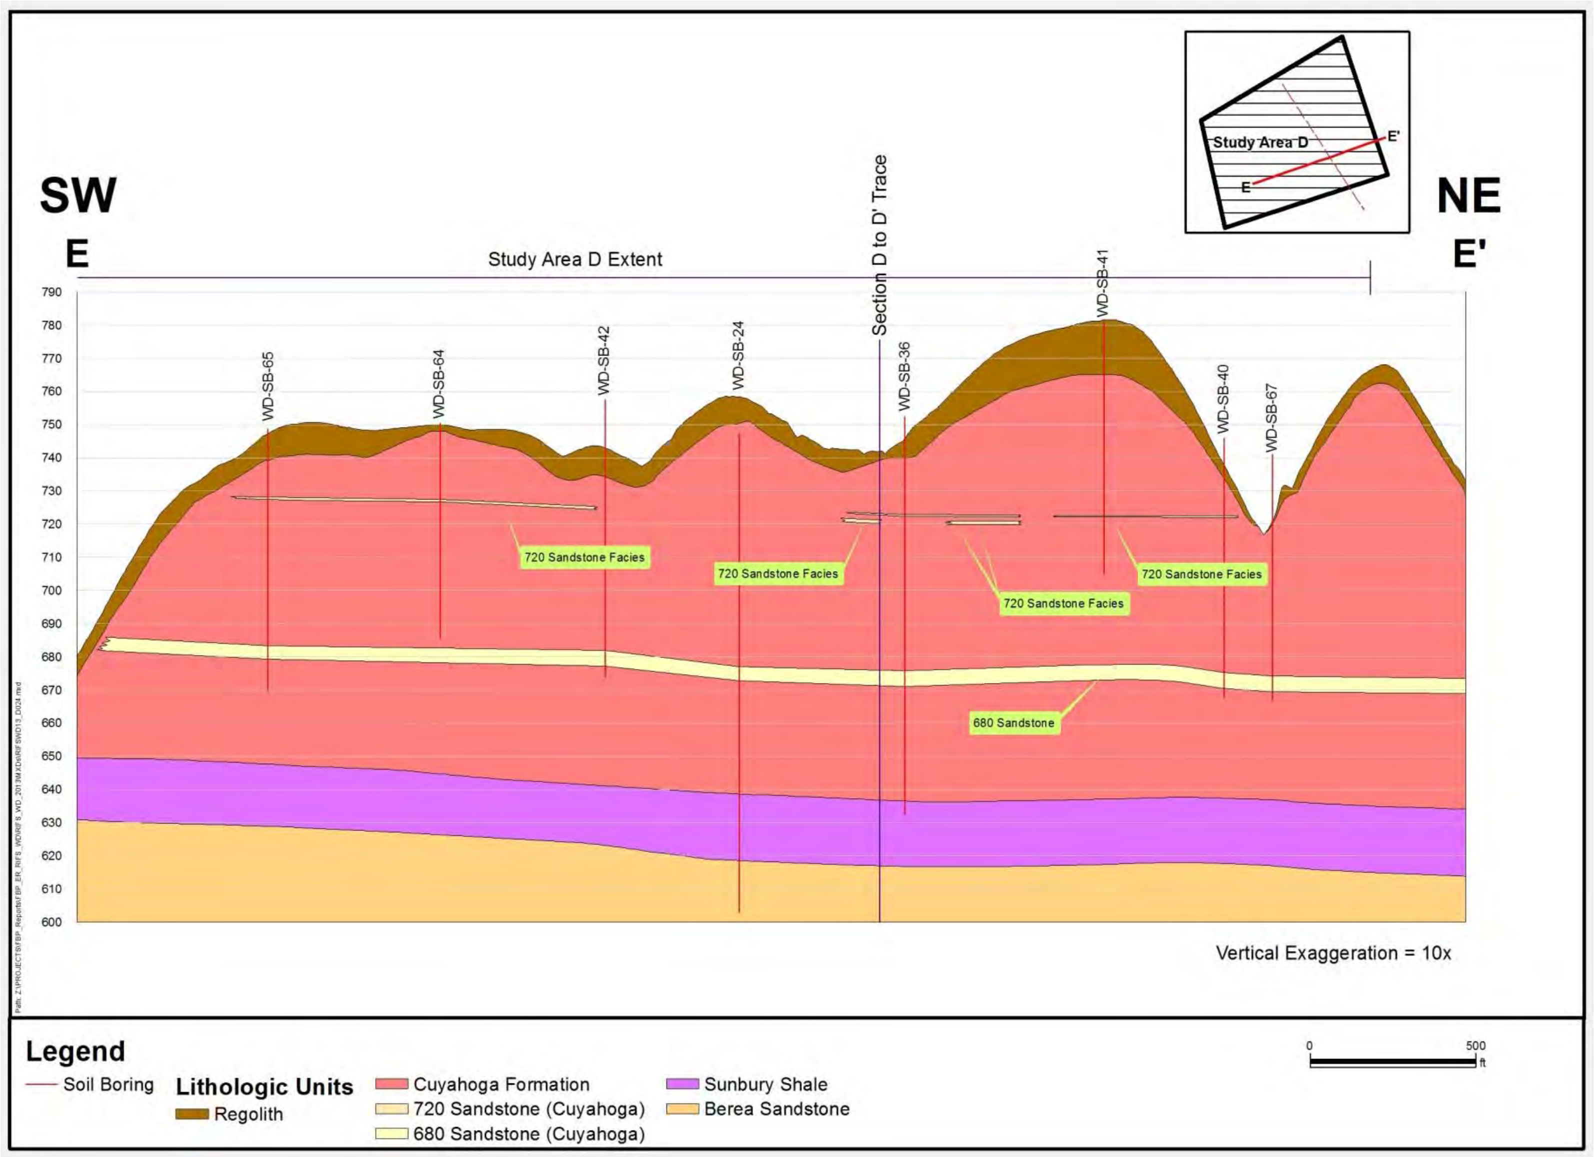

Figure D.25. Detailed Geologic Cross Section for Study Area D at PORTS

The Minford/Gallia are found only in the western and extreme northern portions of the study area and are absent in the upland areas (Figure D.19). Horizontal permeability tests on the Minford from the western portion of Study Area D ranged from 1.3×10^{-3} to 1.5×10^{-2} ft/day. Vertical permeability from the same samples ranged from 9.4×10^{-5} to 1.3×10^{-2} ft/day. Groundwater flow in the Gallia (Figure D.26) is essentially toward Little Beaver Creek and an unnamed tributary to Little Beaver Creek. This tributary lies west of the study area. The hydraulic gradient in the Gallia is low (ranging from less than 0.004 ft/ft to 0.015 ft/ft) with the steeper gradients existing closer to the discharge areas. Horizontal gradients measured in the Gallia during an 8 month period in 1994 averaged 0.0041 ft/ft (Martin Marietta Energy Systems, Inc. [MMES] 1994).

Natural recharge to the groundwater flow system comes mainly from precipitation, although land use and the presence of the bedrock shale units effectively reduce recharge to underlying units. Discharge of groundwater to the surface occurs primarily along streams that transect the plant. Natural recharge to the central portion of the plant is approximately 4 to 7 in./year whereas recharge in the uplands such as those at Study Area D (areas underlain by shale bedrock) is only 2 to 4 in./year (ODNR 2003). The recharge is less in the upland areas due to topography and low permeability of the bedrock and residual clayey soil. Water that infiltrates through the regolith likely moves laterally upon reaching the base of the deeply weathered zone due to the very low vertical permeability of the unweathered Cuyahoga Formation (1×10^{-3} to 1×10^{-6} ft/day).

Groundwater flow in the upland areas of Study Area D begins within the regolith. The movement of groundwater in the regolith is considered to be groundwater interflow and/or throughflow (i.e., subsurface stormflow). Groundwater interflow is the lateral movement of water in the soil zone, where a more permeable geologic unit (such as the regolith) overlies the less permeable bedrock. Most of the infiltrated water moves laterally and then discharges on hillsides as ephemeral seeps or directly into stream headwaters. If a disposal cell is constructed in this area, the regolith would be removed for installation of the bottom liner directly on top of competent bedrock.

In areas where stress-relief fractures occur in the bedrock, or the bedrock is sandy and more permeable, some of the groundwater in the regolith moves downward to provide recharge to the bedrock system. (In test pits, the more brittle sandstone layers were observed to have vertical fractures that did not extend into the overlying or underlying shale.) The Cuyahoga Formation contains several zones of thin sandstone layers.

The upper sandstone zone, recognized only at Study Area D, is referred to as the 720-ft sandstone lense zone. (This zone was first noted at an elevation of approximately 720 ft AMSL.) The thicknesses of the individually significant sandstone lenses in the 720-ft sandstone lense zone range from 0.3 to 1.5 ft with an average of 0.5 ft. A localized area of saturation is associated with the 720-ft sandstone lenses in the vicinity of WD-SB-40 and WD-PZ15C. The sandstone lenses receive recharge where they outcrop, or subcrop beneath the regolith (within the stream valley that WD-PZ15C is located within), or where fractures occur. The groundwater then moves laterally along the sandstone lense (or along bedding plane partings) and may re-emerge along the hillside in an ephemeral seep. None of the other open-hole piezometers had a groundwater elevation that coincided with the 720-ft sandstone zone. Hydraulic testing was conducted in two isolated zones in WD-PZ12C, which included the thin sandstone layers in the 720-ft sandstone lens zone, and neither zone could maintain a rate of 0.1 gpm. WD-PZ15C, which appears to have a water level consistent with an isolated zone of saturation in the 720-ft sandstone lens zone, had an estimated yield of 0.0007 gpm (over the entire borehole) and a conductivity of 0.001 ft/day.

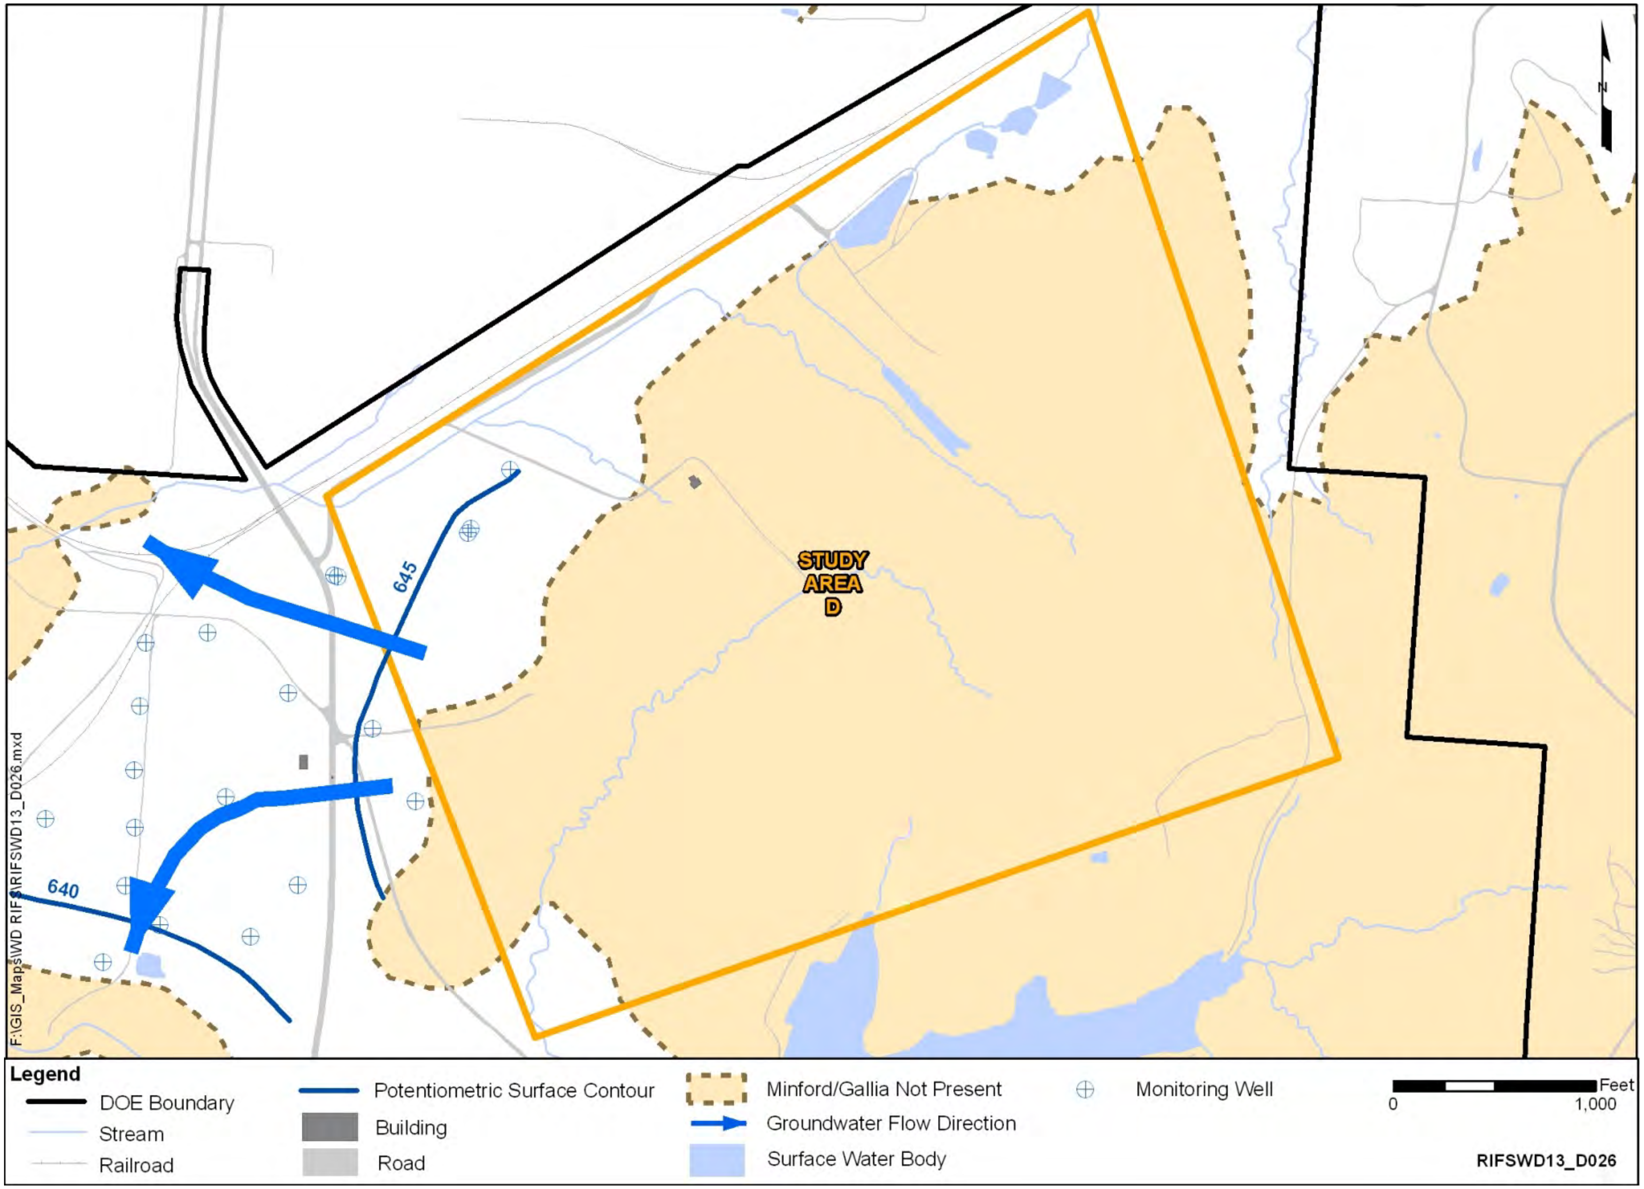

Figure D.26. Potentiometric Map of the Minford/Gallia in Study Area D at PORTS

The next recognizable zone in depth is the 680-ft sandstone zone, which was first noted at an elevation of 680 ft AMSL. This zone is comprised of an upper 2-ft-thick layer and a lower 0.4-ft-thick sandstone separated by approximately 2 ft of shale. Unlike the 720-ft sandstone zone, the individual sandstone layers in the 680-ft sandstone zone are continuous across Study Area D, except where removed by erosion to the west and north. They probably extend outside of the study area to the northeast and east, although the extent is limited by topography with the layer being eroded in the deeper valleys.

These sandstone zones in the Cuyahoga Formation are considered to be “significant zones of saturation” where they are in connection with fractures, including bedding plane partings, which facilitate groundwater flow. The vertical hydraulic conductivity of the 680-ft sandstone zone at Study Area D was determined in laboratory testing to be 0.0005 to 0.004 ft/day. The horizontal hydraulic conductivity is estimated to be 10 times that value. Eleven piezometers at Study Area D were geophysically logged to evaluate fracturing in the bedrock. The shallow weathered bedrock (to a depth of approximately 25 ft) did include some degree of fracturing. (Bedding plane partings were more recognizable in this zone.) Bedding plane fractures were noted at the top of the 680-ft sandstone in WD-PZ08C and WD-PZ13C, and a vertical fracture in the 680-ft sandstone was observed in WD-PZ09C and WD-PZ12C. These fractures in the 680-ft sandstone did not appear to extend into the shale above or below the sandstone. The shale in the Cuyahoga Formation had vertical hydraulic conductivities much lower than the sandstone (range from 0.000001 to 0.0009 ft/day), based on laboratory testing.

The water level data indicate the Cuyahoga Formation is saturated in some locations with a water table elevation varying between approximately 646 and 717 ft AMSL. The average depth to groundwater measured in the open-borehole Cuyahoga piezometers is approximately 50 ft below surface (ranges between 21 ft and 97 ft, depending on topography).

Figures D.27 and D.28 show possible groundwater flow directions for the 680-ft sandstone unit. (Figure D.27 shows current conditions, and Figure D.28 shows potential future conditions after the water level in X-611B is lowered.) A typical potentiometric map is not provided because the water level and yield data suggest there may be limited hydraulic connection across the entire area. For the future condition shown in Figure D.28, it is assumed the water level in X-611B is 660 ft AMSL or lower. Throughout the study period, the depth to the potentiometric surface as measured in the piezometers and monitoring wells was relatively consistent. The southern area near WD-PZ09C and WD-PZ12C appears to be influenced by interconnected fractures providing recharge, and bedding plane partings and fractures within the 680-ft sandstone (allowing greater transmissivity). During the wetter times of the year, recharge occurs where the 680-ft sandstone is closer to the surface, and stress-relief fractures provide a pathway for water in the regolith to recharge the upper bedrock. This is most evident near WD-PZ16C, which often has the highest water levels in the 680-ft sandstone. WD-PZ16C lies in a valley, and the sandstone subcrops beneath the regolith just below the surface. The hydraulic gradient in the center of the area is very small, and WD-PZ23C is slow to stabilize. Groundwater moves towards areas of lower hydraulic head along valleys where the sandstone outcrops and towards the east-southeast in a structurally down-dip direction.

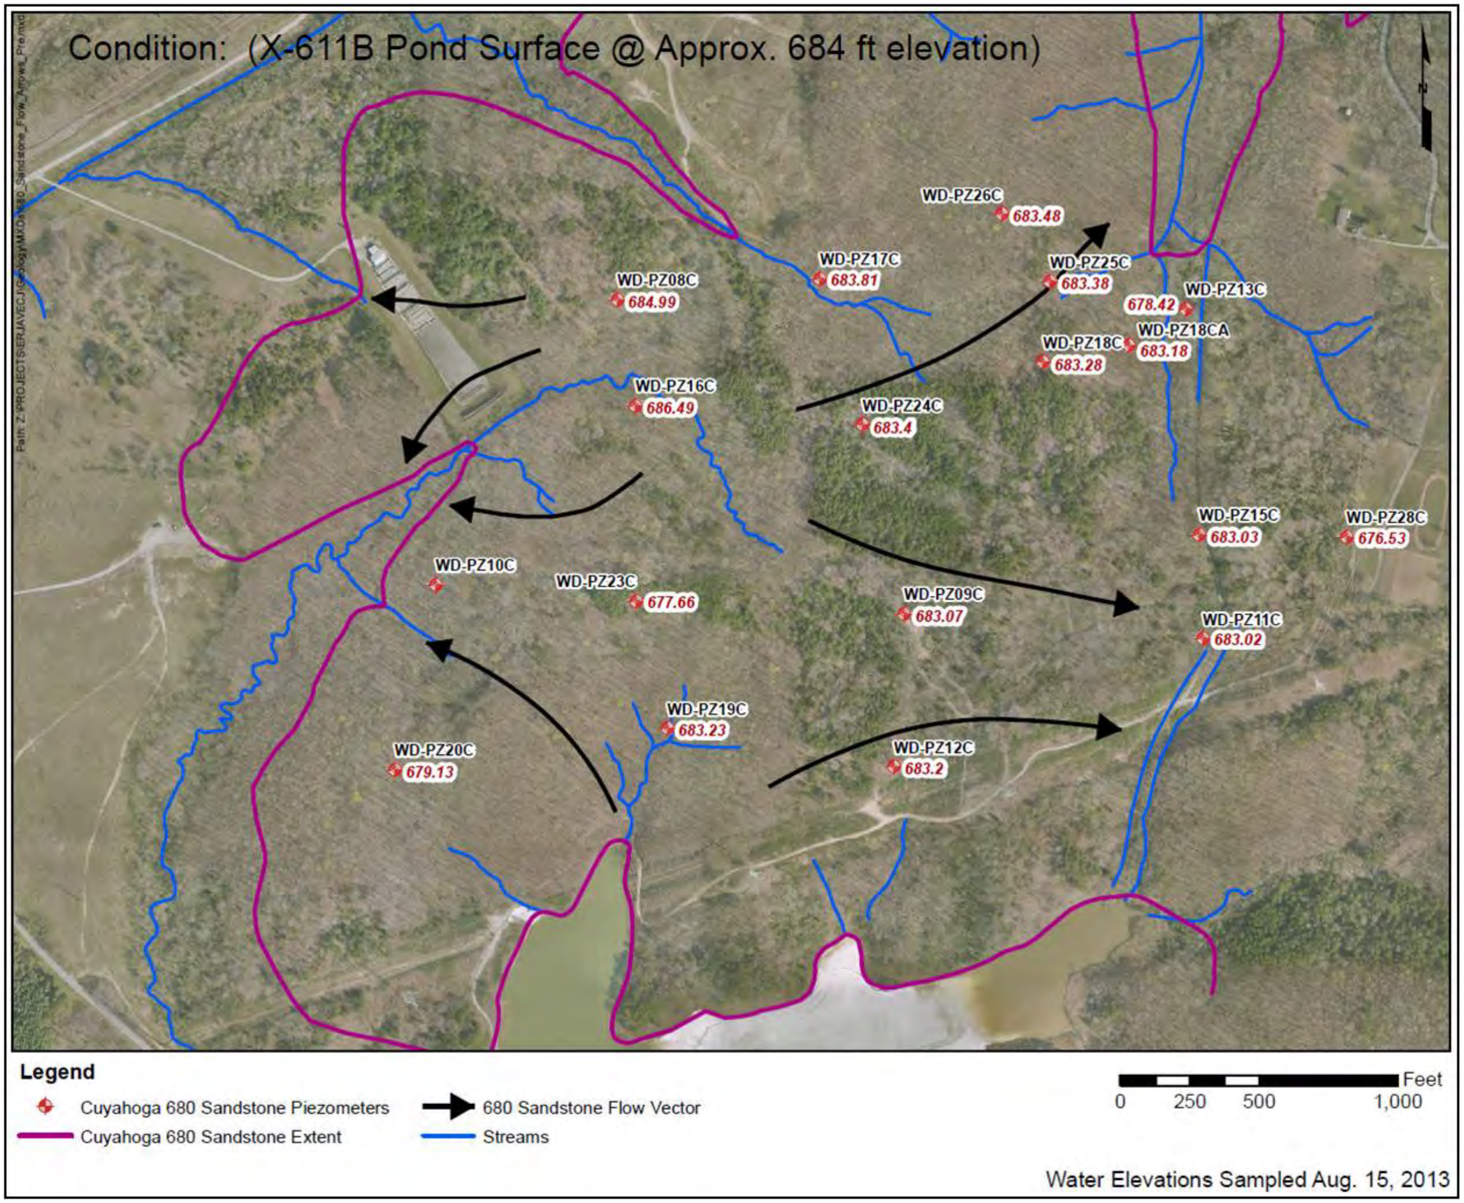

Figure D.27. Groundwater Flow in the 680-ft Sandstone Unit under Current Conditions

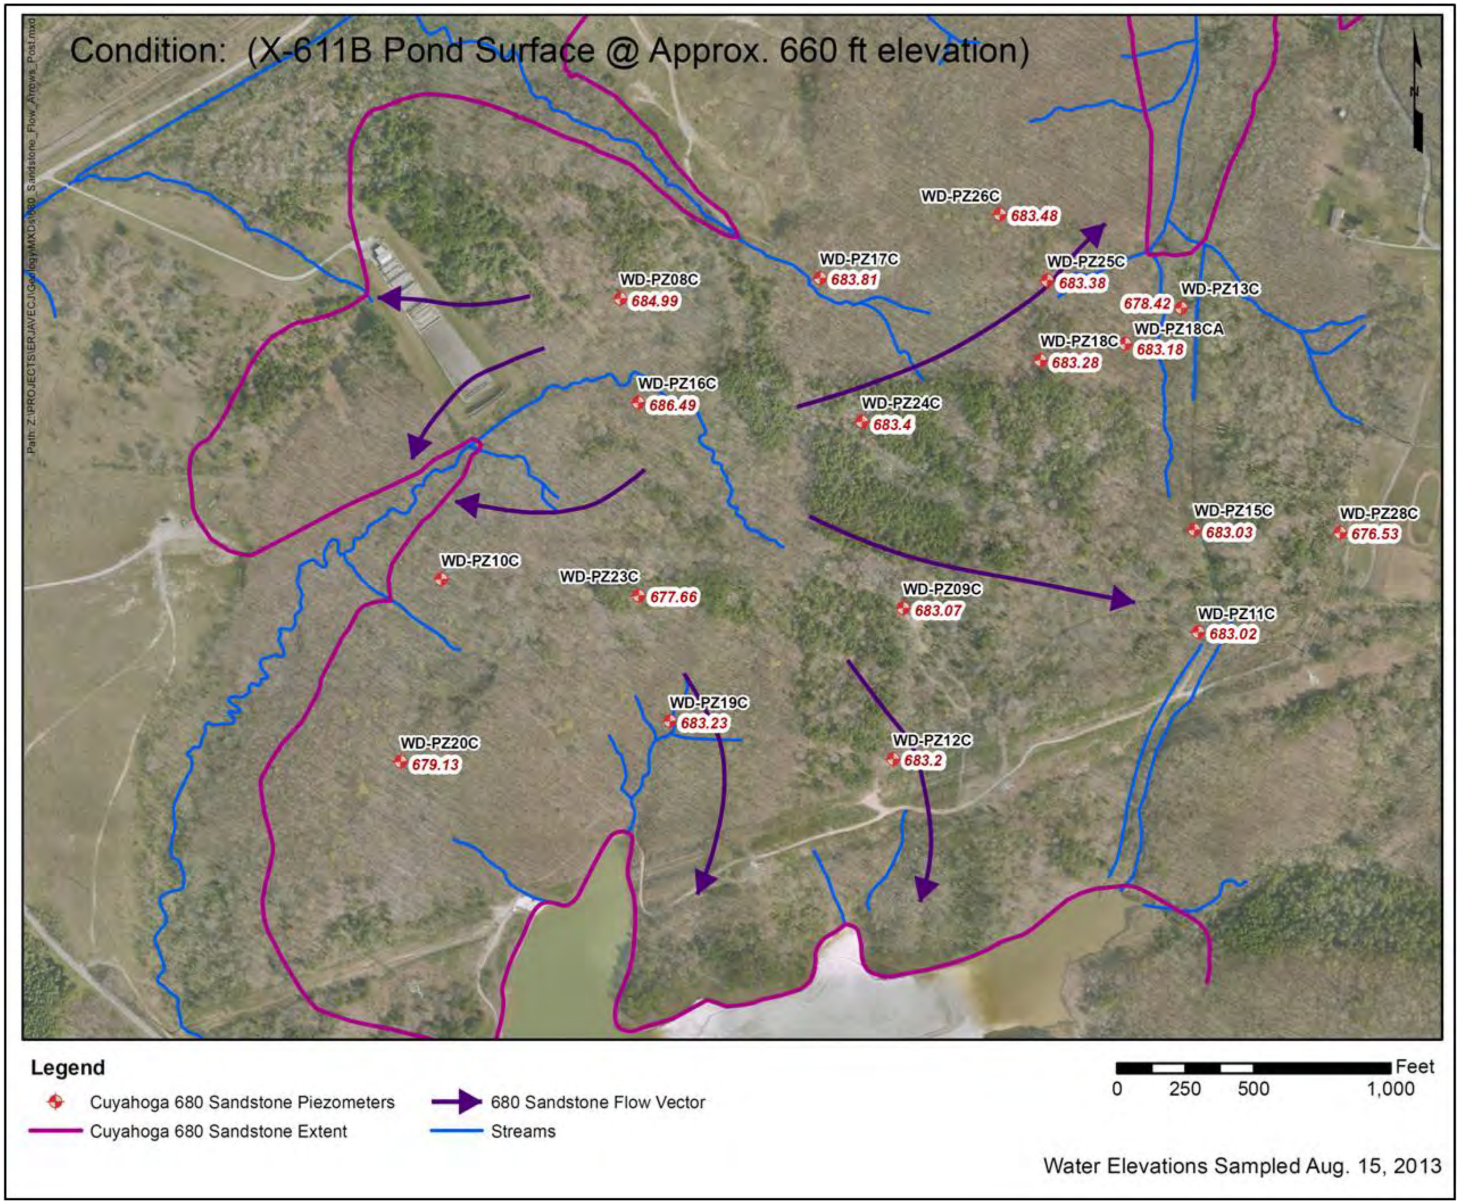

Figure D.28. Groundwater Flow in the 680-ft Sandstone Unit under Future Conditions

Hydraulic testing was performed in several of the Cuyahoga piezometers to determine yield and hydraulic conductivity of the 680-ft sandstone layer, and to investigate the connectivity of the saturated zones in the Cuyahoga Formation with the deeper Berea sandstone. Only two piezometers yielded greater than 0.1 gpm. WD-PZ09C and WD-PZ12C yielded 0.6 gpm and 1.2 gpm, respectively, while yields at WD-PZ11C, WD-PZ13C, WD-PZ14C, WD-PZ15C, WD-PZ16C, and WD-PZ17C were four orders of magnitude less (ranging from 0.0007 to 0.05 gpm) (Figure D.29). The average of all Cuyahoga piezometer yields was 0.16 gpm with a median yield of 0.002 gpm. The logarithmic mean, which may be more appropriate given the distribution, is less than 0.01 gpm. WD-PZ09C and WD-PZ12C also exhibited high barometric efficiency (approximately 90 percent), which suggests the tested zone is confined to a high degree. (Barometric efficiency is related to the magnitude of water level response due to changes in barometric pressure.) The hydraulic conductivity of the 680-ft sandstone layer, determined from preliminary evaluation of constant rate testing in WD-PZ09C and WD-PZ12C, was estimated to be in the range of 40 to 50 ft/day. This conductivity is higher than would be expected, based on literature values for fractured sandstone. The limited response to pumping observed in other, nearby piezometers would also suggest a lower hydraulic conductivity. Hydraulic conductivity in piezometers WD-PZ15C, WD-PZ16C, and WD-PZ17C was estimated to be much lower, ranging from 0.001 to 0.004 ft/day, but this may have been related to formation damage (skin effect) during drilling and poor piezometer development due to little water being produced from the formation. These piezometers also exhibited lower barometric efficiencies. In addition, testing indicated no hydraulic communication between the Cuyahoga Formation and the Berea sandstone. The 680-ft sandstone in the Cuyahoga Formation occurs approximately 55 to 60 ft above the Berea sandstone, which represents the uppermost aquifer system in this area.

The weathered/jointed zone in the Cuyahoga Formation at Study Area D also exhibited a shallow groundwater table lying above the unweathered shale at some locations (near WD-PZ12C in the southern portion of Study Area D, WD-PZ15C and SB-40 in the eastern portion of Study Area D, and WD-PZ14C on the northern side of the hill in Study Area D). These saturated zones appear to be more localized than the 680-ft sandstone layer. (The 720-ft zone appears to be locally saturated in the vicinity of WD-PZ15C and SB-40.)

The water level in WD-PZ12C, which is located near a small pond on the south side of Study Area D, was approximately 717 ft AMSL until the boring was extended to a depth just above the 680-ft sandstone. After being extended, the groundwater level stabilized at approximately 684 ft AMSL. The initial water level at an approximate elevation of 720 ft AMSL appears to be related to the thin, mostly discontinuous, sandstone layers in the upper Cuyahoga Formation. Any saturated conditions above the 680-ft sandstone layer appear to be very limited. Also, if a potential OSDC is constructed at Study Area D, much of the weathered bedrock, including much of the 720-ft sandstone facies, would be removed for installation of the bottom liner on top of competent bedrock.

At piezometer WD-PZ14C, on the northern side of the hill in Study Area D, the water level is at an elevation of approximately 670 ft AMSL. This elevation is below the occurrence of the 680-ft sandstone described above. The area appears to be a localized saturated zone, within the Cuyahoga shale, that is not continuous to the south in areas of higher topography, as observed in WD-PZ17C. A review of historical aerial photographs shows that WD-PZ14C is located within the area of a backfilled pond that was associated with the activities in a former borrow area. This piezometer has an open-borehole design with the surface casing set in the top of competent bedrock. The disturbed soil immediately overlying the bedrock likely has a higher storage capacity (due to higher porosity) and may allow higher infiltration rates, creating a localized saturated condition in the shallow bedrock.

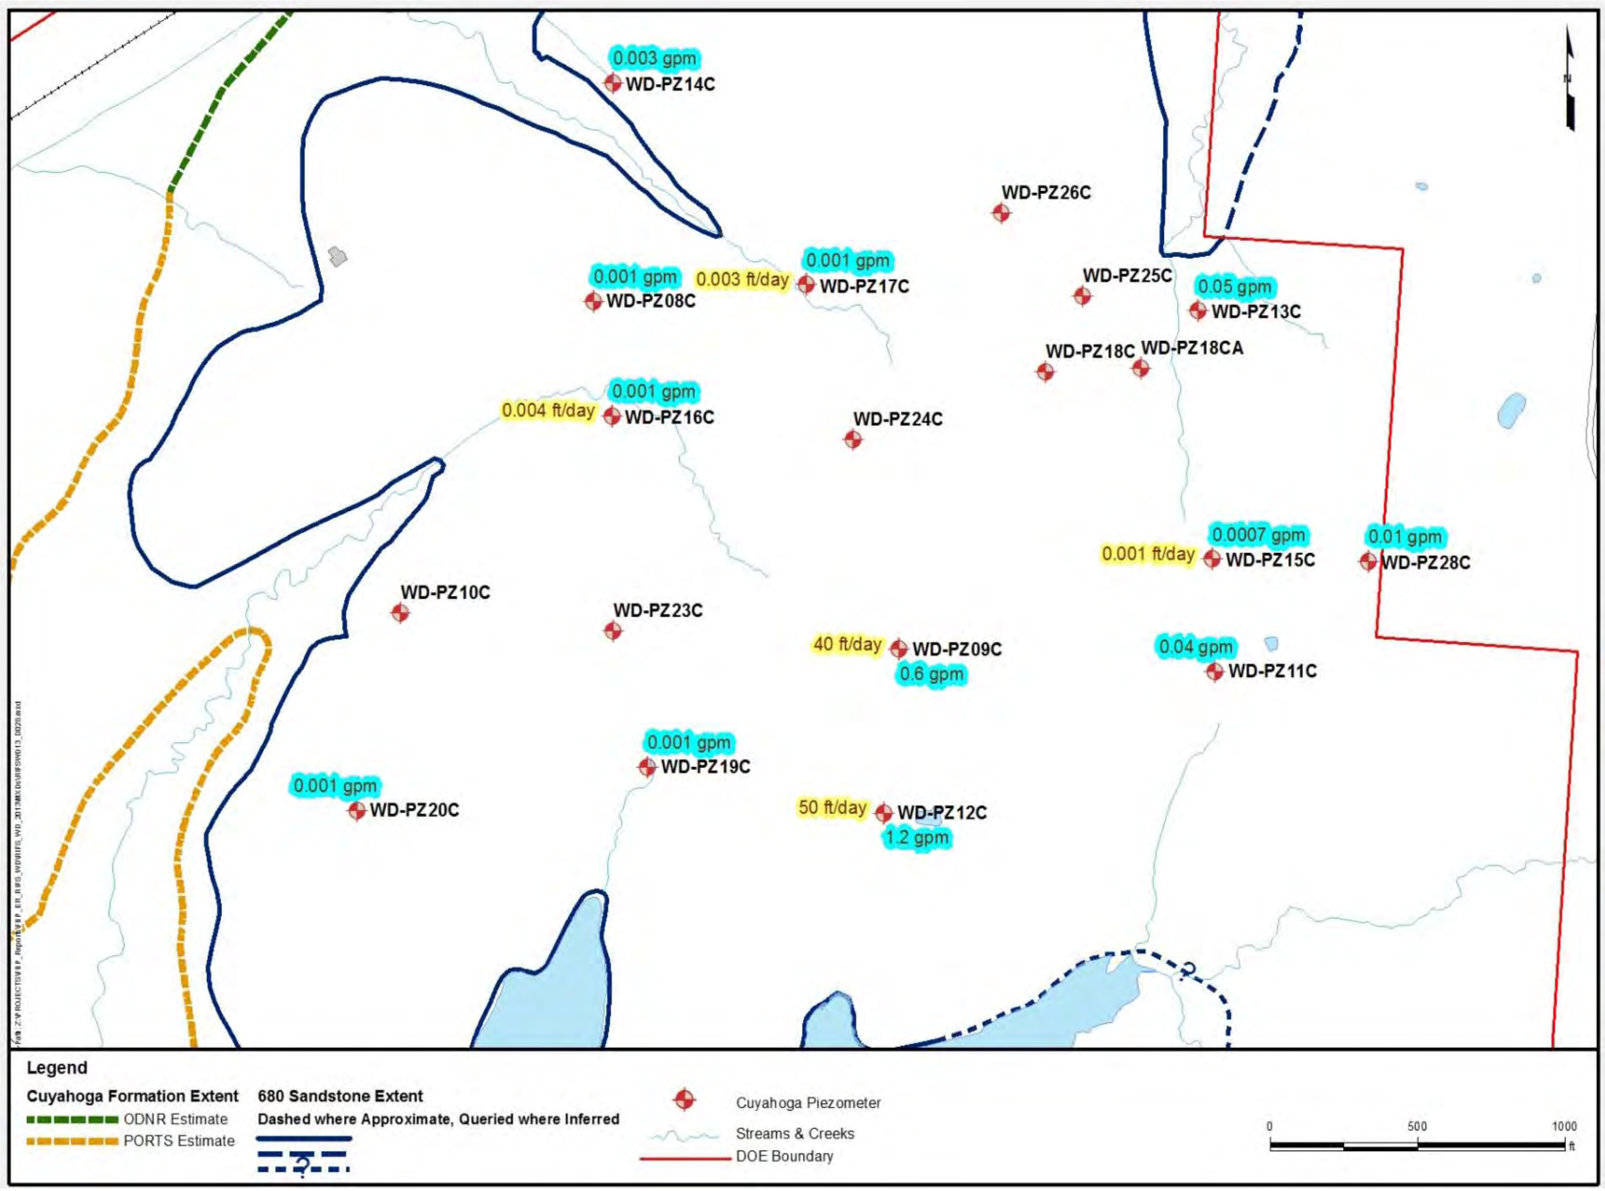

Figure D.29. Yield and Hydraulic Conductivity of Piezometers in the 680-ft Sandstone Unit

The Berea sandstone, occurring at an average elevation of approximately 619 ft AMSL in Study Area D, is considered to be the uppermost aquifer system in this area. The upper 10 to 15 ft of the Berea, which has a total thickness of approximately 35 ft, consists of a massive sandstone bed. The hydraulic conductivity determined by single-well aquifer tests of the Berea sandstone ranges from 4.5×10^{-3} to 15.0 ft/day with a mean value of 0.16 ft/day. The higher hydraulic conductivity tends to occur in areas where the Sunbury shale is absent and the Berea has been weathered. The Berea typically has yields greater than 1 gpm. Yield measurements are available for three wells (two residential wells and one PORTS Berea monitoring well) within a 1-mile radius around Study Area D. Based on these three wells, the average yield is 1.0 gpm. Table D.5 provides data on the residential wells within 1 mile of Study Area D, and these data are based on ODNR records. Low yields in the monitoring wells tested at Study Area D (logarithmic mean of 0.01 gpm) may be attributed to those wells having smaller diameters and shorter screened intervals (5 ft) when compared to a typical water supply well.

Table D.5. Residential Wells within 1 Mile of Study Area D (Based on ODNR Records)

ODNR Well	Surface Elev. (ft AMSL)	Total Depth (ft)	Casing Depth (ft)	Static Water Level (ft)	Yield (gpm)	Type of Well	Screened Formation	Description
112503	662	55	21	12	<1	Open Hole	Cuyahoga	Developed Yield at 50 gal/hour
124078	616	68	25	NM	NM	Open Hole	Berea	Sandstone
845220	860	170	28	50	1	Open Hole	Cuyahoga	Sandstone and shale, water at the sandstone/shale interface

Note: While the driller's log shows Well 112503 in shale, regional stratigraphic relationships suggest it is open to the Berea.

AMSL = above mean sea level
NM = not measured
ODNR = Ohio Department of Natural Resources

The horizontal permeability determined on tests of Berea sandstone cores ranges from 5.4×10^{-3} to 9.9×10^{-2} ft/day with a mean value of 2.0×10^{-2} ft/day. Vertical permeability was slightly less than horizontal permeability with a mean value of 1.0×10^{-2} ft/day (MMES 1994). Based on tests of Berea cores from the X-737 area, the horizontal conductivity varied from 1 to 2.5 times greater than the vertical conductivity. Porosity of the Berea, measured in the western portion of Study Area D, was approximately 15 to 20 percent. Yield testing in four Berea monitoring wells at Study Area D ranged from 0.008 gpm at WD-MW05B to 0.02 gpm at WD-MW06B with an average yield (and logarithmic mean) of 0.01 gpm.

In the far western portion of Study Area D, groundwater flow in the Berea is towards the south-southwest, also discharging to Little Beaver Creek, with a gradient varying from less than 0.002 to 0.004 ft/ft (Figure D.30). Horizontal gradients measured in the Berea in 1994 averaged 0.0025 ft/ft. Monitoring wells in the western portion of Study Area D showed no difference in water level elevation between the Gallia and Berea and suggest free groundwater exchange between the two units in this area (MMES 1994). Within the remaining portion of Study Area D, groundwater flow in the Berea is predominantly east-southeast with a horizontal hydraulic gradient of approximately 0.006 ft/ft.

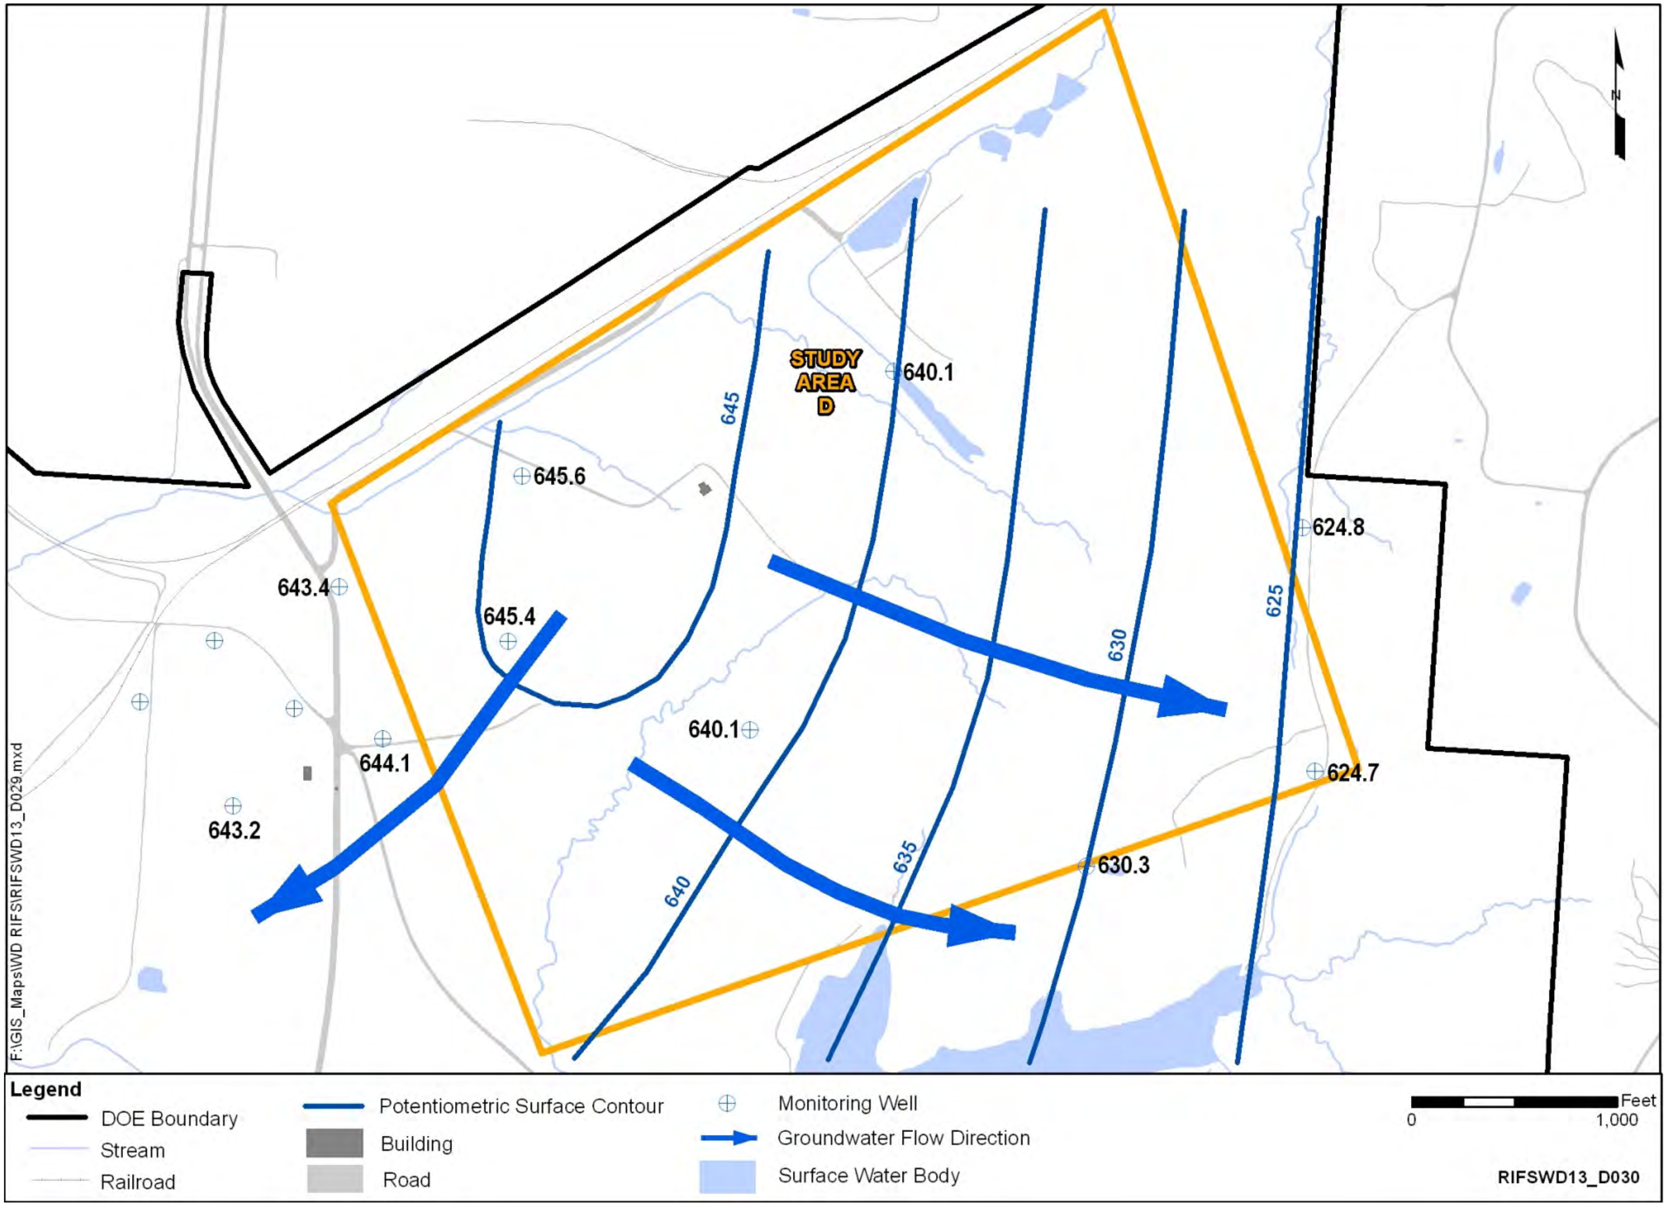

Figure D.30. Potentiometric Map of the Berea Sandstone in Study Area D at PORTS (Based on August 2012 Data)

Figure D.10 indicates that most of Study Area D, which is underlain by shale, has a relative pollution potential ranging from 95 to 103. This would be expected because the unconsolidated Gallia does not exist over the upland areas of Study Area D, and the permeability of the shale bedrock reduces the overall recharge in that area. The rate of groundwater flow, and potential contaminant migration, vertically through the Cuyahoga Formation and the Sunbury shale is expected to be very slow. Even where sandstone lenses occur within the Cuyahoga, they are thin (2 ft thick or less) and often not continuous over wide areas, with the exception of the 680-ft sandstone. The northern and western portions of the study area have a higher pollution potential where the Minford/Gallia exists.

Similar to Study Area C, Study Area D is underlain by thick shale that is composed mostly of clay minerals within the unsaturated zone. The retardation process for contaminants will be a very important process. The movement of a contaminant from a disposal facility at Study Area D is likely much slower in the unsaturated zone than at Study Areas A and B. While this area was not specifically modeled for the preliminary WAC developed in the work plan, the results would be similar to Study Area C due to the geologic characteristics of the location. Because of the thick shale present, Study Area D, similar to Study Area C, will provide greater protection to groundwater than Study Areas A and B.

Based on the soil survey of Pike County, four soil types occur within the Study Area D boundary (USDA 1990). The two most common soil series are present in the upland area that makes up most of the study area. The Rarden series consists of moderately deep, moderately well-drained, slowly permeable soils formed in acid, clayey shale residuum on ridgetops and hillsides. The Coolville series, nearer the tops of the ridges, consists of deep, moderately well-drained soils formed in a thin silty mantle weathered from acid shale that has thin strata of siltstone.

Another soil type present within Study Area D is Omulga silt loam in the northwestern portion of the study area. The surface layer of Omulga silt loam is dark grayish-brown, friable, and approximately 10 in. thick. The subsoil is approximately 54 in. thick and is composed of three portions: (1) a yellow-brown, friable silt loam; (2) a fragipan (brittle, compacted subsurface soil) of yellow-brown, mottled, firm, and brittle silty clay loam; and (3) a yellow-brown, mottled, friable silt loam approximately 20 in. thick.

The fourth soil type found in Study Area D is the Latham-Wharton silt loam. The Latham and Wharton series are characterized as moderately deep, slowly permeable soils formed in colluviums and residuum derived from acid shale with thin layers of siltstone and fine-grained sandstone. In Study Area D, the Latham-Wharton silt loam is found along the intermittent drainages formed on hillsides.

D.5.2 SURFACE WATER RESOURCES

There are no perennial streams within Study Area D. The area lies mostly within the drainage area of Little Beaver Creek, which drains the eastern and northern portions of PORTS before discharging into Big Beaver Creek.

The western portion of Study Area D is drained by an approximately 0.8-mile-long, unnamed, intermittent/ephemeral tributary to Little Beaver Creek. Portions of this stream have been tentatively classified as a Class IIIA Primary Headwater Habitat (PHWH) stream. Class III PHWH streams are defined as perennial streams with moderately to highly diverse biologic communities (Ohio EPA 2012a). On April 9-10, 2012, a Level 1 Assessment of the physical habitat and geomorphic characteristics of several streams in Study Area D was performed by DOE. A total of eight PHWH stream systems were identified with a total of 22 individual streams present within Study Area D. The stream discussed above, south and southwest of the X-114A New Firing Range, was classified as a probable Class III PHWH in a 1,672 ft reach downstream of the firing range. Approximately 1,250 ft of the same stream was preliminarily identified as a Class II interstitial PHWH stream system. A Level 2 Assessment was performed in 2013 to support the final determination of stream classification. Other than the presence of the two-lined salamander, physical and biological data for the streams classified as Class IIIA would have indicated a Class II designation. No streams in Study Area D were assigned a provisional Class IIIB PHWH classification, which would indicate high quality, coldwater habitat conditions. Section 2 of the RI/FS report contains more detail on the stream study in Study Area D.

A small portion of Study Area D along the eastern boundary drains to an unnamed tributary to Big Beaver Creek. This unnamed tributary joins Big Beaver Creek approximately 750 ft downstream from the DOE property boundary.

Little Beaver Creek is a small, high-gradient, unmodified stream that receives the majority of its flow from the X-230J7 East Holding Pond discharge through the East Drainage Ditch. Little Beaver Creek also receives effluent via the Northeast Drainage Ditch through the outfall from the X-230J6 Northeast Holding Pond and via the North Drainage Ditch through the outfall from the X-230L North Holding Pond. Substrates are predominantly slab boulders and bedrock at the upper reach to gravel and sand near the mouth of the stream. During parts of the year, intermittent flow conditions exist upstream from the X-230J7 discharge. During the summer/fall low-flow time of the year, the upstream section is composed of shallow, isolated pools with intermittent flow (Ohio EPA 2006).

Several seeps have been observed in Study Area D. These seeps appear to be ephemeral in nature and primarily occur as interflow and/or throughflow (i.e., subsurface stormflow) following precipitation events. Water infiltrates laterally into the regolith for a relatively short distance and discharges on hillsides as ephemeral seeps (throughflow returning as wet weather conveyances) or directly into streams (interflow). Based on the variability of the seep elevations, most of the seeps do not appear to be associated with any particular sandstone lenses or layers, but they are generally found at the interface above the weathered bedrock surface. In some instances, groundwater may discharge from either sandstone lenses or bedding plane partings in the weathered bedrock to create seeps along the hillside. Of the 56 seeps identified to date, fewer than 10 appear to be related to specific sandstone layers (either the 720-ft sandstone lenses or the 680-ft sandstone layer). Section 2.2.2.3 of the RI/FS report provides additional information on the investigation of these seeps. If a potential disposal cell were to be constructed in this area, it is important to note that the regolith (and this interflow zone) would be removed for installation of the bottom liner directly on top of competent bedrock.

D.5.3 ECOLOGICAL RESOURCES

Study Area D is primarily forest with two large areas of grassland. Man-made features are sparse in this study area, consisting only of the X-114A New Firing Range (near the center), its access road, and two unimproved roads.

Six jurisdictional wetlands (Q4-17, Q4-19, Q4-20, Q4-46, Q4-47, and Q4-48) are located partially or entirely within Study Area D. The wetlands in Study Area D, identified in a previous study, are described in Table D.6 (LMES 1996).

Table D.6. Wetlands in Study Area D

Wetland Number	Status	Acreage	Location	Comments
Q4-15	Nonjurisdictional	0.114	X-611B	Sludge lagoon
Q4-17	Jurisdictional	0.229	Fog Road	Natural area; past disturbance
Q4-19	Jurisdictional	0.447	North Borrow Area	Part drainage ditch
Q4-20	Jurisdictional	0.389	North Borrow Area	Drainage ditch
Q4-46	Jurisdictional	0.040	North Borrow Area	Borrow area
Q4-47	Jurisdictional	0.499	North Borrow Area	Drainage ditch
Q4-48	Jurisdictional	0.564	North Borrow Area	Drainage ditch; beaver activity

Source: LMES 1996

LMES = Lockheed Martin Energy Systems, Inc.

An updated wetland evaluation of Study Area D was conducted in 2013; Section 2 of this RI/FS report provides more details on this study. Of the 24 wetlands identified in this study, 10 were designated as Category 1 (0.285 total acres), eight were designated as Category 2 (3.369 total acres), and six were designated as a Modified Category 2 (0.549 total acres). No high-quality Category 3 wetlands were identified in Study Area D. There is relatively good correlation to the jurisdictional wetlands identified in the 1996 study, but generally, those wetlands are now smaller (Stantec Consulting Services [Stantec] 2013).

No endangered species habitat areas or endangered plant species are present in Study Area D; there are no endangered or threatened fish species or exceptional warmwater streams within the boundaries of Study Area D. Ohio University is conducting a detailed habitat mapping study that will be completed in early 2013. Preliminary findings from this study, using updated guidelines, are that Indiana bat habitat may be more extensive than indicated in prior studies. The primary trees that produce exfoliating bark and nesting cavities (e.g., sycamore and shagbark hickory) are abundant in the older forest habitats, including forest habitats in Study Area D (Ohio University 2012). Figure D.31 shows the results of the preliminary habitat mapping in Study Area D.

D.5.4 CULTURAL RESOURCES

Three of the 36 archaeological sites identified during the 1996-1997 Phase I archaeological survey are located within Study Area D. In the January-February 2012 Phase I archaeological survey in Survey Areas 1 and 2, which encompassed all of Study Area D, 15 additional archaeological sites were identified (Mustain 2013). Seven of these sites are located entirely within Study Area D with one located partially within Study Area D.

One site appears to be located immediately outside the east boundary of Study Area D, but the formal boundaries of Study Area D have not been precisely determined on the ground by a civil land survey. Therefore, a future land survey could determine that a portion of that site actually lies within Study Area D. This site appears to have a substantial historic component and a minor prehistoric component represented by a single isolated find of one chert artifact.

Three sites had potential historic properties and additional Phase II archaeological testing was conducted to further evaluate their eligibility for listing on the NRHP. Two of the sites are recommended as eligible for listing on the NRHP.

The only architectural resource identified in Study Area D is the X-114A New Firing Range, which is located near its center.

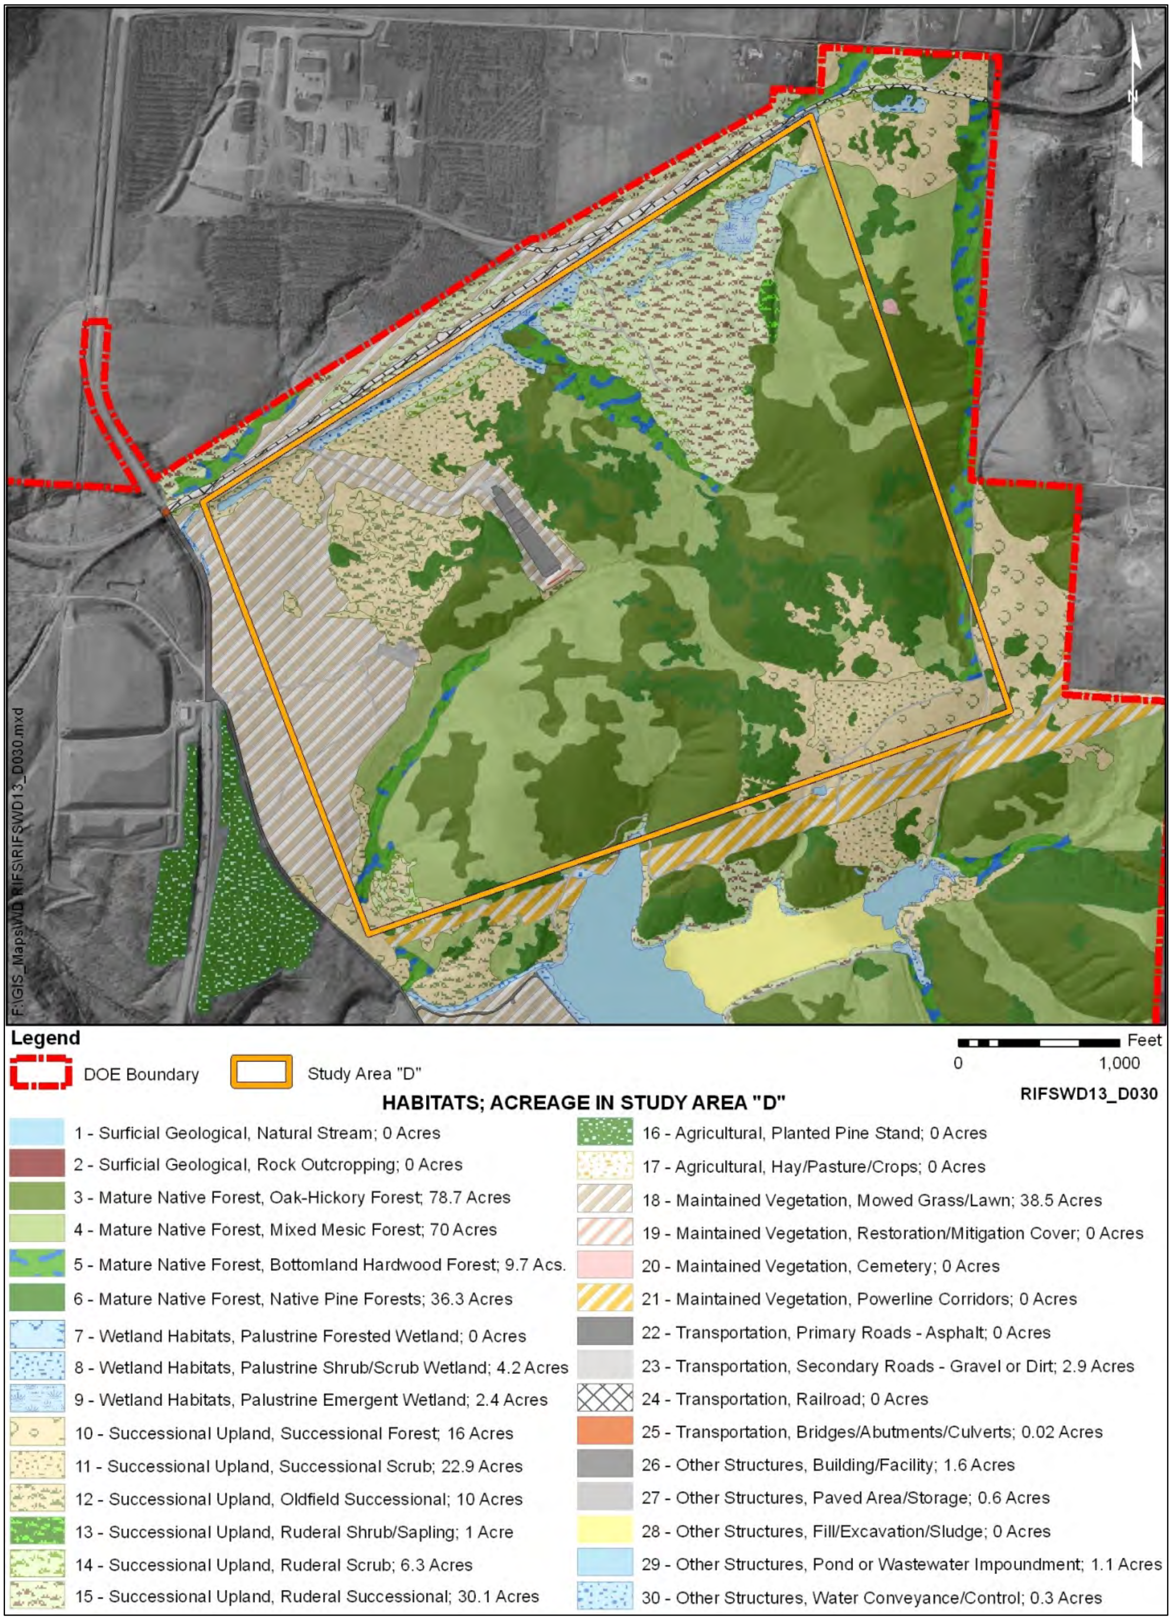

Figure D.31. Preliminary Habitats for Study Area D

D.6 LOCATION SELECTION

This section presents a summary of the siting requirements and provides an evaluation of the four study areas to determine which study area will be the representative location for evaluation in the RI/FS. The areas first undergo a screening to identify those areas considered preferable for further evaluation. Areas that do not pass this screen are dropped from further consideration in the RI/FS or design process.

The remaining areas are then evaluated further to determine which area will be considered for development of a potential OSDC. The final selection criteria were derived from the *April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) (Ohio EPA 2012b) requirements (protective of human health and the environment and compliance with applicable or relevant and appropriate requirements [ARARs]) and other important constructability and operational factors, as well as stakeholder input. For construction/operational objectives, it is important that the selected study area be available to meet the overall PORTS D&D schedule, that it accommodates a reasonable construction schedule, that it be sufficiently distant from the DOE boundary to provide an adequate buffer zone, that it minimizes site preparation activities, that it is near the D&D activities to minimize hauling efforts, and that it can accommodate a large enough cell to meet projected future disposal needs.

D.6.1 SITING REQUIREMENTS

The ARARs and to-be-considered (TBCs) identified in Appendix F address siting, design, construction, operation, capping, and post-operations care for a potential OSDC. These ARARs and TBCs include landfill siting requirements under Toxic Substances Control Act of 1976 (TSCA), Subtitle C of RCRA (federal and analogous state regulations), and DOE Order 435.1-1, as well as certain State of Ohio regulations (*OAC* 3745-27) deemed applicable or relevant and appropriate by the DFF&O parties for siting solid waste disposal facilities. Appendix F also includes location-specific ARARs and TBCs that include siting considerations to protect sensitive resources (such as wetlands, floodplains, critical habitats, streams).

The siting requirements and considerations can be grouped generally as floodplains, wetlands, seismic considerations, hydrologic considerations, suitable terrain, land use, buffers, and ecological and cultural considerations.

TSCA. The TSCA chemical waste landfill design requirements in 40 *CFR* 761.75 generally follow the RCRA hazardous waste landfill design requirements but TSCA also specifies that the bottom of the landfill liner system must be located 50 ft above the historical high groundwater mark and that there must be no hydrologic connection between the disposal facility and any surface water (40 *CFR* 761.75[b][3]). If the on-Site waste disposal alternative is selected, a waiver of the TSCA requirement that the bottom of a landfill liner be 50 ft above the historical high groundwater table may need to be sought, depending on the candidate location that is chosen, or disposal of TSCA waste would be forbidden in the area of the cell that cannot meet this requirement.

RCRA. The federal and State of Ohio regulations for siting RCRA Subtitle C hazardous waste disposal landfills include floodplain and seismic considerations, as well as siting restrictions. Hazardous waste disposal facilities must not be located within 200 ft of a fault that had displacement in Holocene time and must not be located within the boundaries of a state park or state park purchase area or national park or recreation area or national park candidate area. The RCRA regulations don't forbid locating a facility in a 100-year floodplain, but do require that such a facility be designed, constructed, operated, and maintained to prevent washout of any hazardous waste by a 100-year flood.

Ohio solid waste regulations. Ohio's rules (*OAC* 3745-27) for siting solid waste disposal facilities identify five location restriction demonstrations: airport safety, regulatory floodplain, Holocene fault, seismic impact zone and unstable area. A landfill cannot be located within a "regulatory floodplain," in a "seismic impact zone," or in an "unstable area" as these terms are defined in *OAC* 3745-27-01. A landfill cannot be located within 200 ft of a Holocene fault, within 10,000 ft of any airport runway end used by turbojet aircraft, or within 5,000 ft of any airport runway end used by only piston-type aircraft. Ohio does not identify wetlands as a location restriction demonstration, but does address the federal requirements as a prohibition from the construction of new units in a location until the Clean Water Act requirements are satisfied for that location. Floodplain, fault area, seismic impact zone, and unstable area restrictions address conditions that may have adverse effects on landfill performance that could lead to releases to the environment or disruptions of natural functions (for example floodplain flow restrictions). Airport safety, floodplain, and wetlands criteria are intended to restrict landfill units in areas where sensitive natural environments and/or the public may be adversely affected.

New solid waste landfills also cannot be in a national park or recreational area, sand or gravel pit, or limestone or sandstone quarry. New solid waste landfills cannot be within 1,000 ft of a national or state nature/wildlife preserve, national or state scenic river, special interest or research area, or stream area designated by Ohio EPA as a cold or warmwater habitat. Solid waste cannot be placed within 300 ft of a landfill's property line, within 1,000 ft of a residence, or within 200 ft of a stream, lake or natural wetland. A solid waste landfill cannot be located above a sole source aquifer (a sole source aquifer is federally designated as an area's primary source of water), in areas surrounding a public water supply well, or above an unconsolidated source of water, like sand or gravel beds, that are capable of supplying 100 gpm of water to a well that is within 1,000 ft of where solid waste is placed. Table D.7 provides a preliminary screening of the four study areas against the applicable siting ARARs from *OAC* 3745-27. Figures D.32 and D.33 show the proximity of the potential waste boundaries to many of these items.

Low-level radioactive waste. DOE Order 435.1-1 does not set specific siting restrictions for low-level radioactive waste disposal facilities but does require that potential locations be evaluated considering environmental characteristics, geotechnical characteristics, and human activities, including whether it is located in a floodplain, a tectonically active area, or in a zone of water table fluctuation. The Order also requires that potential locations with environmental and geotechnical characteristics, and human activities for which adequate protection cannot be provided through the facility design be deemed unsuitable for the location of the facility.

Additional location-specific restrictions. Certain location-specific ARARs included in Appendix F also restrict waste disposal activities that would have an impact on sensitive local resources such as wetlands or aquatic resources, state- or federal-listed threatened or endangered species or their habitat, or archeological or cultural artifacts or historic sites or Native American remains. A combination of state and federal regulations regulate such activities in order to minimize adverse impacts and provide for mitigation of unavoidable impacts.

Table D.7. Applicable Siting ARARs from *OAC* 3745-27

Requirement	**Study Area A**	**Study Area B**	**Study Area C**	**Study Area D**
The limits of solid waste placement of the landfill cannot be:				
Within 1,000 ft of or within a national park or recreation area or candidate area for potential inclusion in the national park system; or a state park or state park purchase area; or any property that lies within the boundaries of a national park or recreation area but that has not been acquired or is not administered by the secretary of the DOI (1,000-ft setback does not apply if obtain written authorization from the owner to locate within 1,000 ft);	✓	✓	✓	✓
In a sand or gravel pit;	✓	✓	✓	✓
In a limestone or sandstone quarry;	✓	✓	✓	✓
Above a federally designated sole source aquifer, unless granted an exemption by Ohio EPA;	✓	✓	✓	✓
Above an unconsolidated aquifer system capable of sustaining a yield of 100 gpm for a 24-hour period to a well located within 1,000 ft of where solid waste is placed, unless deemed acceptable by Ohio EPA.	**Note *a***	**Note *a***	✓	✓
The isolation distance between the uppermost aquifer system and the bottom of the recompacted soil liner of the landfill must be not less than 15 ft of in situ or added geologic material deemed acceptable by Ohio EPA.	✗	✗	✓	✓
The limits of solid waste placement of the landfill and any leachate ponds or lagoons cannot be located within the surface and subsurface areas of the following:				
Surrounding a public water supply well through which contaminants may move toward and may reach the well through underground geologic or man-made pathways within a period of 5 years;	✓	✓	✓	✓
A wellhead protection area or a drinking water source protection area for a public water system using groundwater.	✓	✓	✓	✓
Landfill cannot be located within an area of potential subsidence due to an underground mine or within the angle of draw of an underground mine unless the potential impact to the facility due to subsidence is minimized.	✓	✓	✓	✓
The limits of solid waste placement of the landfill cannot be within 1,000 ft of a water supply well or a developed spring unless one or more of the conditions listed in *OAC* 3745-27-07(H)(3)(c)(i) – (iv) is met.	✓	✓	✓	✓
Solid waste cannot be placed within 1,000 ft of the following natural areas:				
National or state nature/wildlife refuge or preserve;	✓	✓	✓	✓
National or state wild, scenic, or recreational river;	✓	✓	✓	✓
Special interest or research area; or	✓	✓	✓	✓
Stream area designated by Ohio EPA as a coldwater or exceptional warmwater habitat. (**Note *b***)	✓	✗	✓	✓

Table D.7. Applicable Siting ARARs from *OAC* 3745-27 (Continued)

Requirement	**Study Area A**	**Study Area B**	**Study Area C**	**Study Area D**
Solid waste cannot be placed:				
Within 300 ft of the landfill facility's property line, unless deemed acceptable by Ohio EPA;	✓	✓	✓	✓
Within 1,000 ft of a residence whose owner has not consented in writing to its location;	✓	✓	✗	✓
Within 200 ft of a stream;	✓	**Note *c***	✓	**Note *c***
Within 200 ft of a lake;	✓	✓	✓	✓
Within 200 ft of a wetland;	✓	✗	✓	✓
In a regulatory floodplain (as defined in *OAC* 3745-27-01) unless demonstrated that unit(s) will not restrict flow of the 100-yr flood, reduce the temporary water storage capacity of the floodplain, or result in washout of solid waste so as to pose a hazard to human health and the environment;	✓	✓	✓	✓
Within 200 ft of a fault that has had displacement in Holocene time unless it is demonstrated that a distance of less than 200 ft will prevent damage to the structural integrity of the facility and will be protective of human health and the environment;	✓	✓	✓	✓
In a "seismic impact zone" (as defined in *OAC* 3745-27-01) unless demonstrated that all containment structures, including liners, leachate collection systems, sedimentation ponds, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth material for the location;	✓	✓	✓	✓
In an "unstable area" (as defined in *OAC* 3745-27-01) unless demonstrated that engineering measures have been incorporated into the design of the facility to ensure that the integrity of the structural components will not be disrupted.	✓	✓	✓	✓

Note *a* – Both Study Areas A and B overlie an unconsolidated aquifer system; however, this aquifer is not capable of a sustained yield of 100 gpm for a 24-hour period.

Note *b* – Little Beaver Creek is formally classified pursuant to *OAC* 3745-1-09 (Table 9-1) as, among other uses, Warmwater Habitat. However, Ohio EPA's *Biological and Water Quality Study of Portsmouth Gaseous Diffusion Plant Streams* (2006) states that Little Beaver Creek meets criteria for warmwater habitat, and portions may attain "exceptional warmwater habitat" criteria. Only Study Area B lies within 1,000 ft of Little Beaver Creek.

Note *c* - Both Study Areas B and D include ephemeral to intermittent streams, which may be within 200 ft of the planned limits of waste. Portions of the intermittent streams in Study Area D have been identified as meeting the criteria for a Class IIIA Primary Headwater Habitat.

Figure D.32. Siting Considerations for Study Areas A and C at PORTS

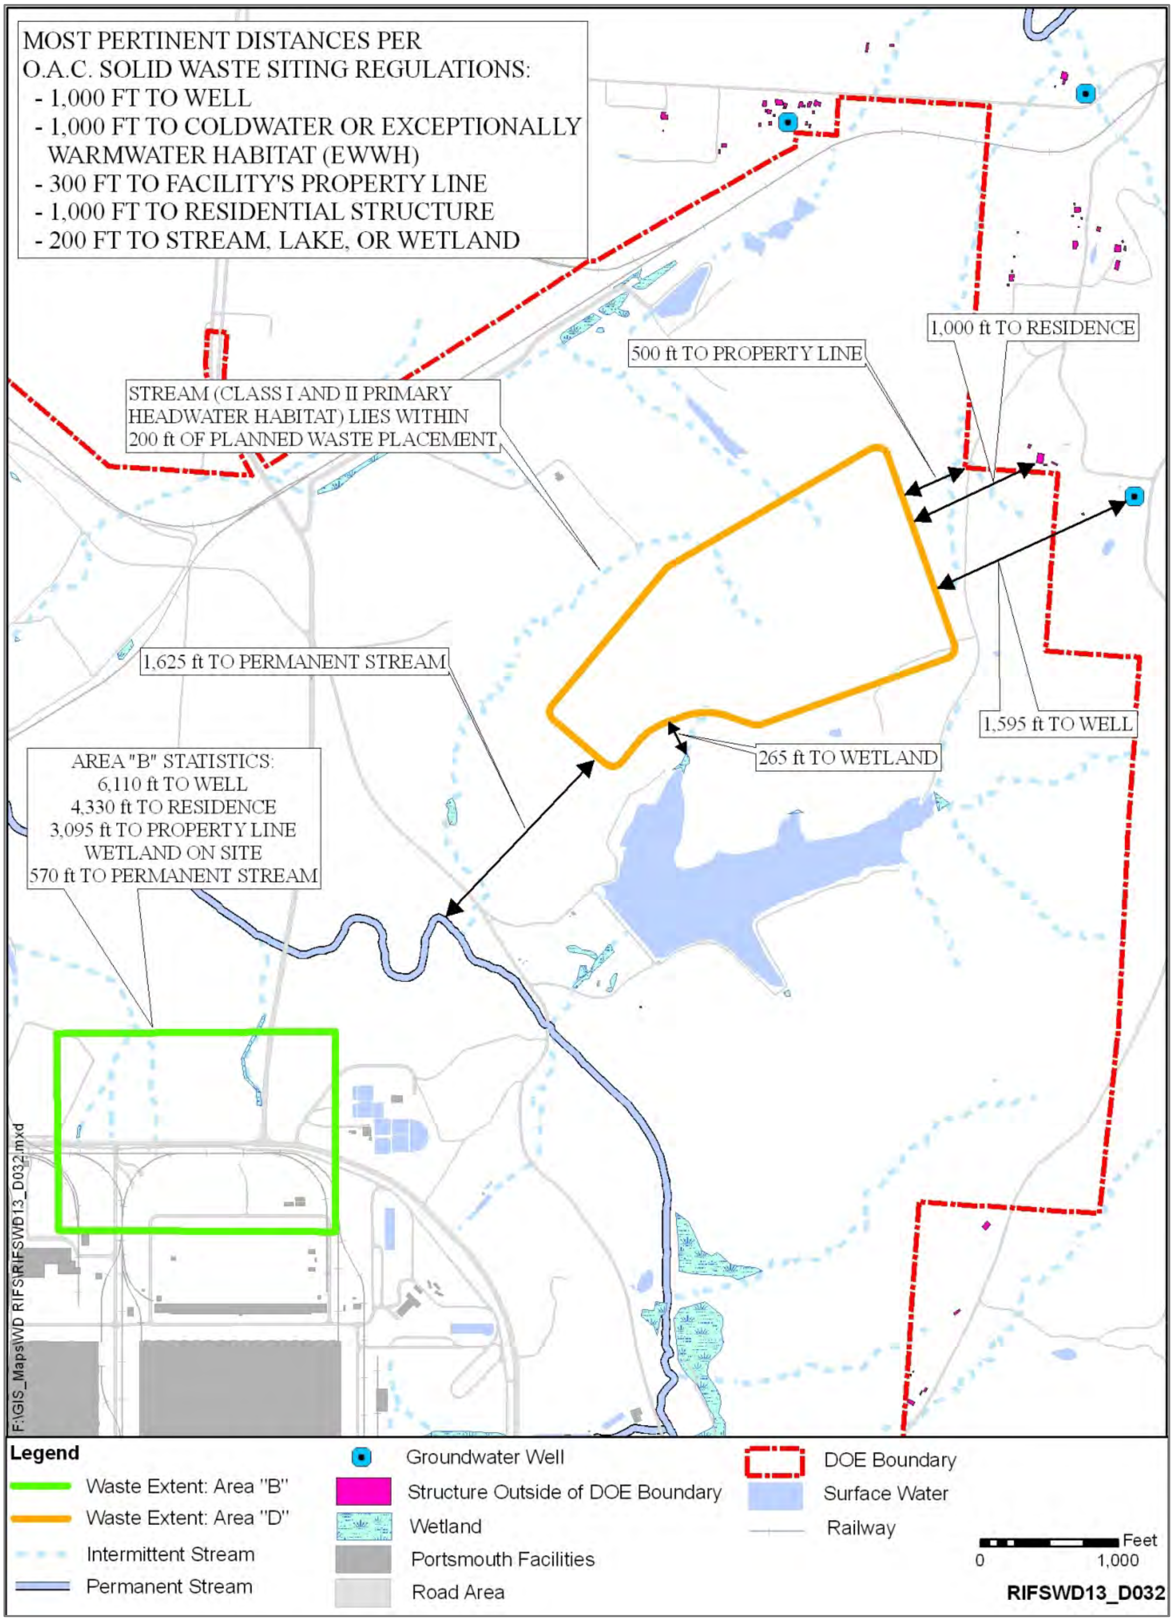

Figure D.33. Siting Considerations for Study Areas B and D at PORTS

D.6.2 SITE SCREENING

One of the primary criteria identified in the DFF&O for consideration of a potential OSDC (or any remedial action) is that it must be protective of human health and the environment. Any properly designed OSDC would be considered protective of human health and the environment because of the design of the impermeable cap and liner systems. However, within the compliance timeframe of 1,000 years or longer, the natural hydrogeologic conditions at each location must be further analyzed in differentiating the degree of protectiveness of the different study areas. Hydrogeologic conditions at each location determine the depth and migration (direction and rate) of groundwater. In the event contaminants migrate through the liner over time, the fate and transport of those contaminants will depend on the hydrogeologic and geochemical conditions of the underlying strata. While a shallow groundwater zone may exist within the regolith and weathered/jointed bedrock, most of this zone would be removed during construction of a potential OSDC. Table D.8 provides a comparison of the protectiveness of each of the study areas relative to each other.

Table D.8. Comparison of Protectiveness at Each Study Area

Criteria	Study Area A	Study Area B	Study Area C	Study Area D
Hydrogeologic Conditions	Study Area A overlies the ancestral river valley with the Gallia sand aquifer. Groundwater moves through the sand towards nearby surface water discharge in Big Run Creek. Minford water table is approximately 15 ft below surface.	Study Area B, similar to Study Area A, overlies the ancestral river valley with the Gallia sand aquifer. Groundwater moves through the sand towards nearby surface water discharge in Little Beaver Creek. Minford water table is less than 15 ft below surface.	Study Area C is underlain by low permeability bedrock. The uppermost aquifer at this study area, the Berea sandstone, is overlain by over 100 ft of low permeability Cuyahoga and Sunbury shale.	Study Area D is similar to Study Area C in that it is underlain by low permeability bedrock. The uppermost aquifer at this study area, the Berea sandstone, is overlain by up to 100 ft of low permeability Cuyahoga and Sunbury shale.
Contaminant Fate and Transport	pWAC modeling indicated Study Area A had travel times to reach peak dose similar to Study Area B (a few organic compounds reached the point of exposure in less than 1,000 years).	pWAC modeling indicated Study Area B had the fastest travel times to reach peak dose compared to the other locations (a few organic compounds reached the point of exposure in less than 1,000 years).	pWAC modeling indicated Study Area C had travel times to reach peak dose several times longer than either Study Areas A or B. No constituents reached peak dose in less than 1,000 years and many constituents took more than 150,000 years.	Study Area D was not modeled for the RI/FS work plan but since the hydrogeology is similar to Study Area C, and the distance to the DOE boundary is greater than Study Area C, the contaminant travel times should be similar, if not greater, than those at Study Area C.
Protectiveness Compared to Other Study Areas	Similar protectiveness as Study Area B; less protective than Study Areas C and D	Similar protectiveness as Study Area A; less protective than Study Areas C and D	Similar protectiveness as Study Area D; more protective than Study Areas A and B	Similar protectiveness as Study Area C; more protective than Study Areas A and B

DOE = U.S. Department of Energy
RI/FS = remedial investigation/feasibility study
pWAC = preliminary waste acceptance criteria (model results reported in the waste disposition RI/FS Work Plan [DOE 2012])

Based on the above analysis, Study Areas C and D are more protective of human health and the environment than Study Areas A and B, therefore Study Areas A and B may be eliminated from further consideration in the context of this siting study. While Study Areas C and D have private groundwater supplies located at closer distances than Study Areas A and B, the underlying hydrogeologic conditions favor much longer travel times for contaminants if released from a potential OSDC. While the differences in protectiveness between Study Areas C and D are not significant enough to eliminate either from further consideration, those differences are discussed in the following section.

D.6.3 EVALUATION OF REMAINING LOCATIONS

This section evaluates the effectiveness and implementability of the two remaining locations as a means to differentiate between them. The purpose of this evaluation is to assess the advantages and disadvantages of the two locations with respect to these general criteria to select a representative location for development of a potential OSDC for this RI/FS.

The effectiveness criterion considers the short- and long-term aspects of the protectiveness, compliance with siting requirements included in the ARARs, and ability to achieve remedial action objectives. As discussed in the previous section, the differences between protectiveness for Study Areas C and D are minor. Both locations have similar hydrogeologic conditions, and contaminant fate and transport at each location would therefore be similar. One area where the two areas differ is in the distances from the extent of waste placement to various points as described in the siting requirements (Table D.9). A greater distance to a point described in the siting requirements represents an additional measure of protectiveness within a given timeframe. As shown in Table D.9, a waste cell in Study Area D is located farther from the DOE boundary, nearest residence, and the nearest private well. A waste cell in Study Area C would be farther from the nearest perennial stream (with potential exceptional warmwater aquatic habitat status) and wetland. The limit of waste at Study Area D would be within 200 ft from an intermittent stream segment preliminarily identified as a Class IIIA PHWH stream. (Both Study Areas C and D include intermittent and/or ephemeral streams within their boundaries.) A waste cell in Study Area C would require a waiver of the siting ARARs because the edge of waste placement would be less than 1,000 ft from the nearest residence, while a waste cell in Study Area D would require a waiver of the siting ARARs because the edge of waste placement would be less than 200 ft from a surface stream.
Figure D.34 shows private groundwater wells located near Study Areas C and D, based on water well records from the ODNR.

Table D.9. Criteria for Evaluating Effectiveness of the Study Areas

Criteria	Study Area C (ft)	Study Area D (ft)
Distance to DOE Boundary	395	500
Distance to nearest residence	760*	1,000
Distance to nearest private groundwater supply	1,000	1,595
Distance to nearest stream (with potential exceptional warmwater aquatic habitat status)	2,085	1,625
Distance to nearest wetland	1,295	265

Distances are measured from “edge of waste placement” based on conceptual design.

*Required distance is 1,000 ft.

DOE = U.S. Department of Energy

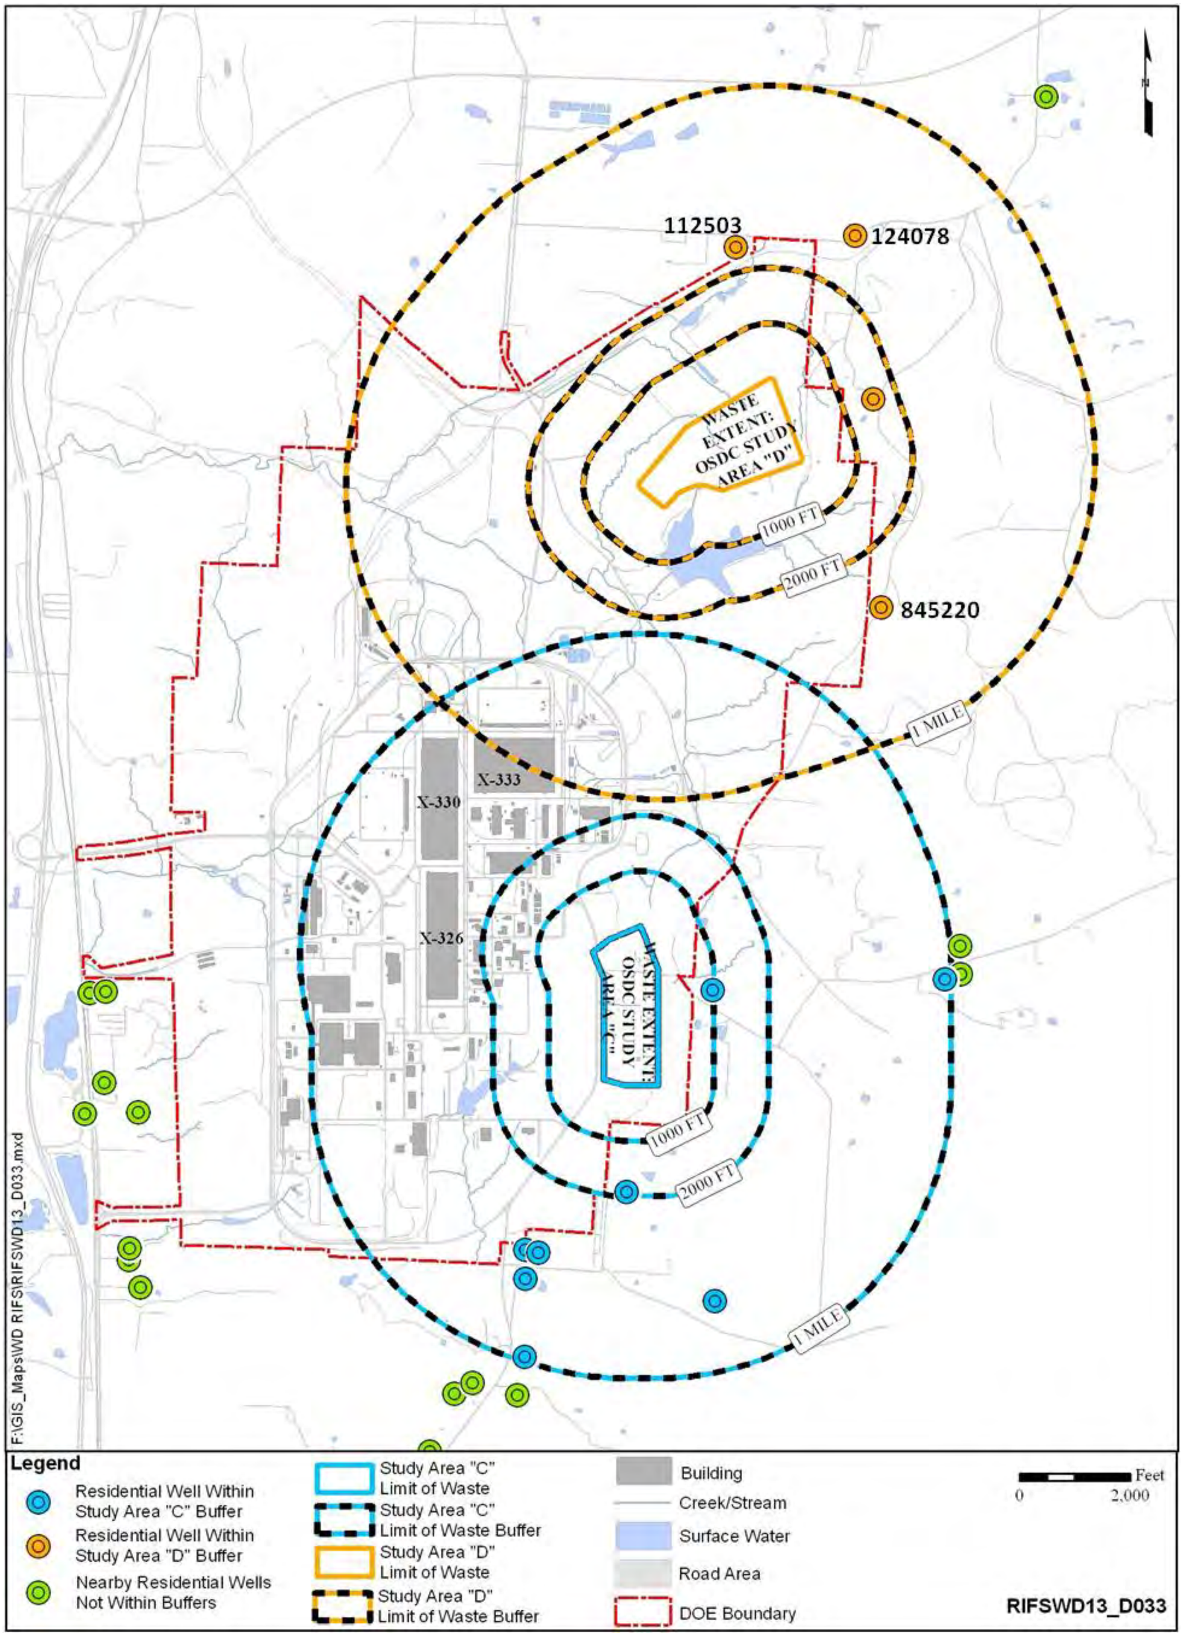

Figure D.34. Private Groundwater Wells Located Near Study Areas C and D at PORTS

The implementability criterion primarily considers the construction and operational considerations of the two locations. This criterion evaluates the amount of site preparation needed for the two locations, the ease of access from the D&D project activities, and the potential for expansion in the event that other wastes from PORTS need disposal in such a facility. Table D.10 compares these criteria for the two study areas.

Table D.10. Criteria for Evaluating Implementability of the Study Areas

Criteria	Study Area C	Study Area D
Site preparation for construction	Similar to Study Area D but would also require relocation of a natural gas pipeline and a portion of Perimeter Road	Requires removal of weathered bedrock to a stable depth with sufficient area for installation of a liner; no infrastructure removal or relocation required
Ease of access from future D&D activities	Closer to the D&D work than Study Area D; requires overpass installation	Farther from the D&D work than Study Area C; requires overpass installation
Potential for expansion to 5 million cy	No space for additional expansion beyond FS D&D capacity requirements (3.9 million cy)	Suitable space for expansion up to 5 million cy

D&D = decontamination and decommissioning
FS = feasibility study

The topography of both Study Areas C and D is hilly, and the areas are heavily wooded with thick vegetation in some areas. For site preparation at Study Area C, clearing and grubbing would be required across the entire area, with approximately 180 acres requiring tree removal. At Study Area D, there are areas of partial clearing, although clearing and grubbing would be required across most of the study area, with approximately 160 acres requiring tree removal. Because both Study Areas C and D contain mature forest habitat, avoiding any clearing during the months of April through September would protect the Indiana bat (even though one has never been seen at PORTS).

Construction of a potential OSDC at Study Area D would require much less overburden soil excavation than at Study Area C, but the amount of bedrock that must be ripped out is greater for the same depth below surface. This quantity can be modified by raising or lowering the base of the waste. The amount of landfill construction materials is comparable between the two locations.

The areal extent of competent bedrock for a potential OSDC at Study Area C is limited. To keep as much of the cell as possible over bedrock and still keep an acceptable distance from the PORTS eastern boundary, the capacity of the cell on bedrock is 2.4 million cy. To achieve sufficient capacity to allow most of the D&D waste to be disposed on Site, the cell would have to extend beyond the bedrock. This extension provides an additional capacity of 1.1 million cy, but the waste that is allowed in this lower area cannot be TSCA-regulated unless a waiver is obtained. The construction of two cells with different WAC could result in more operational complications during waste placement. Additional waste segregation would be required to ensure wastes that cannot meet the administrative WAC for the lower area are not placed there. Additionally, since a potential OSDC is smaller at Study Area C, a higher volume of waste would be required to be shipped off Site.

A potential OSDC at Study Area D has a larger waste storage capacity than the potential OSDC at Study Area C. Based on the location and geological subsurface, it is estimated that roughly 5.0 million cy of capacity is available, if needed. Therefore, the quantity of waste requiring off-Site disposal is far less than that for Study Area C. Further, the operation of a potential OSDC at Study Area D is less complicated than at Study Area C because all cells would have the same WAC, and no additional segregation of waste would be needed. Conceptual OSDC layouts at each study area are provided in Figures D.35 and D.36.

This analysis reflects the high significance placed on both study areas' underlying hydrogeology for limiting the migration of contamination in the event contaminants ever leached through the bottom composite liner. At Study Area D, excavation of much of the 720-ft sandstone lens zone during construction of the bottom liner, and isolation of any of this zone that remains beyond the footprint, will be specified in the final design of the sub-grade to sufficiently eliminate this layer from becoming a lateral pathway for migration of any contaminants outside of the OSDC footprint. Monitoring of the remaining portions of the 720-ft sandstone lens zone will be conducted as part of the overall OSDC monitoring system. Both study areas are considered to be more protective of human health and the environment and generally in compliance with ARARs. (Both Study Area C and D would require a waiver of one of the siting requirements.) Both areas could be developed to accommodate a cell with sufficiently high WAC to allow maximum use of a potential OSDC for containing waste generated from the D&D of the PORTS Facility. Several negative issues with Study Area C include insufficient room to build a potential OSDC that could eventually be expanded to accommodate up to 5 million cy of waste and fill and still keep the beneficial geologic conditions, the fact that more waste would require off-Site disposal, and that the facility at this location encroaches on the required distance to the nearest residence. Therefore, based on this siting analysis, Study Area D is selected as the representative location for alternative development in the RI/FS.

Siting Criteria Summary Relative to Study Area D

Criteria for siting a disposal cell are listed in *OAC* 3745-27-07(H). The proposed limits of waste placement at Study Area D in relation to these criteria are summarized below.

National Parks, National Recreation Areas, and State Parks

The proposed limits of waste placement would not be located within 1,000 ft of a national park or recreation area, candidate park for potential inclusion in the national park system, state park, or established state park purchase area.

Groundwater Aquifer Protection

The proposed disposal facility location is not located in a sand or gravel pit, in a sandstone or limestone quarry, over a sole source aquifer, or above an aquifer capable of producing 100 gpm for a 24-hour period to an existing or future water supply well within 1,000 ft of the limits of waste placement. The isolation distance between the uppermost aquifer system and the bottom of the recompacted soil liner would be greater than 15 ft. (The distance between the bottom of the liner to the top of the Berea sandstone, the uppermost aquifer system at Study Area D, is greater than 70 ft.)

Groundwater Setbacks

The proposed limits of waste would not be located within a 5-year time of travel to any existing or proposed public water supply well, wellhead protection area, or drinking water source protection area for a public water system using groundwater.

The proposed disposal facility location is not located within an area that has been mined underground.

The limits of waste placement would not be located within 1,000 ft of a water supply well or a developed spring.

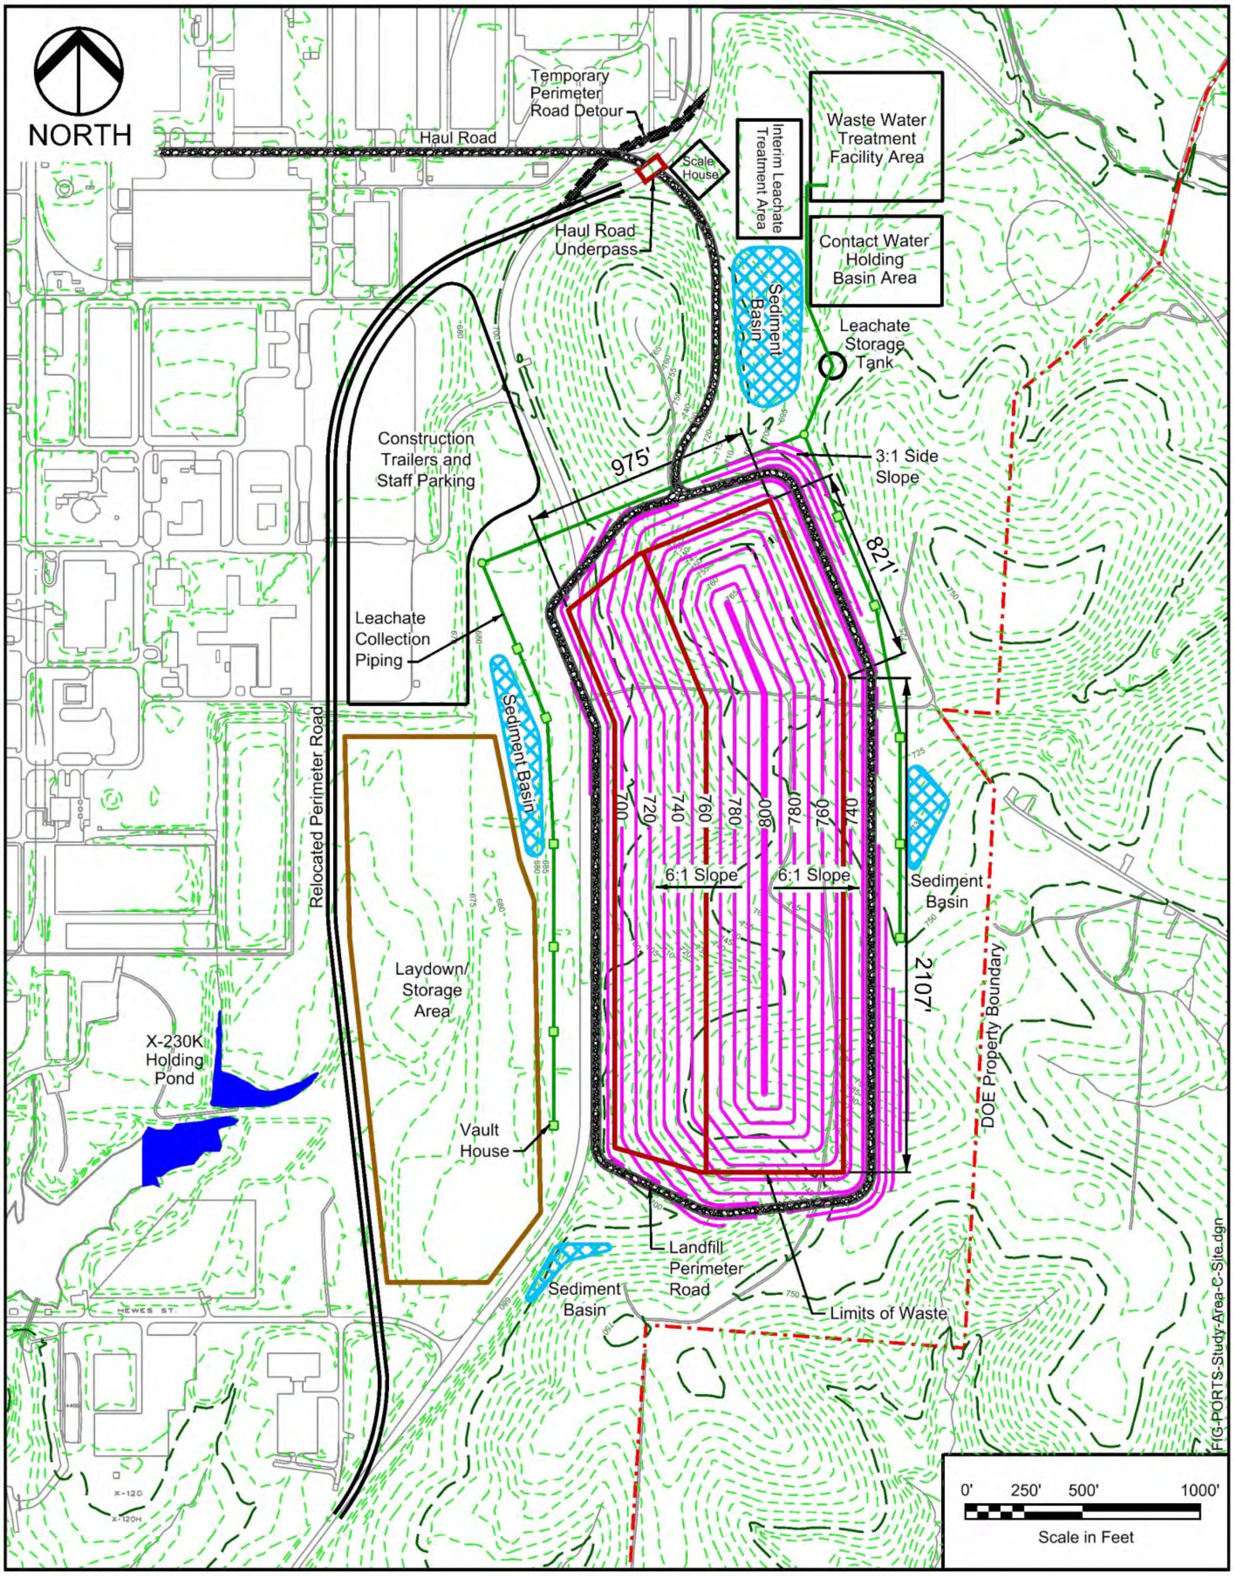

Figure D.35. Landfill Plan View – Finished Grading Plan for Study Area C at PORTS

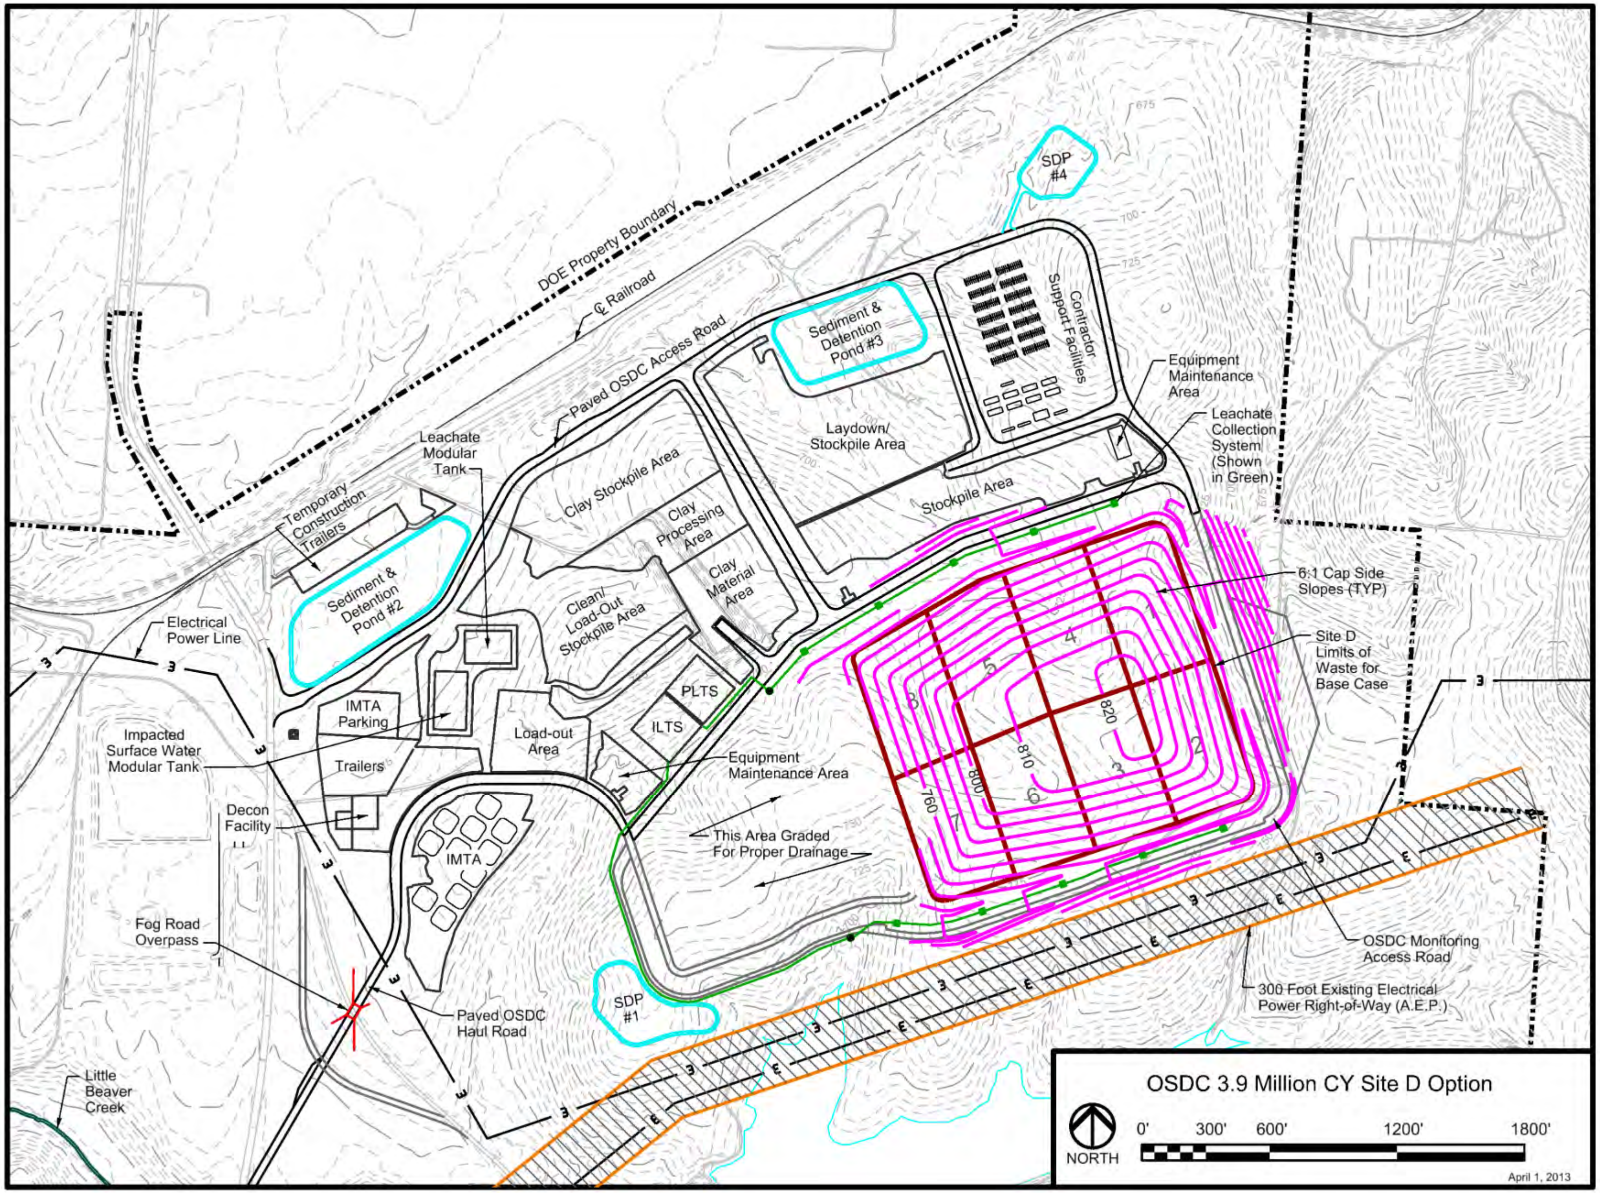

Figure D.36. Landfill Plan View – Finished Grading Plan for Study Area D at PORTS

General Setbacks
The limits of waste placement would not be located within 1,000 ft of areas designated by the ODNR as a state nature or wildlife preserve; a national or state wild, scenic, or recreational river; or an area designated as a special interest or research area.

The proposed disposal facility location is not located within 1,000 ft of a stream designated by Ohio EPA as a coldwater or exceptional warmwater habitat. The nearest streams, Little Beaver Creek and Beaver Creek, are designated as warmwater habitat in *OAC* 3745-0-09.

The limits of waste placement would not be located within 300 ft of the property line.

The limits of waste placement would not be located within 1,000 ft of a domicile.

The proposed limits of waste placement would not be within 200 ft of a lake or wetland. There is a stream in Study Area D, including portions that are designated as Class IIIA PHWH, that would be within 200 ft of the waste placement. The only ARAR waiver required is for the siting requirements in relation to this stream.

OAC 3745-27-20(C) requires a demonstration be made to show that the facility meets location restrictions for airports, floodplains, faults, seismic impact zones, and unstable areas. The following paragraphs provide the location restriction information.

The nearest airport, the Pike County Airport, is located approximately 9.1 miles (48,050 ft) from the proposed disposal facility location. This exceeds the 10,000-ft minimum distance required by *OAC* 3745-27-20(C)(1).

OAC 3745-27-20(C)(2) prohibits the limits of waste placement from being in a regulatory floodplain. The proposed disposal facility location is on the upland areas of the DOE property and does not lie within a 100-year floodplain as depicted on a Federal Insurance Administration flood map.

There are no fault zones with Holocene age displacement in the vicinity of Pike County. The proposed location meets the requirements of *OAC* 3745-27-20(C)(3).

The proposed disposal facility location meets the requirements of *OAC* 3745-27-20(C)(4) with regard to seismic impact zones. The peak ground acceleration is based on a U.S. Geological Survey National Seismic Hazard Map for Ohio (U.S. Geological Survey 2013), which shows a peak acceleration ranging from 0.06 g to 0.08 g with a 2 percent probability in 50 years.

The proposed disposal facility location meets the requirements of *OAC* 3745-27-20(C)(5). The location is not in an area prone to landslides or characterized by poor foundation or subsoil conditions, nor is it characterized as having karst geology. No landslides (historic or current) or areas of susceptibility to landsliding were identified during a field reconnaissance of Study Area D.

Public participation is integral to the DFF&O process. Soliciting public preference on the location of a potential OSDC is critical to the current evaluation of waste disposal alternatives at PORTS. The general siting approach and considerations have been discussed at the PORTS Site Specific Advisory Board (SSAB) meetings and recommendations from the SSAB on siting an on-Site landfill have been received. (The PORTS SSAB also has a subcommittee that is focused on on-Site waste disposition.) The SSAB recommended the following criteria be considered in siting a potential OSDC:

- Possible use of multiple smaller cells
- Ensure minimal footprint/waste minimization/recycling
- Reuse existing landfills if possible
- Areas not conducive for reuse should be considered
- Consider impact on cultural resources
- Blend with existing terrain
- No off-Site waste accepted
- Community benefit-land use management plans should be developed
- Cells should be latest cell technology
- Additional education for community members
- Complimentary use of cell space (solar panels, wind farms, etc.)
- Industrial use clean-up standard.

While no single location can accommodate all of these recommendations, they will be considered in the final selection and design. These criteria do not distinguish between the relative merits of Study Areas C and D; both meet these criteria equally.

RCW	recirculating cooling water
RI	Remedial Investigation
SWMU	solid waste management unit
TCA	trichloroethane
TCE	trichloroethene
TSCA	Toxic Substances Control Act of 1976

This appendix presents a detailed breakdown of decontamination and decommissioning (D&D) (regulatory category [RC]-1) and non-D&D (RC-2) waste volumes used to develop each alternative described in this waste disposition Remedial Investigation/Feasibility Study (RI/FS) report.

The waste volume information presented in this appendix is a waste generation forecast based on a "snap-shot" in time, but it is based on the best professional judgment of the U.S. Department of Energy (DOE), including lessons learned from similar DOE projects. The information in this section is consistent with planning assumptions established in the waste disposition RI/FS Work Plan (DOE 2011). The waste forecast for the Portsmouth Gaseous Diffusion Plant (PORTS) has been developed and examined over many years and was most recently formalized in the Fluor B&W Portsmouth LLC (FBP) project baseline for PORTS. The waste generation forecast will continue to be reviewed extensively as preparations and plans for PORTS D&D mature.

Currently, the waste generation forecast is 1.47 million cy of waste to be generated from D&D of the three large gaseous diffusion buildings and numerous smaller buildings and/or facilities at PORTS (RC-1, engineering category [EC]-1 and EC-2). The volume of waste aligns with the present scope of *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) agreement between DOE and the Ohio Environmental Protection Agency. During demolition, approximately 53,000 cy of residual soil (RC-1, EC-1) are anticipated to be generated. This soil volume is included in the 1.47 million cy volume estimate.

The vast majority of waste expected to be generated during D&D of the PORTS Facility (RC-1) will originate from the three large gaseous diffusion process buildings: X-326, X-330, and X-333. The waste volumes include the structure of each facility, all process and industrial equipment within each facility, and the facility slabs (Attachments E.1, E.2, and E.3). The balance of plant effort consists of hundreds of smaller facilities and includes waste that may be generated before the waste disposition decision is final (Attachment E.4). In this case, the waste will be disposed off Site under an earlier DFF&O decision document. Residual soil (RC-1, EC-1) has been separated in the accompanying tables (Attachment E.5).

The RI/FS also evaluates the impacts of potentially disposing of the Ohio Consent Decree waste (RC-2 as shown in Attachment E.6). An estimate of 710,000 cy is used to represent this volume. Placement of such non-D&D waste as fill would need to meet the requirements of the waste acceptance criteria for the potential on-Site disposal cell (OSDC) in order to be protective of human health and the environment, although additional regulatory approval would be necessary for such excavation of non-D&D waste and the subsequent placement of non-D&D waste in a potential OSDC.

This waste forecast estimate is reasonably conservative, with appropriate accuracy and precision for assessing and estimating remedial alternatives developed in this waste disposition RI/FS report. The volume estimate evolves from field studies, process knowledge, facility walkdowns (including measurements of building structures and components), and engineering studies (including review of as-built drawings).

The accompanying tables are reports from the draft FBP Mass Flow Database, used to support development of the project baseline. These tables provide a detailed breakdown of the waste, by facility and commodity type, expected to be generated by each of the major projects during D&D of the PORTS Facility.

F.1. INTRODUCTION

In accordance with the requirements of *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) and pursuant to Ohio's laws and regulations, and utilizing 40 *Code of Federal Regulations* (*CFR*) 300.430(f)(1)(ii)(B) of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) and the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) as a framework, entirely on-site remedial actions are required to attain applicable or relevant and appropriate requirements (ARARs), unless waived in accordance with the DFF&O and consistent with 40 *CFR* 300.430(f)(1)(ii)(C). The ARARs include only federal and state environmental or facility siting laws/regulations; they do not include occupational safety or worker radiation protection requirements.

Paragraph 9.a of the DFF&O provides that portions of response actions conducted entirely on Site pursuant to work plans or plans concurred with or approved by Ohio Environmental Protection Agency (Ohio EPA) under the Order can be conducted pursuant to Section 121(e)(1) of CERCLA, 42 *United States Code* Section 9621. Section 121(e)(1) specifically provides that no federal, state, or local permit shall be required for the portion of any removal or remedial action conducted entirely as an on-site response action. In addition to "permits," the U.S. Environmental Protection Agency (EPA) has interpreted this section broadly to cover: "all administrative provisions from other laws, such as recordkeeping, consultation, and reporting requirements. In other words, administrative requirements do not apply to on-site response actions." (EPA 1998). Those portions of the remedial action that are taken off Site are subject to both the substantive and administrative requirements of applicable laws.

ARARs are typically divided into three groups: (1) chemical-specific, (2) location-specific, and (3) action-specific. Tables F.1 and F.2 group the ARARs/to-be-considered (guidance) (TBCs) for the on-Site and off-Site disposal alternatives, respectively. Both location- and action-specific ARARs/TBCs are included in Table F.1 (on-Site disposal). Only action-specific ARARs/TBCs are included in Table F.2 (off-Site disposal) because the scope of the action includes only the coordination of the preparation (treatment, as necessary, and packaging) and transport (shipping) of wastes to appropriate off-Site disposal facilities. No chemical-specific ARARs were identified for either alternative. In some cases, the conditions associated with the prerequisite requirements have not been confirmed to be present; if the subject condition is encountered during implementation of the action, then the specified ARAR would be triggered. A brief description of key ARAR/TBC topics follows.

Development of ARARs is an iterative process. This list of ARARs and TBCs will be further evaluated and refined (with further revisions, additions, and deletions potentially occurring) as more information becomes known about proposed remedies and a detailed design is developed for a preferred remedy concurrent with the Proposed Plan stage. The final list of enforceable ARARs and TBCs will be set when the Record of Decision is finalized.

F.2. CHEMICAL-SPECIFIC ARARS/TBCS

Chemical-specific ARARs provide health- or risk-based concentration limits or discharge limitations in various environmental media (i.e., surface water, groundwater, soil, and air) for specific hazardous substances, pollutants, or contaminants. Because this Site-wide Waste Disposition Evaluation Remedial Investigation/Feasibility Study (RI/FS) is not addressing cleanup decisions for contaminated environmental media, chemical-specific ARARs and TBCs are not identified at this stage.

F.3. LOCATION-SPECIFIC ARARS/TBCS

Location-specific requirements establish restrictions on permissible concentrations of hazardous substances or establish requirements for how activities will be conducted because they are in special locations (e.g., wetlands, floodplains, critical habitats, streams). Sensitive resources identified at candidate on-Site disposal cell (OSDC) locations under the on-Site disposal alternative will be protected in accordance with the location-specific ARARs and TBCs listed in Table F.1, as appropriate.

F.3.1 FLOODPLAINS AND WETLANDS

Wetlands, floodplains, and aquatic resources are present on the Portsmouth Gaseous Diffusion Plant (PORTS) Facility. None of the candidate OSDC locations are located within a 100- or 500-year floodplain, and none of the planned activities are expected to impact floodplain areas. Several jurisdictional wetlands have been identified at candidate Site D; the acreages for these wetlands are given in Table D.5 in Appendix D. Site C includes three very small ponds with acreages of 0.093, 0.066, and 0.037 (total area of 0.196 acres). These resources will be appropriately protected in accordance with the location-specific ARARs and TBCs identified in Table F.1. Activities will be designed to avoid or minimize impacts to wetlands. In the event wetlands would be impacted, mitigation activities would be incorporated into design where such impacts occur.

F.3.2 THREATENED AND ENDANGERED SPECIES

A PORTS-wide threatened and endangered species survey, which was completed in 1996, identified a number of potentially suitable habitats at PORTS for federal- and State of Ohio-listed threatened and endangered species, although only one state-listed plant species was actually observed (Lockheed Martin Energy Systems, Inc. [LMES] 1997). None of the identified habitats or species are located within the proposed candidate OSDC locations, and proposed activities are not expected to impact such species or habitats. Therefore, ARARs for protection of these resources are not included in Table F.1.

F.3.3 CULTURAL RESOURCES

Cultural resources include any prehistoric or historic district, site, building, structure, or object resulting from, or modified by, human activity. Under federal regulations (36 *CFR* 800), federal agencies must assess the impacts their actions have on historic properties and, if appropriate, avoid, minimize, or mitigate adverse effects. Historic properties are cultural resources listed in, or eligible for listing in, the NRHP because of their significance and integrity.

The National Historic Preservation Act of 1966 (NHPA), Section 106 requires that a proposed activity be assessed for impacts to buildings/historic structures that are considered historic properties (see Table F.1). The U.S. Department of Energy (DOE) plans and, in certain instances, is already implementing a variety of activities to execute the NHPA ARARs. Because both above- and below-ground activities will occur under the RI/FS and its follow-up implementation of measures to address risks and hazards, DOE will be implementing a planned approach to take into account the potential effect the actions may have on cultural resources. DOE's approach and proposed mitigation measures are described in detail in Section 7.2.2.3.

F.4. ACTION-SPECIFIC ARARS/TBCS

Action-specific ARARs include operation, performance, and design requirements or limitations based on the waste types, media, and removal/remedial activities.

F.4.1 NO ACTION ALTERNATIVE

Pursuant to EPA guidance, there are no ARARs for a No Action alternative (EPA 1991).

F.4.2 ON-SITE DISPOSAL ALTERNATIVE

The action-specific ARARs and TBCs identified in Table F.1 address design, construction, operation, capping, and post-operations care for the preliminary on-Site disposal alternative. These include landfill design and operation requirements under the Toxic Substances Control Act of 1976 (TSCA) and Subtitle C of the Resource Conservation and Recovery Act of 1976, as amended (RCRA), DOE Order 435.1-1 requirements for low-level (radioactive) waste disposal facilities, state requirements under *Ohio Administrative Code (OAC)* 3745-27 for solid waste landfills, and Clean Air Act of 1970 (CAA) requirements for asbestos-containing materials disposal facilities.

The action-specific ARARs and TBCs also include landfill siting requirements for siting waste disposal facilities. The siting requirements and considerations, detailed in Table F.1, can be grouped generally as floodplains, wetlands, seismic considerations, hydrologic considerations, suitable terrain, land use, buffers, and ecological and cultural considerations. Table F.1 also includes location-specific ARARs and TBCs that include siting considerations to protect sensitive resources (e.g., wetlands, floodplains, critical habitats, streams). The Ohio siting criterion under *OAC* 3745-27-07(H)(4)(d) that requires a setback of 200 ft for solid waste placement of solid waste from a stream, lake, or wetland would need to be waived, in accordance with the DFF&O and consistent with 40 *CFR* 300.430(f)(1)(ii)(C), for this alternative. The need for this "greater risk to human health and environment" ARAR waiver is discussed in detail in Section 9.2.2.1.2 of the main text of this document.

In 1993, EPA promulgated rules establishing special units under RCRA, called Corrective Action Management Units (CAMUs), to facilitate treatment, storage, and disposal of hazardous wastes managed for implementing cleanup. CAMUs were also established to remove the disincentives to cleanup that the application of stringent RCRA land disposal restrictions and treatment standards to these wastes (called "remediation wastes") can sometimes impose. The amendments established minimum design and operating standards for CAMUs and minimum treatment standards for wastes placed in CAMUs ("CAMU-eligible wastes"). The rule also amended the regulations for staging piles to expressly allow for mixing, blending, and similar physical operations intended to prepare waste for subsequent management and treatment, and added a provision allowing off-site placement of CAMU-eligible waste in hazardous waste landfills. ARARs for both CAMU and land disposal regulations are included in the Table F.1 while design and waste acceptance criteria for a potential OSDC are being developed and reviewed for protectiveness. Both sets of regulations are being carried forward until protectiveness of a potential OSDC is demonstrated and agreement is reached about what wastes may be CAMU-eligible. Land disposal related ARARs will apply to non CAMU-eligible hazardous wastes. The appropriate set of regulations will be evaluated during remedial design based on the outcome of these decisions.

All primary wastes (e.g., wastes sent to the facility for disposal) and secondary wastes (e.g., contaminated personal protective equipment, decontamination wastes) generated during facility construction and operational activities must be characterized and managed appropriately in accordance with State of Ohio laws and regulations, including but not limited to those for hazardous, solid, and radioactive waste, as well as federal TSCA, DOE Order, and CAA requirements (and the other requirements as specified in the table). Long-term storage of waste would not be anticipated, although provisions for temporary storage are included. Hazardous waste determinations will be based on available process knowledge and sampling/analysis results.

Wastewater, including leachate and contaminated storm water, would be treated on Site for radioactive and nonradioactive constituents, including volatile organic compounds. This treatment would be done at a newly constructed on-Site wastewater treatment unit. Treated effluent would be discharged to surface water via a newly established outfall(s) and in compliance with appropriate outfall limits established in consultation with Ohio EPA to ensure surface water quality standards are not exceeded. Water treatment ARARs are included in Table F.1 to address this potential new unit and outfall(s). It is assumed that the wastewater treatment system would emit less than 10 lb/day of air contaminants in compliance with the de minimis emission limits of *OAC* 3745-15-05(B). This would be evaluated further as the remedial design progresses.

It is anticipated that a potential OSDC would have some capability to treat waste to meet physical or analytical waste acceptance criteria, as deemed necessary. A potential OSDC would be responsible for any necessary treatment and/or off-Site transport of its own facility-generated wastes that cannot meet the waste acceptance criteria for on-Site disposal.

The requirements for a TSCA chemical waste landfill in 40 *CFR* 761.75 would be potential ARARs for disposal of such wastes in an on-Site disposal facility. The TSCA chemical waste landfill design requirements generally follow the RCRA landfill design requirements. TSCA, however, specifies that if a synthetic liner is used, it must have a minimum thickness of 30 mil. In addition, TSCA specifies that the bottom of the liner must be located 50 ft above the historical high groundwater mark and must prohibit any hydrologic connection between the disposal location and any surface water (40 *CFR* 761.75[b][3]). In accordance with the DFF&O, however, the RI/FS will evaluate at least one alternative or subalternative that is fully ARARs-compliant with no ARARs waived.

F.4.3 OFF-SITE DISPOSAL ALTERNATIVE

The off-Site disposal alternative consists of treating (as necessary), packaging, shipping, and disposing all anticipated D&D generated waste to appropriately licensed and permitted off-Site disposal facilities. Coordination of the preparation and transport of wastes to appropriate off-Site disposal facilities would be the responsibility of the Site-wide Waste Disposition Evaluation Project.

As noted in the DFF&O, Paragraph 9.a, the NCP at 40 *CFR* 300.400(e)(1) defines “on-site” as meaning “the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for the implementation of the response action.” Off-Site disposal, by definition, is not an on-Site response action and is subject to all substantive, procedural, and administrative requirements of all legally applicable laws, but not to any requirements that might normally be labeled relevant and appropriate under the ARARs process.

Any wastes transferred off Site or transported in commerce along public rights-of-way must meet the requirements summarized on Table F.2, depending on the type of waste (e.g., hazardous, low-level, mixed, or solid waste). These requirements include packaging, labeling, marking, manifesting, and placarding for hazardous materials in accordance with 49 *CFR* 170-180 *et seq.* Transport of D&D wastes along roads within the PORTS Facility must meet the requirements in the *Transportation Safety Document for the On-site Transfer of Hazardous Material at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (LATA/Parallax Portsmouth, LLC [LPP] 2008).

In addition, in 40 *CFR* 300.440, EPA requires that the off-site transfer of any hazardous substance, pollutant, or contaminant generated during response actions be to a treatment, storage, or disposal facility that complies with applicable federal and state laws. This facility must also have prior EPA approval for acceptance of waste (see also the “Off-Site Rule” at 40 *CFR* 300.440 *et seq.*). Accordingly, before transport, DOE will verify with the appropriate EPA regional contact that any needed off-Site facility is acceptable for receipt of these D&D wastes.

[a] Definitions of terms used in the Ohio solid waste regulations are given in *OAC* 3745-27-01. All *OAC* Chapter 3745-27 rules that refer to the term "aquifer" or "aquifer system" are utilizing those terms as they are defined in *OAC* Rule 3745-27-01(A)(7) and (8). Likewise, the *OAC* Chapter 3745-50 rules that refer to the term "aquifer" are utilizing the term as it is defined in *OAC* Rule 3745-50-10(A)(7)

[b] The requirements portion of the ARARs table is intended to provide a summary of the cited ARAR. The omission of any particular requirement does not limit the scope of the cited ARARs.

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Presence of jurisdictional wetlands	Except as provided under the CWA Section 404(b)(2), no discharge of dredged or fill material into an aquatic ecosystem is permitted if there is a practicable alternative that would have less adverse impact on the aquatic ecosystem or if it will cause or contribute to significant degradation of the waters of the U.S.	Actions that involve the discharge of dredged or fill material into waters of the U.S., including jurisdictional (adjacent) wetlands—**applicable**	40 *CFR* 230.10(a) and (c)
	Except as provided under the CWA Section 404(b)(2), no discharge of dredged or fill material shall be permitted unless appropriate and practicable steps in accordance with 40 *CFR* 230.70 *et seq*. are taken that will minimize potential adverse impacts of the discharge on the aquatic ecosystem.		40 *CFR* 230.10(d)
Water pollution and sludge management violations prohibited.	No entity shall cause pollution or place or cause to be placed any sewage, sludge, sludge materials, industrial waste, or other wastes in a location where they cause pollution of any waters of the state.		*ORC* 6111.04(A)
Presence of wetlands as defined under *OAC* 3745-1-02(B)(90)	Wetlands designated uses, as assigned in accordance with *OAC* 3745-1-54(B)(2), shall be maintained and protected such that degradation of surface waters through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or functions in accordance with the substantive wetland avoidance, minimization, and compensatory mitigation requirements of the paragraphs (D) and (E) of *OAC* 3745-1-54.	Activity that would cause loss of wetlands as defined under *OAC* 3745-1-02(B)(90)—**applicable**	*OAC* 3745-1-54(B)(1) *OAC* 3745-1-51 through -54
	Wetland narrative criteria in *OAC* 3745-1-51(A) shall be protected to prevent significant adverse impacts on the hydrology necessary to support the biological and physical characteristics naturally present in wetlands		
	Wetland narrative criteria in *OAC* 3745-1-51(B) shall be protected to prevent significant adverse impacts on water quality necessary to support existing habitat and populations of wetland flora and fauna and to prevent conditions conducive to the establishment or proliferation of nuisance organisms		

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Presence of "isolated" wetlands as defined under *ORC* 6111.02	No person shall engage in the filling of an isolated wetland unless authorized to do so pursuant to the substantive requirements of a general or individual state isolated wetland permit.	Actions that involve the discharge of dredged or fill material into "isolated wetlands"—**applicable**	*ORC* 6111.021 – 6111.028
	Must comply with the following substantive requirements and conditions of this permit: • Only suitable material free of toxic contaminants in other than trace quantities shall be used as fill material. • Use of asphalt and rubber tires as fill is prohibited. • Wetland narrative and chemical criteria in *OAC* 3745-1-51 and 3745-1-52 shall be maintained in isolated wetlands wholly or partially avoided. • Visible signage, as detailed in the general permit, shall be placed around the delineated boundary of the avoided wetlands.	Category 1 or 2 "isolated wetlands" of a total of ½ acre or less—**applicable**	Ohio General Permit for Filling Category 1 and Category 2 Isolated Wetlands (effective April 10, 2012)
	Mitigation is required either on or off site, or at a mitigation bank within the same U.S. Army COE district as the project location. Mitigation must be conducted in accordance with the ratios established in the general permit depending on the wetland category designation. The mitigation site shall be protected in perpetuity, and appropriate practicable management measures including vegetative buffers shall be implemented to restrict harmful activities that jeopardize the mitigation.	Actions that involve the discharge of dredged or fill material into Category 1 or 2 "isolated wetlands" of a total of ½ acre or less—**applicable**	Ohio General Permit for Filling Category 1 and Category 2 Isolated Wetlands (effective April 10, 2012)
	Aquatic resources		
Location encompassing aquatic ecosystem as defined in 40 *CFR* 230.3(c)	Except as provided under Section 404(b)(2), no discharge of dredged or fill material into an aquatic ecosystem is permitted if there is a practicable alternative that would have less adverse impact on the aquatic ecosystem or if it will cause or contribute to significant degradation of the waters of the U.S.	Action that involves discharge of dredged or fill material into waters of the U.S.—**applicable**	40 *CFR* 230.10(a) and (c) *OAC* 3745-32-05

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Location encompassing aquatic ecosystem as defined in 40 *CFR* 230.3(c) (continued)	Except as provided under Section 404(b)(2), no discharge of dredged or fill material shall be permitted unless appropriate and practicable steps in accordance with the substantive provisions of 40 *CFR* 230.70 *et seq*. are taken that will minimize potential adverse impacts of the discharge on the aquatic ecosystem.		40 *CFR* 230.10(d) *OAC* 3745-32-05
	Consideration of mitigation will occur throughout the activity and includes avoiding, minimizing, rectifying, reducing, or compensating for resource losses. Losses will be avoided to the extent practicable. Compensation may occur on-site or at an off-site location. Mitigation requirements generally fall into three categories:	Action that involves discharge of dredged or fill material into waters of the U.S.—**applicable**	33 *CFR* 320.4(r)(1)
	• Minor project modifications considered feasible (cost, constructability, etc.) and that, if adopted, result in a project that generally meets the purpose and need.		33 *CFR* 320.4(r)(1)(i)
	• Further mitigation measures required to satisfy legal requirements. For CWA 404 applications, mitigation shall be required to ensure project complies with CWA 404(b)(1) Guidelines.		33 *CFR* 320.4(r)(1)(ii)
	• Mitigation measures that may be required as a result of the public interest review process. Such should be developed and incorporated within the public interest review process to the extent that it is found to be reasonable and justified.		33 *CFR* 320.4(r)(1)(iii)
	All compensatory mitigation will be for significant resource losses which are specifically identifiable, reasonably likely to occur, and of importance to the human or aquatic environment. All mitigation will be directly related to the impacts of the proposal, appropriate to the scope and degree of those impacts, and reasonably enforceable.		33 *CFR* 320.4(r)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Location encompassing stream ecosystem – stream antidegradation review requirements	Activities may be approved that lower water quality only if there has been an examination of non-degradation, minimal degradation and mitigative technique alternatives, a review of the social and economic issues related to the activity, a public participation process and appropriate intergovernmental coordination, and it is determined that the lower water quality is necessary to accommodate important social or economic development in the area in which the water body is located. The director may require the applicant to implement a non-degradation alternative, a minimal degradation alternative or a mitigative technique alternative to offset all or part of the proposed lowering of water quality if the director determines that the alternative is technically feasible and economically justifiable. Any lowering of water quality shall not exceed the limitations specified in *OAC* 3745-1-05(C)(6). When making determinations regarding proposed activities that lower water quality the director shall consider the factors listed in *OAC* 3745-1-05(C)(5)(a) through (m).	Action that involves aquatic habitat alterations caused by an activity and associated construction disturbances that would result in the loss of an existing or designated stream use—**applicable**	*OAC* 3745-1-05(C)(5)
Criteria for decision by director	The directors shall evaluate the criteria in *OAC* 3745-32-05 and shall not issue a section 401 water quality certification unless he determines that the applicant has demonstrated that the discharge of dredged or fill material to waters of the state or the creation of any obstruction or alteration in waters of the state will not prevent or interfere with the attainment or maintenance of applicable water quality standards or not result in a violation of any applicable provision of sections of the Federal Water Pollution Control Act listed in *OAC* 3745-32-05(2).	Action that involves aquatic habitat alterations caused by an activity and associated construction disturbances that would result in the loss of an existing or designated stream use—**applicable**	*OAC* 3745-32-05
Criteria applicable to all waters	Water quality criteria in *OAC* 3745-1-04 shall be applied to all surface waters of the state including mixing zones to every extent practical and possible as determined by the director.	Actions that that may result in the lowering of water quality	*OAC* 3745-1-04

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Cultural resources			
Presence of archaeological resources	Must provide for the preservation of significant historical and archeological data which might otherwise be irreparably lost or destroyed as a result of any alteration of terrain caused as a result of any federal construction project.	Federal construction projects that would cause the irreparable loss or destruction of significant historical or archeological resources or data—**applicable**	16 *USC* 469
Presence of human remains, funerary objects, sacred objects, or objects of cultural patrimony for Native Americans	Must stop activities in the area of the discovery and take reasonable effort to secure and protect the objects discovered before resuming activity.	Federal agency construction activities that inadvertently discover Native American cultural items on federal lands—**applicable**	25 *USC* 3002(d) 43 *CFR* 10.4(c) and (d)(2)
Presence of historic resources	Federal agencies must take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register.	Federal agency undertaking that may impact historic properties listed or eligible for inclusion on the National Register of Historic Places—**applicable**	16 *USC* 470f 36 *CFR* 800.1(a)
	Federal agencies must initiate measures to assure that where, as a result of Federal action, a historic property is to be substantially altered or demolished, timely steps are taken to make or have made appropriate records.	Substantial alterations or demolition of a historic property—**applicable**	16 *USC* 470h-2(b)
Action-specific ARARs			
HAZARDOUS WASTE			
Design, construction, operation and closure of a hazardous waste landfill			
Siting of RCRA hazardous waste landfill	Portions of new facilities where treatment, storage, or disposal of hazardous waste will be conducted shall not be located within 61 m (approximately 200 ft) of a fault that had displacement in Holocene time.	Construction of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.18 *OAC* 3745-54-18(A)(1)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Siting Criteria Document Requirements	A hazardous waste facility installation and operation permit cannot be approved unless it is proven that the facility:	Construction of a RCRA hazardous waste landfill—**applicable**	*OAC* 3745-50-38(A)
	• Complies with the hazardous waste standards		*OAC* 3745-50-38(A)(2)
	• Represents the minimum adverse environmental impact, considering the state of available technology and the nature and economics of various alternatives		*OAC* 3745-50-38(A)(3)
	• Represents the minimum risk of all of the following: (i) fires or explosions from TSD methods; (ii) release of hazardous waste during transportation to or from facility; (iii) adverse impact on the public health and safety		*OAC* 3745-50-38(A)(4)(a) – (c)
	• Must not be located within the boundaries of a state park or state park purchase area or national park or recreation area or national park candidate area.		*OAC* 3745-50-38(A)(7)
Design of a RCRA hazardous waste facility	Facilities must be designed, constructed, maintained, and operated to minimize the possibility of a fire, explosion, or any unplanned sudden or nonsudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.	Construction of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.31 *OAC* 3745-54-31
	The operation of a hazardous waste facility shall not cause, permit or allow the emission of any particulate matter, dust, fumes, gas, mist, smoke, or vapor or odorous substance that unreasonably interferes with the comfortable enjoyment of life and property by persons living or working in the vicinity of the facility or that is injurious to public health.	Site where hazardous waste will be managed such that air emissions may occur—**applicable**	*ORC* 3734.02(I)
Liner and leachate collection design for a RCRA landfill	Must install two or more liners and a leachate collection and removal system above and between such liners.	Construction of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.301(c) *OAC* 3745-57-03(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Liner and leachate collection design for a RCRA landfill (continued)	The liner system must include a:		40 *CFR* 264.301(c)(1)(i) *OAC* 3745-57-03(C)(1)(a)
Liner	Top liner, designed and constructed of materials (e.g., geomembrane) to prevent the migration of hazardous constituents into the liner during active life and the post-closure period; and a		40 *CFR* 264.301(c)(1)(i)(A) *OAC* 3745-57-03(C)(1)(a)(i)
	Composite bottom liner consisting of at least two components: • Upper component must be designed and constructed of materials to prevent migration of hazardous constituents into component during active life and post-closure period. • Lower component constructed of at least 3 ft of compacted soil material with a hydraulic conductivity of no more than 1 × 10^{-7} cm/s.		40 *CFR* 264.301(c)(1)(i)(B) *OAC* 3745-57-03(C)(1)(a)(ii)
	Liners must comply with Paragraphs (a)(1)(i), (ii), and (iii) of this section, which states that the liner must be:		40 *CFR* 264.301(c)(1)(ii) *OAC* 3745-57-03(C)(1)(b)
	• Constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients, physical contact with the waste or leachate to which they are exposed, climatic conditions, or stress from installation or daily operation		40 *CFR* 264.301(a)(1)(i) *OAC* 3745-57-03(A)(1)(a)
	• Placed on a foundation or base capable of supporting the liner and resistance to the pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression or uplift		40 *CFR* 264.301(a)(1)(ii) *OAC* 3745-57-03(A)(1)(b)
	• Installed to cover all areas likely to be in contact with the waste or leachate.		40 *CFR* 264.301(a)(1)(iii) *OAC* 3745-57-03(A)(1)(c)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Liner and leachate collection design for a RCRA landfill (continued)	Must be designed, constructed, operated, and maintained to collect and remove leachate from the landfill during the active life and post-closure period and ensure that the leachate depth over the liner does not exceed 30 cm, and comply with Paragraphs (c)(3)(iii) and (iv) of this section.	Construction of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.301(c)(2) *OAC* 3745-57-03(C)(2)
Top leachate collection and removal system	Leachate collection and removal system must be constructed of materials that are:		40 *CFR* 264.301(c)(3)(iii) *OAC* 3745-57-03(C)(3)(c)
	• Chemically resistant to waste managed in landfill and leachate generated.		
	• Of sufficient strength and thickness to prevent collapse under pressures exerted by overlying wastes, waste cover materials, and any equipment used.		
	Must be designed and operated to minimize clogging during the active life of the facility and post-closure care period of the landfill.		40 *CFR* 264.301(c)(3)(iv) *OAC* 3745-57-03(C)(3)(d)
Bottom leachate collection and removal system/leak detection system	Leachate collection and removal system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. Requirements for a leak detection system are satisfied by installation of a system that is:	Construction of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.301(c)(3) *OAC* 3745-57-03(C)(3)
	• Constructed with a bottom slope of 1% or more		40 *CFR* 264.301(c)(3)(i) *OAC* 3745-57-03(C)(3)(a)
	• Constructed of granular drainage materials with a hydraulic conductivity of 1×10^{-2} cm/s and a thickness of 12 in. or more or synthetic or geonet drainage materials with a transmissivity of 3×10^{-5} m^2/s		40 *CFR* 264.301(c)(3)(ii) *OAC* 3745-57-03(C)(3)(b)
	• Constructed of materials that are chemically resistant to waste managed and expected leachate to be generated, and structurally sufficient to resist pressures exerted by waste, cover, and equipment used at the landfill		40 *CFR* 264.301(c)(3)(iii) *OAC* 3745-57-03(C)(3)(c)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Liner and leachate collection design for a RCRA landfill (continued)	• Designed and operated to minimize clogging during the active life of the facility and post-closure care period		40 *CFR* 264.301(c)(3)(iv) *OAC* 3745-57-03(C)(3)(d)
Bottom leachate collection and removal system/leak detection system (continued)	• Constructed with sumps and liquid removal methods (e.g., pumps) of sufficient size to collect and remove liquids from the sump and prevent liquids from backing up. Each unit must have its own sump(s). The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed.		40 *CFR* 264.301(c)(3)(v) *OAC* 3745-57-03(C)(3)(e)
	Must collect and remove liquids in the leak detection system sumps to minimize the head on the bottom liner.		40 *CFR* 264.301(c)(4) *OAC* 3745-57-03(C)(4)
	If the leak detection system is not located completely above the seasonal high water table, a demonstration must be made that the operation of the system will not be adversely affected by groundwater.		40 *CFR* 264.301(c)(5) *OAC* 3745-57-03(C)(5)
Action leakage rate testing for the RCRA leachate detection system	The action leakage rate (maximum design flow rate that the leak detection system can remove without the fluid head on the bottom liner exceeding 1 ft) must include an adequate safety margin to allow for uncertainties in the design, construction, operation, and location of the leak detection system, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the leak detection system, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover, and creep of synthetic components of the system, overburden pressures, etc.).	Construction and operation of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.302(a) *OAC* 3745-57-04(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Action leakage rate testing for the RCRA leachate detection system (continued)	To determine if the action leakage rate has been exceeded, must convert the weekly or monthly flow rate from the monitoring data obtained under 40 *CFR* 264.303(c) to an average daily flow rate (gal/acre/day) for each sump. The average daily flow rate for each sump must be calculated weekly during the active life and closure period, and monthly during the post-closure period when monthly monitoring is required under 40 *CFR* 264.303(c).		40 *CFR* 264.302(b) *OAC* 3745-57-04(B)
Monitoring of liners and cover systems during and after construction and installation	During construction or installation, liners and cover systems must be checked for uniformity, damage, and imperfections (e.g., holes, cracks, thin spots, etc.).	Construction and operation of a RCRA landfill—**applicable**	40 *CFR* 264.303(a) *OAC* 3745-57-05(A)
	Immediately after construction or installations, synthetic liners must be checked to ensure tight seams and joints and the absence of tears, punctures, or blisters; soil based and mixed liners and covers must be checked for imperfections, including lenses, cracks, channels, or other structural nonuniformities.		40 *CFR* 264.303(a)(1) - (2) *OAC* 3745-57-05(A)(1) – (2)
	Must record the amount of liquids removed from the leak detection system sumps at least weekly during the active life and closure period.		40 *CFR* 264.303(c)(1)
Response actions for RCRA leachate detection system	Must develop actions to be taken if action leakage rate has been exceeded.	Operation of a RCRA landfill leak detection system—**applicable**	40 *CFR* 264.304(a) *OAC* 3745-57-06(A)
	If the flow rate into the leak detection system exceeds the action leakage rate for any sump, must determine:	Flow rate into the leak detection system exceeds action leakage rate for any sump—**applicable**	40 *CFR* 264.304 (b) *OAC* 3745-57-06(B)
	• To the extent practicable, the location, size, and cause of any leak		40 *CFR* 264.304 (b)(3) *OAC* 3745-57-06(B)(3)
	• Whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed		40 *CFR* 264.304 (b)(4) *OAC* 3745-57-06(B)(4)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Response actions for RCRA leachate detection system (continued)	• Any other short-term and longer-term actions to be taken to mitigate or stop any leaks.		40 *CFR* 264.304 (b)(5) *OAC* 3745-57-06(B)(5)
	Must assess the source of liquids and amounts of liquids by source; conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and assess the seriousness of any leaks in terms of potential for escaping into the environment; or document why such assessments are not needed.	Leak and/or remediation determinations required—**applicable**	40 *CFR* 264.304(c)(1) and (2) *OAC* 3745-57-06(C)(1) and (2)
Security system for a RCRA landfill	Must prevent the unknowing entry, and minimize the possibility for the unauthorized entry, of persons or livestock onto the active portion of his facility, unless:	Construction and operation of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.14 *OAC* 3745-54-14(A)
	• Physical contact with the waste, structures, or equipment within the active portion of the facility will not injure unknowing or unauthorized persons or livestock which may enter the active portion of a facility		40 *CFR* 264.14(1) *OAC* 3745-54-14(A)(1)
	• Disturbance of the waste or equipment, by the unknowing or unauthorized entry of persons or livestock onto the active portion of a facility, will not cause a violation of the requirements of this part.		40 *CFR* 264.14(2) *OAC* 3745-54-14(A)(2)
	Must have a 24-hour surveillance system which continuously monitors and controls entry onto the active portion of the facility; or an artificial or natural barrier which completely surrounds the active portion of the facility; and a means to control entry, at all times, through the gates or other entrances to the active portion of the facility.		40 *CFR* 264.14(b) *OAC* 3745-54-14(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Security system for a RCRA landfill (continued)	Must post a sign with the legend "Danger – Unauthorized Personnel Keep Out" at each entrance to the active portion of a facility and at other locations in sufficient numbers to be seen from any approach in the active portion. Legend must be written in English and be legible from a distance of at least 25 ft.		40 *CFR* 264.14(c) *OAC* 3745-54-14(C)
Run-on/runoff control systems	A run-on control system must be designed, constructed, operated, and maintained that is capable of preventing flow onto the active portion of the landfill during peak discharge from at least a 25-year storm.	Construction and operation of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.301(g) *OAC* 3745-57-03(G)
	Runoff management system must be able to collect and control the water volume from a runoff resulting from a 24-hour, 25-year storm event.		40 *CFR* 264.301(h) *OAC* 3745-57-03(H)
	Collection and holding facilities must be emptied or otherwise expeditiously managed after storm events to maintain design capacity of the system.		40 *CFR* 264.301(i) *OAC* 3745-57-03(I)
Wind dispersal control system	If the landfill contains any particulate matter which may be subject to wind dispersal, must cover or manage the landfill to control wind dispersal of particulate matter.	Operation of a RCRA hazardous waste landfill**—applicable**	40 *CFR* 264.301(j) *OAC* 3745-57-03(J)
Construction Quality Assurance (CQA) program	A CQA program is required for all surface impoundment, waste pile, and landfill units that are required to comply with paragraphs (C) or (D) of *OAC* 3745-56-21, 3745-56-51, and 3745-57-03. The program must ensure that the constructed unit meets or exceeds all design criteria and specifications, must be developed and implemented under the direction of a CQA officer who is a registered engineer, and must address the physical components listed in *OAC* 3745-54-19(A)(2) where applicable.		40 *CFR* 264.19(a) *OAC* 3745-54-19(A)
	Must develop and implement a written CQA plan as detailed in *OAC* 3745-54-19(B).		40 *CFR* 264.19(b) *OAC* 3745-54-19(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Construction Quality Assurance (CQA) program (continued)	The CQA program must include the observations, inspections, tests and measurements sufficient to meet the assurances listed in *OAC* 3745-54-19(C)(1)(a) to (c) and must include the test fill requirements detailed in *OAC* 3745-54-19(C)(2).		40 *CFR* 264.19(c) *OAC* 3745-54-19(C)
	Waste must not be received in a unit until the owner or operator has submitted to the Director by certified mail or hand delivery a certification signed by the CQA officer that the approved CQA plan has been successfully carried out and that the unit meets the requirements of paragraphs (C) or (D) of *OAC* 3745-56-21, 3745-56-51, or 3745-57-03; and the procedure in *OAC* 3745-50-58(L)(2)(b) has been completed. Documentation supporting the CQA officer's certification must be furnished to the Director upon request.		40 *CFR* 264.19(d) *OAC* 3745-54-19(D)
Post-construction monitoring of liners, leak detection, run-on/runoff systems during active life of facility	Must inspect landfill weekly and after storm events to ensure proper functioning of the run-on and runoff control system, wind dispersal control systems, and the leachate collection and removal systems.	Operation of a RCRA hazardous waste landfill**—applicable**	40 *CFR* 264.303(b) *OAC* 3745-57-05(B)
Facility and equipment inspection, testing and maintenance	Must inspect facility for malfunctions and deterioration, operator errors, and discharges to identify any problems and remedy any deterioration or malfunction of equipment or structures on a schedule and in a manner that ensures that the problem does not lead to an environmental or human health hazard, as detailed in 40 *CFR* 264.15 [*OAC* 3745-54-15].	Operation of a RCRA hazardous waste facility**—applicable**	40 *CFR* 264.15(a) – (d) *OAC* 3745-54-15(A) – (D)
	All facility communications or alarm systems, fire protection equipment, spill control equipment, and decontamination equipment, where required, shall be tested and maintained as necessary to assure its proper operation in time of emergency.		40 *CFR* 264.33 *OAC* 3745-54-33

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Required emergency equipment	All facilities shall be equipped with the following:		40 *CFR* 264.32 *OAC* 3745-54-32
	- An internal communications or alarm system capable of providing immediate emergency instruction to facility personnel		40 *CFR* 264.32(A) *OAC* 3745-54-32(A)
	- A device capable of summoning emergency assistance from local police departments, fire departments, or Ohio EPA or local emergency response teams		40 *CFR* 264.32(B) *OAC* 3745-54-32(B)
	- Portable fire extinguishers, fire control equipment, including but not limited to, special extinguishing equipment, such as that using foam, inert gas, or dry chemicals, spill control equipment, and decontamination equipment		40 *CFR* 264.32(C) *OAC* 3745-54-32(C)
	- Water at adequate volume and pressure to supply water hose streams, or foam producing equipment, or automatic sprinklers, or water spray systems.		40 *CFR* 264.32(D) *OAC* 3745-54-32(D)
Access to communications or alarm system	Whenever hazardous waste is being poured, mixed, spread, or otherwise handled, all personnel involved in the operation shall have immediate access to an internal alarm or emergency communication device, either directly or through visual or voice contact with another employee, unless such a device is not required under 40 *CFR* 264.32 [*OAC* 3745-54-32].	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.34(a) *OAC* 3745-54-34(A)
	If there is only one employee on the premises while the facility is operating, such employee shall have immediate access to a device capable of summoning external emergency assistance, unless such a device is not required under 40 *CFR* 264.32 [*OAC* 3745-54-32].		40 *CFR* 264.34(b) *OAC* 3745-54-34(B)
Required aisle space	Shall maintain aisle space to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless it can be satisfactorily demonstrated that aisle space is not needed for any of these purposes.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.35 *OAC* 3745-54-35

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Purpose and implementation of a contingency plan	Substantive requirements will be met to minimize hazards to human health or the environment from fires, explosions or any unplanned sudden or nonsudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.51(a) *OAC* 3745-54-51(A)
	Substantive requirements shall be implemented immediately whenever there is a fire, explosion or release of hazardous waste or hazardous waste constituents which could threaten human health or the environment.		40 *CFR* 264.51(b) *OAC* 3745-54-51(B)
Content of contingency plan	Comply with the substantive requirements of §§264.51 and 264.56 [rules 3745-54-51 and 3745-54-56 of the Administrative Code] in response to fires, explosions, or any unplanned sudden or nonsudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water at the facility. 40 *CFR* 264.52(a) through (f) [*OAC* 3745-54-52(A) through (F)] describes what must be included in the Plan.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.52 *OAC* 3745-54-52
Emergency coordinator	At all times, there shall be at least one employee either on the facility premises or on call with responsibility for coordinating all internal emergency response measures. This coordinator shall be thoroughly familiar with all aspects of the facility’s contingency plan, all operations and activities at the facility, the locations and characteristics of waste handled, the location of all records within the facility, and the facility layout. In addition, this person shall have the authority to commit the resources needed to implement the contingency plan.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.55 *OAC* 3745-54-55
Emergency procedures	Whenever there is an imminent or actual emergency situation, the emergency coordinator, or his designee when the emergency coordinator is on call, must immediately implement the substantive requirements detailed in 40 *CFR* 264.56 [*OAC* 3745-54-56].	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.56 *OAC* 3745-54-56

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Training requirements	Facility personnel must successfully complete a program of classroom instruction or on-the-job training in accordance with the program outlined in 40 *CFR* 264.16 [*OAC* 3745-54-16] and take part in an annual review of this initial training.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.16 *OAC* 3745-54-16
Inventory requirements	Record on a map the exact location, and dimensions, including depth, of each cell in reference to permanently surveyed benchmarks and document the contents of each cell and the approximate location of each hazardous waste type within each cell.	Operation of a RCRA hazardous waste facility—**applicable**	40 *CFR* 264.309 *OAC* 3745-57-09
Groundwater monitoring at a hazardous waste landfill			
Construction of groundwater monitoring wells	All RCRA monitoring wells must be cased in a manner that maintains the integrity of the monitoring well bore hole. This casing must be screened or perforated and packed with gravel or sand, where necessary to enable collection of groundwater samples. The annular space above the sampling depth must be sealed to prevent contamination of groundwater and samples.	Construction of RCRA groundwater monitoring well—**applicable**	40 *CFR* 264.97(c) *OAC* 3745-54-97(C)
Groundwater monitoring program at a RCRA landfill	Must implement a groundwater monitoring program capable of determining the facility's impact on the quality of groundwater in the uppermost aquifer underlying the facility. Must comply with the substantive requirements of Subpart F 40 *CFR* 264.90 through 264.100 [*OAC* 3745-54-90 through 3745-54-100] for the purposes of detecting, characterizing and responding to releases during the active life of the regulated unit, including the closure and post-closure periods.	Operation of a RCRA hazardous waste unit—**applicable**	40 *CFR* 264.90(a) and (c) *OAC* 3745-54-90(A) and (C)
Groundwater protection standard	Must ensure that hazardous constituents detected in the groundwater from a regulated unit do not exceed the concentration limits for MCLs in the uppermost aquifer underlying the waste management area beyond the point of compliance during the compliance period. Must comply with the substantive requirements for detection, compliance and corrective action monitoring, as appropriate.	Operation of a RCRA groundwater monitoring program—**applicable**	40 *CFR* 264.92 through 264.100 *OAC* 3745-54-92 through 54-100

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
General groundwater monitoring requirements for a RCRA landfill	The groundwater monitoring system must consist of a sufficient number of wells, installed at appropriate locations and depths to yield samples from the uppermost aquifer that: • Represent the quality of background groundwater • Represent the quality of groundwater passing the point of compliance • Allows for the detection of contamination when the hazardous waste or constituents have migrated from the waste management area to the uppermost aquifer.	Operation of a RCRA detection monitoring program under 40 *CFR* 264.98—**applicable**	40 *CFR* 264.97(a) *OAC* 3745-54-97(A)
Groundwater monitoring program for a RCRA landfill	Groundwater monitoring program must include consistent sampling and analysis procedures that are designed to ensure monitoring results that provide a reliable indication of groundwater quality below the waste management area.	Operation of a RCRA detection monitoring program under 40 *CFR* 264.98—**applicable**	40 *CFR* 264.97(d) *OAC* 3745-54-97(D)
	Groundwater monitoring program must include sampling and analytical methods that are appropriate and accurately measure hazardous constituents in groundwater samples.		40 *CFR* 264.97(e) *OAC* 3745-54-97(E)
	Groundwater monitoring program must include a determination of the groundwater surface elevation each time groundwater is sampled.		40 *CFR* 264.97(f) *OAC* 3745-54-97(F)
Groundwater sample collection	The number and size of samples collected to establish background and measure groundwater quality at the point-of-compliance shall be appropriate for the form of statistical test employed following generally accepted statistical principles.	Operation of a RCRA detection monitoring program under 40 *CFR* 264.98—**applicable**	40 *CFR* 264.97(g) *OAC* 3745-54-97(G)
	Shall specify the statistical method, in conformance with 40 *CFR* 264.97(h) [*OAC* 3745-54-97(H)], to be used in evaluating groundwater monitoring data for each hazardous constituent. Statistical method used must be protective of human health and the environment and must comply with performance standards outlined in 40 *CFR* 264.97(i) [*OAC* 3745-54-97(I)].		40 *CFR* 264.97(h) *OAC* 3745-54-97(H) 40 *CFR* 264.97(i) *OAC* 3745-54-97(I)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Groundwater sample collection (continued)	Groundwater monitoring data collected in accordance with 40 *CFR* 264.97(g) [*OAC* 3745-54-97(G)], including actual levels of constituents, must be maintained in the facility operating records.		40 *CFR* 264.97(j) *OAC* 3745-54-97(J)
Detection monitoring for a RCRA landfill	Must monitor for EPA-specified indicator parameters, waste constituents or reaction products that provide a reliable indication of the presence of hazardous constituents in groundwater.	Operation of a RCRA detection monitoring program under 40 *CFR* 264.98—**applicable**	40 *CFR* 264.98(a) *OAC* 3745-54-98(A)
	Must install a groundwater monitoring system at the compliance point as specified under 40 *CFR* 264.95 [*OAC* 3745-54-95] that complies with 264.97(a)(2), (b), and (c) [*OAC* 3745-54-97(A)].		40 *CFR* 264.98(b) *OAC* 3745-54-98(B)
	Must conduct a monitoring program for each EPA-specified chemical parameter and hazardous constituent in accordance with 40 *CFR* 264.97(g) [*OAC* 3745-54-97(G)].		40 *CFR* 264.98(c) *OAC* 3745-54-98(C)
	Sampling frequency shall be sufficient to determine whether there is statistically significant evidence of contamination.		40 *CFR* 264.98(d) *OAC* 3745-54-98(D)
	Must determine the groundwater flow rate and direction in the uppermost aquifer at least annually.		40 *CFR* 264.98(e) *OAC* 3745-54-98(E)
	Must determine whether there is statistically significant evidence of contamination of any EPA-specified chemical parameter or hazardous constituent at a specified frequency.		40 *CFR* 264.98(f) *OAC* 3745-54-98(F)
	If there is statistically significant evidence of contamination at any monitoring well at the compliance point, must follow the substantive provisions of this subsection.		40 *CFR* 264.98(g) *OAC* 3745-54-98(G)

	Closure of a hazardous waste landfill		
Closure performance standard for RCRA hazardous waste management units	Must close the facility in a manner that: • Minimizes the need for further maintenance; and	Closure of a RCRA hazardous waste management unit—**applicable**	40 *CFR* 264.111(a) *OAC* 3745-55-11(A)
	• Controls, minimizes, or eliminates, to the extent necessary to protect human health and environment, post-closure escape of hazardous waste, hazardous constituents, contaminated runoff, or hazardous waste decomposition products to ground or surface waters or to the atmosphere; and		40 *CFR* 264.111(b) *OAC* 3745-55-11(B)
	• Complies with the substantive closure requirements of 40 *CFR* 264 [*OAC* 3745-54 to 3745-57 and 3745-205] for particular type of facility including, but not limited to, requirements of Sections 264.178 (container storage area) [*OAC* 3745-55-78], 264.197 (tanks) [*OAC* 3745-55-97], 264.310 (landfills) [*OAC* 3745-57-10], and 264.554 (remediation waste piles) [*OAC* 3745-56-58].		40 *CFR* 264.111(c) *OAC* 3745-55-11(C)
	Must have a closure plan identifying the steps necessary to perform partial and/or final closure of the facility at any point during its active life and must amend the plan as necessary.		40 *CFR* 264.112 *OAC* 3745-55-12
	During the partial and final closure periods, all contaminated equipment, structures, and soils must be properly disposed or decontaminated.		40 *CFR* 264.114 *OAC* 3745-55-14
Closure of RCRA landfill	Must cover the landfill or cell with a final cover designed and constructed to:	Closure of a RCRA hazardous waste landfill—**applicable**	40 *CFR* 264.310 *OAC* 3745-57-10
	• Provide long-term minimization of migration of liquids through the closed landfill		40 *CFR* 264.310(a)(1) *OAC* 3745-57-10(A)(1)
	• Function with minimum maintenance		40 *CFR* 264.310(a)(2) *OAC* 3745-57-10(A)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Closure of RCRA landfill (continued)	• Promote drainage and minimize erosion or abrasion of the cover		40 *CFR* 264.310(a)(3) *OAC* 3745-57-10(A)(3)
	• Accommodate settling and subsidence so that integrity of the cover is maintained		40 *CFR* 264.310(a)(4) *OAC* 3745-57-10(A)(4)
	• Have a permeability less than or equal to the permeability any bottom liner system or natural subsoils present.		40 *CFR* 264.310(a)(5) *OAC* 3745-57-10(A)(5)
	Post-closure care of a landfill		
Duration of post-closure care	Post-closure care must begin after closure and continue for at least 30 years after that date. The Director may shorten or extend the post-closure period.	Closure of a RCRA hazardous waste disposal unit—**applicable**	40 *CFR* 264.117(a) *OAC* 3745-55-17(A)
Continuation of security requirements	Continuation of the security requirements of 40 *CFR* 264.14 may be required during part or all of the post-closure period when hazardous wastes may remain exposed after completion of partial or final closure or access by the public or domestic livestock may pose a hazard to human health.	Closure of a RCRA hazardous waste disposal unit—**applicable**	40 *CFR* 264.117(b) *OAC* 3745-55-17(B)
Protection of disposal facility	Post-closure use of property must never be allowed to disturb the integrity of the final cover, liners, or any other components of the containment system or the facility's monitoring system unless the disturbance is necessary to the proposed use of the property and will not increase the potential hazard to human health or the environment or it is necessary to reduce a threat to human health or the environment.	Closure of a RCRA hazardous waste disposal unit—**applicable**	40 *CFR* 264.117(c) *OAC* 3745-55-17(C)
Post-closure plan	Must have a post-closure plan identifying the activities that will be carried on after closure of each disposal unit and the frequency of these activities, and must amend the plan as necessary. All post-closure care activities must be in accordance with the approved post-closure care plan.	Closure of a RCRA hazardous waste disposal unit—**applicable**	40 *CFR* 264.117(d) *OAC* 3745-55-17(D) 40 *CFR* 264.118 *OAC* 3745-55-18

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Post-closure plan (continued)	Within 90 days after receiving the final volume of hazardous wastes, must treat, remove from the unit or facility, or dispose of on site, all hazardous wastes in accordance with approved closure plan. The Director may approve a longer period in accordance with 40 *CFR* 264.113(a)(1) and (2) and 264.113(c) [*OAC* 3745-55-13(A)(1) and (2) and 3745-55-13(C)].		40 *CFR* 264.113(a) and (c) *OAC* 3745-55-13(A) and (C)
	Must complete partial and final closure activities in accordance with the approved closure plan within 180 days after receiving the final volume of hazardous wastes at the hazardous waste management unit or facility. The Director may approve a longer closure period in accordance with 40 *CFR* 264.113(b)(1) and (2) and 264.113(c) [*OAC* 3745-55-13(B)(1) and (2) and 3745-55-13(C)].		40 *CFR* 264.113(b) and (c) *OAC* 3745-55-13(B) and (C)
General post-closure care	After final closure, owner or operator must:	Closure of a RCRA hazardous waste landfill**—applicable**	40 *CFR* 264.310(b) *OAC* 3745-57-10(B)
	• Maintain the effectiveness and integrity of the final cover including making repairs to the cap as necessary to correct effects of settling, erosion, subsidence or other events		40 *CFR* 264.310(b)(1) *OAC* 3745-57-10(B)(1)
	• Continue to operate the leachate collection and removal system until leachate is no longer detected		40 *CFR* 264.310(b)(2) *OAC* 3745-57-10(B)(2)
	• Maintain and monitor the leachate detection system in accordance with the substantive requirements in 40 *CFR* 264.301(a)(3)(iv) and (4) and 40 *CFR* 264.303(c)		40 *CFR* 264.310(b)(3) *OAC* 3745-57-10(B)(3)
	• Maintain and monitor a ground water monitoring system and comply with all other applicable provisions 40 *CFR* 264, Subpart F		40 *CFR* 264.310(b)(4) *OAC* 3745-57-10(B)(4)
	• Prevent run-on and runoff from eroding or otherwise damaging final cover		40 *CFR* 264.310(b)(5) *OAC* 3745-57-10(B)(5)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
General post-closure care (continued)	- Protect and maintain surveyed benchmarks used to locate waste cells.		40 *CFR* 264.310(b)(6) *OAC* 3745-57-10(B)(6)
Monitoring of the leachate collection system post-closure	Must record the amount of liquids removed from the leak detection system at least monthly after the final cover is installed and thereafter as specified in 40 *CFR* 264.303(c)(2) [*OAC* 3745-57-05(C)(2)].	Closure of a RCRA landfill—**applicable**	40 *CFR* 264.303(c)(2) *OAC* 3745-57-05(C)(1) to (3)
	Management of wastes in a CAMU		
Designation and management of CAMUs	CAMUs may be designated at a facility. CAMUs are areas within a facility that are used only for managing CAMU-eligible wastes for implementing corrective action or cleanup at the facility. A CAMU must be located within the contiguous property under the control of the owner or operator where the wastes to be managed in the CAMU originated. One or more CAMUs may be designated at a facility.	Management of CAMU-eligible wastes within a CAMU located within the contiguous property under the control of the owner or operator where the wastes to be managed in the CAMU originated—**applicable**	40 *CFR* 264.552(a) *OAC* 3745-57-72(A)
	CAMU-eligible waste means all non-hazardous and hazardous wastes, and all media (including ground water, surface water, soils, and sediments) and debris that are managed for implementing cleanup. As-generated wastes from ongoing industrial operations at a site are not CAMU-eligible wastes.		40 *CFR* 264.552(a)(1)(i) *OAC* 3745-57-72(A)(1)(a)
	Wastes that would otherwise meet the description in paragraph (A)(1)(a) of this rule are not "CAMU-Eligible Wastes" where: (i) The wastes are hazardous wastes found during cleanup in intact or substantially intact containers, tanks, or other non-land-based units found above ground, unless the wastes are first placed in these units as part of cleanup, or the units are excavated during the course of cleanup; or (ii) The director exercises the discretion in paragraph (A)(2) of this rule to prohibit the wastes from management in a CAMU.		40 *CFR* 264.552(a)(1)(ii) *OAC* 3745-57-72(A)(1)(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Designation and management of CAMUs (continued)	Notwithstanding paragraph (A)(1)(a) of this rule, where appropriate, as-generated non-hazardous waste may be placed in a CAMU where such waste is being used to facilitate treatment or the performance of the CAMU.		40 *CFR* 264.552(a)(1)(iii) *OAC* 3745-57-72(A)(1)(c)
	Director may prohibit placement of waste in a CAMU where he has information that such wastes have not been managed in compliance with land disposal treatment or unit design standards or that noncompliance with other applicable standards likely contributed to release of the waste.		40 *CFR* 264.552(a)(2) *OAC* 3745-57-72(A)(2)
	The placement of bulk or noncontainerized liquid hazardous waste or free liquids contained in hazardous waste (whether or not sorbents have been added) in any CAMU is prohibited except where placement of such wastes facilitates the remedy selected for the waste. Certain provisions of 40 *CFR* 264.314 [*OAC* 3745-57-14] regarding liquids, as given in 40 *CFR* 264.552(a)(3) [*OAC* 3745-57-72-(A)(3)] also apply.		40 *CFR* 264.552(a)(3) *OAC* 3745-57-72(A)(3)
	Placement of CAMU-eligible wastes into or within a CAMU does not constitute land disposal of hazardous wastes.		40 *CFR* 264.552(a)(4) *OAC* 3745-57-72(A)(4)
	Consolidation or placement of CAMU-eligible wastes into or within a CAMU does not constitute creation of a unit subject to minimum technology requirements.		40 *CFR* 264.552(a)(5) *OAC* 3745-57-72(A)(5)
	May designate a regulated unit as a CAMU, or may incorporate a regulated unit into a CAMU, if the regulated unit is closed or closing and inclusion of the unit will enhance implementation of effective, protective, and reliable remedial actions for the facility.		40 *CFR* 264.552(b)(1) *OAC* 3745-57-72(B)(1)
	The hazardous waste rules that applied to the regulated unit will continue to apply to that portion of the CAMU after incorporation into the CAMU.		40 *CFR* 264.552(b)(2) *OAC* 3745-57-72(B)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Designation and management of CAMUs (continued)	A CAMU may used for the management of CAMU-eligible waste in accordance with the following requirements of 40 *CFR* 264.552 (*OAC* 3745-57-72): • CAMU shall facilitate implementation of reliable, effective, protective and cost-effective remedies.		40 *CFR* 264.552(c)(1) *OAC* 3745-57-72(C)(1)
	• Waste management activities shall not create unacceptable risks or to the environment resulting from exposure to hazardous wastes or hazardous constituents.		40 *CFR* 264.552(c)(2) *OAC* 3745-57-72(C)(2)
	• CAMU shall include uncontaminated areas of the facility, only if including such areas for the purpose of managing CAMU-eligible waste is more protective than management of such wastes at contaminated areas of the facility.		40 *CFR* 264.552(c)(3) *OAC* 3745-57-72(C)(3)
	• Areas within the CAMU, where wastes remain in place after closure of the CAMU, shall be managed and contained so as to minimize future releases, to the extent practicable.		40 *CFR* 264.552(c)(4) *OAC* 3745-57-72(C)(4)
	• CAMU shall expedite the timing of remedial activity implementation, when appropriate and practicable.		40 *CFR* 264.552(c)(5) *OAC* 3745-57-72(C)(5)
	• CAMU shall enable the use, when appropriate, of treatment technologies (including innovative technologies) to enhance the long-term effectiveness of remedial actions by reducing the toxicity, mobility, or volume of wastes that will remain in place after closure of the CAMU and		40 *CFR* 264.552(c)(6) *OAC* 3745-57-72(C)(6)
	• CAMU shall, to the extent practicable, minimize the land area of the facility upon which wastes will remain in place after closure of the CAMU.		40 *CFR* 264.552(c)(7) *OAC* 3745-57-72(C)(7)
	To designate a CAMU in accordance with the criteria in 40 *CFR* 264.552 (*OAC* 3745-57-72), knowledge of the waste must include		40 *CFR* 264.552(d) *OAC* 3745-57-72(D)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Designation and management of CAMUs (continued)	• The origin of the waste and how it was subsequently managed (including a description of the timing and circumstances surrounding the disposal and/or release);		40 *CFR* 264.552(d)(1) *OAC* 3745-57-72(D)(1)
	• Whether the waste was listed or identified as hazardous at the time of disposal and/or release; and		40 *CFR* 264.552(d)(2) *OAC* 3745-57-72(D)(2)
	• Whether disposal and/or release of the waste occurred before or after the land disposal requirements of 40 *CFR* 268 (*OAC* 3745-270) were in effect for the waste listing or characteristic.		40 *CFR* 264.552(d)(3) *OAC* 3745-57-72(D)(3)
Design, operation, and closure of a CAMU	Director will-designate the requirements for a CAMU, to include the following:	Management of CAMU-eligible wastes within a CAMU located within the contiguous property under the control of the owner or operator where the wastes to be managed in the CAMU originated—**applicable**	40 *CFR* 264.552(e) *OAC* 3745-57-72(E)
	• Areal configuration of the CAMU		40 *CFR* 264.552(e)(1) *OAC* 3745-57-72(E)(1)
	• Specification of applicable design, operation, treatment and closure requirements in the hazardous waste rules.		40 *CFR* 264.552(e)(2) *OAC* 3745-57-72(E)(2)
	Shall comply with the designated substantive minimum design, operation, treatment, and closure standards for a CAMU, including the following:		40 *CFR* 264.552(e)(3) *OAC* 3745-57-72(E)(3)
	• Liners and leachate collection		40 *CFR* 264.552(e)(3)(i) *OAC* 3745-57-72(E)(3)(a)
	• Treatment of principal hazardous constituents		40 *CFR* 264.552(e)(4) *OAC* 3745-57-72(E)(4)
	• Ground water monitoring		40 *CFR* 264.552(e)(5) *OAC* 3745-57-72(E)(5)
	• Capping requirements		40 *CFR* 264.552(e)(6)(iv) *OAC* 3745-57-72(E)(6)(d)
	• Closure and post-closure care.		40 *CFR* 264.552(e)(6) *OAC* 3745-57-72(E)(6)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Design, operation, and closure of a CAMU (continued)	CAMUs into which wastes are placed where all wastes have constituent levels at or below remedial levels or goals applicable to the site do not have to comply with the liner requirements at 40 *CFR* 264.552(e)(3)(i) [*OAC* 3745-57-72(E)(3)(a)], the capping requirements at 40 *CFR* 264.552 (e)(6)(iv) [*OAC* 3745-57-72(E)(6)(d)], or the ground water monitoring requirements at 40 *CFR* 264.552 (e)(5) [*OAC* 3745-57-72(E)(5)].		40 *CFR* 264.552(g) *OAC* 3745-57-72(G)
Designation, design, operation, and closure of a CAMU used for storage and/or treatment only	CAMUs used for storage and/or treatment only are CAMUs in which wastes will not remain after closure. Such CAMUs must be designated in accordance with all of the requirements 40 *CFR* 264.552 [*OAC* 3745-57-72], except as follows:	Management of CAMU-eligible wastes within a CAMU used for storage and/or treatment only—**applicable**	40 *CFR* 264.552(f) *OAC* 3745-57-72(F)
	• Such CAMUs that operate in accordance with time limits established for hazardous waste staging piles are subject to requirements for staging piles in lieu of performance standards and requirements for CAMUs.		40 *CFR* 264.552(f)(1) *OAC* 3745-57-72(F)(1)
	• Such CAMUs that do not operate in accordance with time limits established for hazardous waste staging piles are subject to a time limit, as established by the Director, that is no longer than necessary to achieve a timely remedy selected for the waste, and are subject to requirements for staging piles in lieu of performance standards and requirements for CAMUs.		40 *CFR* 264.552(f)(2) *OAC* 3745-57-72(F)(2)
	The designation of a CAMU does not change Ohio EPA's existing authority to address clean-up levels, media-specific points of compliance to be applied to remediation at a facility, or other remedy selection decisions.		*OAC* 3745-57-72(K)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
	Hazardous waste generation, characterization, and segregation		
Characterization of solid waste (*all primary and secondary wastes*)	Must determine if solid waste is hazardous or is excluded under 40 *CFR* 261.4 [*OAC* 3745-51-04]; and	Generation of solid waste as defined in 40 *CFR* 261.2—**applicable**	40 *CFR* 262.11(a) *OAC* 3745-52-11(A)
	Must determine if waste is listed as a hazardous waste in 40 *CFR* 261 [*OAC* 3745-51-30 to 3745-51-35], or	Generation of solid waste, which is not excluded under 40 *CFR* 261.4—**applicable**	40 *CFR* 262.11(b) *OAC* 3745-52-11(B)
	Must determine whether the waste is identified in Subpart C of 40 *CFR* 261 [*OAC* 3745-51-20 through 3745-51-24], characterizing the waste by using prescribed testing methods or applying generator knowledge based on information regarding material or processes used.	Generation of solid waste that is not listed in Subpart D of 40 *CFR* 261 and not excluded under 40 *CFR* 261.4—**applicable**	40 *CFR* 262.11(c) *OAC* 3745-52-11(C)
	Must refer to 40 *CFR* 261, 262, 264, 265, 266, 268, and 273 [*OAC* 3745-51, 3745-54 to 3745-57, 3745-65 to 3745-69, 3745-205, 3745-256, 3745-266, 3745-270, and 3745-273] for possible exclusions or restrictions pertaining to management of the specific waste.	Generation of solid waste that is determined to be hazardous—**applicable**	40 *CFR* 262.11(d) *OAC* 3745-52-11(D)
Characterization of hazardous waste	Must obtain a detailed chemical and physical analysis of a representative sample of the waste(s) that, at a minimum, contains all the information which must be known to treat, store, or dispose of the waste in accordance with 40 *CFR* 264 and 268 [*OAC* 3745-54 to3745-57, 3745-205, and 3745-270].	Generation of RCRA hazardous waste for storage, treatment, or disposal**—applicable**	40 *CFR* 264.13(a)(1) and (2) *OAC* 3745-54-13(A)(1) and (2)
Determinations for land disposal of hazardous waste	Must determine if the waste meets the treatment standards in 40 *CFR* 268.40, 268.45, or 268.49 [*OAC* 3745-270-40, 3745-270-45, and 3745-270-49] by testing in accordance with prescribed methods or use of generator knowledge of waste.	Generation of RCRA hazardous waste for storage, treatment, or disposal**—applicable**	40 *CFR* 268.7(a) *OAC* 3745-270-07(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Determinations for land disposal of hazardous waste (continued)	Treatment facilities must test their wastes according to the frequency specified in their waste analysis plans to determine if the waste meets the treatment standards in 40 *CFR* 268.40, 268.45, or 268.49 [*OAC* 3745-270-40, 3745-270-45, and 3745-270-49] prior to disposal.	Treatment of RCRA hazardous waste prior to disposal—**applicable**	40 *CFR* 268.7(b) *OAC* 3745-270-07(B)
	Must determine each EPA Hazardous Waste Number (waste code) to determine the applicable treatment standards under 40 *CFR* 268.40 et seq. [*OAC* 3745-270-40 et seq.].	Generation of RCRA hazardous waste for storage, treatment, or disposal—**applicable**	40 *CFR* 268.9(a) *OAC* 3745-270-09(A)
	Must determine the underlying hazardous constituents [as defined in 40 *CFR* 268.2(i) and *OAC* 3745-270-02] in the waste.	Generation of RCRA characteristically hazardous waste (and is not D001 nonwastewaters treated by CMBST, RORGS, or POLYM of Section 268.42, Table 1) for storage, treatment, or disposal—**applicable**	40 *CFR* 268.9(a) *OAC* 3745-270-09(A)
	Must determine whether the waste meets other applicable treatment standards under 40 *CFR* 268.9 [*OAC* 3745-270-09] for characteristic wastes.	Generation of RCRA characteristically hazardous waste—**applicable**	40 *CFR* 268.9(b) to (d) *OAC* 3745-270-09(B) to (C)
Characterization and management of wastewater (e.g., decon water)	On-site wastewater treatment units (including tank systems, conveyance systems, and ancillary equipment used to treat, store or convey wastewater to the wastewater treatment facility) are exempt from the requirements of RCRA Subtitle C standards.	On-site wastewater treatment units subject to regulation under Section 402 or Section 307(b) of the CWA—**applicable**	40 *CFR* 264.1(g)(6) *OAC* 3745-54-01(G)(6)
Characterization and management of industrial wastewater	Industrial wastewater discharges that are point source discharges subject to regulation under Section 402 of the CWA, as amended, are not solid wastes for the purpose of hazardous waste management.	Generation of industrial wastewater for discharge—**applicable**	40 *CFR* 261.4(a)(2) *OAC* 3745-51-04(A)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Segregation of scrap metal for recycle	Material is not subject to RCRA requirements for generators, transporters, and storage facilities under 40 *CFR* Parts 262 through 266, 268, 270, or 124 [*OAC* 3745-50-40 to 3745-50-235 or 3745-52, -53, -54 to -57, -65 to -69, -205, -256, -266, and -270].	Scrap metal, as defined in 40 *CFR* 261.1(c)(6) intended for recycle—**applicable**	40 *CFR* 261.6(a)(3)(ii) *OAC* 3745-51-06(A)(3)(b)
Management of recyclable materials for precious metal recovery	Recyclable materials being collected, transported or stored that are being reclaimed to recover economically significant amounts of gold, silver, platinum, palladium, iridium, osmium, rhodium, ruthenium, or any combination of these must be managed in accordance with the substantive requirements of 40 *CFR* 266.70 [*OAC* 3745-266-70].	Management of recyclable materials for precious metal recovery—**applicable**	40 *CFR* 266.70 *OAC* 3745-266-70
Management of spent lead acid batteries being reclaimed	Spent lead acid batteries being collected, transported and stored prior to regeneration must be managed in accordance with particular hazardous waste requirements depending on permit status and whether they are being reclaimed through regeneration or in other ways. Management options are detailed in 40 *CFR* 266.80 [*OAC* 3745-266-80]. Spent lead acid batteries can also be managed as universal wastes under 40 *CFR* 273 [*OAC* 3745-273].	Management of spent lead acid batteries being reclaimed—**applicable**	40 *CFR* 266.80 *OAC* 3745-266-80
	Hazardous waste storage		
Storage of hazardous wastes restricted from land disposal	Prohibits storage of hazardous waste restricted from land disposal unless the generator stores such waste in tanks, containers, or containment buildings on site solely for the purpose of accumulating such quantities as necessary to facilitate proper recovery, treatment, or disposal.	Accumulation of hazardous wastes restricted from land disposal solely for purpose of accumulation of quantities as necessary to facilitate proper recovery, treatment, or disposal—**applicable**	40 *CFR* 268.50 *OAC* 3745-270-50

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage and accumulation of hazardous waste in containers on site	A generator may accumulate hazardous waste at the facility provided that: • The waste is placed in containers that comply with 40 *CFR* 265.171-173 (Subpart I) [*OAC* 3745-66-70 to -73]	Accumulation of RCRA hazardous waste on site as defined in 40 *CFR* 260.10—**applicable**	40 *CFR* 262.34(a)(1)(i) *OAC* 3745-52-34(A)(1)(a)
	• Container is marked with the date upon which each period of accumulation begins		40 *CFR* 262.34(a)(2) *OAC* 3745-52-34(A)(2)
	• Container is marked with the words “hazardous waste”		40 *CFR* 262.34(a)(3) *OAC* 3745-52-34(A)(3)
	The generator complies with the requirements in Subparts C and D in 40 *CFR* Part 265, with §265.16, and with 40 *CFR* 268.7(a)(5) [*OAC* 3745-270-07(A)(5); *OAC* 3745-65-16; *OAC* 3745-65-30 to *OAC* 3745-65-37; and *OAC* 3745-65-50 to *OAC* 3745-65-56].	Accumulation of RCRA hazardous waste on site as defined in 40 *CFR* 260.10—**applicable**	40 *CFR* 262.34(a)(4) *OAC* 3745-52-34(A)(4)
	Generator is exempt from all requirements in Subparts G and H of 40 *CFR* Part 265, except for §§ 265.111 and 265.114 [*OAC* 3745- 66-10 to *OAC* 3745-66-21 and *OAC* 3745-66-40 to *OAC* 3745-66-48 except for paragraphs (A) and (B) of *OAC* 3745-66-11 and *OAC* 3745-66-14].		40 *CFR* 262.34(a)(1) *OAC* 3745-52-34(A)(1)(e)
	Container must be marked with either the words “Hazardous Wastes” or with other words that identify the contents.	Accumulation of 55 gal or less of RCRA hazardous waste or 1 qt or less of acutely hazardous waste at or near any point of generation—**applicable**	40 *CFR* 262.34(c)(1)(ii) *OAC* 3745-52-34(C)(1)(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage and accumulation of hazardous waste in containers on site (continued)	For the excess waste, must comply within 3 days with the requirements of *OAC* 3745-52-34(A) or other applicable provisions of Chapter 3745-52 of the Administrative Code. During the 3-day period, comply with *OAC* 3745-52-34(C)(1)(a) and (b). Must mark container holding excess accumulation with the date the excess accumulation began.	Accumulation of more than 55 gal of hazardous waste or more than 1 qt of acutely hazardous waste at or near any point of generation—**applicable**	40 *CFR* 262.34(c)(2) *OAC* 3745-52-34(C)(2)
Accumulation of rejected shipments of hazardous waste	A generator who receives a shipment of hazardous waste back as a rejected load or residue from a facility in accordance with a manifest discrepancy may accumulate the waste on site in accordance with paragraphs (a) and (b) or (d), (e) and (f) of 40 *CFR* 262.34 [(A) and (B) or (D), (E), and (F) of *OAC* 3745-52-34] depending on the amount of hazardous waste on site in that calendar month.	Accumulation of RCRA hazardous waste on site as defined in 40 *CFR* 260.10—**applicable**	40 *CFR* 262.34(m) *OAC* 3745-52-34(M)
Management of hazardous waste stored in containers	If container is not in good condition (e.g., severe rusting, structural defects) or if it begins to leak, must transfer waste into container in good condition.	Storage of RCRA hazardous waste in containers**—applicable**	40 *CFR* 264.171 *OAC* 3745-55-71
	Use container made or lined with materials compatible with waste to be stored so that the ability of the container is not impaired.		40 *CFR* 264.172 *OAC* 3745-55-72
	Keep containers closed during storage, except to add/remove waste.		40 *CFR* 264.173(a) *OAC* 3745-55-73(A)
	Open, handle, and store containers in a manner that will not cause containers to rupture or leak.		40 *CFR* 264.173(b) *OAC* 3745-55-73(B)
Inspection of RCRA container storage area	At least weekly, must inspect areas where containers are stored, looking for leaking containers and for deterioration of containers and the containment system caused by corrosion or other factors.	Storage of RCRA hazardous waste in containers**—applicable**	40 *CFR* 264.174 *OAC* 3745-55-74
Operation of a RCRA container storage area	Area must be sloped or otherwise designed and operated to drain liquid from precipitation, or containers must be elevated or otherwise protected from contact with accumulated liquid.	Storage in containers of RCRA hazardous waste that do not contain free liquids—**applicable**	40 *CFR* 264.175(c) *OAC* 3745-55-75(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Storage of RCRA hazardous waste with free liquids in containers	Area must have a containment system designed and operated in accordance with 40 *CFR* 264.175(b) [*OAC* 3745-55-75(B)] as follows:	Storage of RCRA hazardous waste with free liquids or F020 to F023, F026, and F027 in containers—**applicable**	40 *CFR* 264.175(a) and (d) *OAC* 3745-55-75(A) and (D)
	• A base must underlie the containers which is free of cracks or gaps and is sufficiently impervious to contain leaks, spills, and accumulated precipitation until the collected material is detected and removed.		40 *CFR* 264.175(b)(1) *OAC* 3745-55-75(B)(1)
	• A base must be sloped or the containment system must be otherwise designed and operated to drain and remove liquids resulting from leaks, spills, or precipitation, unless the containers are elevated or are otherwise protected from contact with accumulated liquids.		40 *CFR* 264.175(b)(2) *OAC* 3745-55-75(B)(2)
	• The system must have sufficient capacity to contain 10% of the volume of containers or volume of largest container, whichever is greater.		40 *CFR* 264.175(b)(3) *OAC* 3745-55-75(B)(3)
	• Run-on into the system must be prevented unless the collection system has sufficient capacity to contain along with volume required for containers.		40 *CFR* 264.175(b)(4) *OAC* 3745-55-75(B)(4)
	• Spilled or leaked waste and accumulated precipitation must be removed from the sump or collection area in as timely a manner as is necessary to prevent overflow.		40 *CFR* 264.175(b)(5) *OAC* 3745-55-75(B)(5)
Storage of incompatible waste in containers	Containers holding ignitable or reactive waste must be located at least 15 m (50 ft) from the facility's property line.	Storage of ignitable or reactive RCRA hazardous waste in containers—**applicable**	40 *CFR* 264.176 *OAC* 3745-55-76
	Must not place incompatible wastes in same container unless comply with 40 *CFR* 264.17(b) [*OAC* 3745-54-17(B)].	Storage of "incompatible" RCRA hazardous wastes in containers—**applicable**	40 *CFR* 264.177(a) *OAC* 3745-55-77(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Storage of incompatible waste in containers (continued)	Waste shall not be placed in an unwashed container that previously held an incompatible waste or material.		40 *CFR* 264.177(b) *OAC* 3745-55-77(B)
	A container holding incompatible wastes must be separated from any waste or nearby materials or must protect them from one another by using a dike, berm, wall, or other device.		40 *CFR* 264.177(c) *OAC* 3745-55-77(C)
Temporary storage or treatment of hazardous waste in tanks	Assess tank systems integrity as detailed in 40 *CFR* 264.191 [*OAC* 3745-55-91] and ensure that existing and new tanks have sufficient structural strength that is compatible with the waste to prevent collapse or rupture.	Storage of RCRA hazardous waste in a tank (any portable device in which a material is stored, transported, or disposed of or handled) for a period greater than 90 days before treatment, disposal, or storage elsewhere—**applicable**	40 *CFR* 264.191 *OAC* 3745-55-91
	Design and install tanks and tank systems in accordance with specifications detailed in 40 *CFR* 264.192 [*OAC* 3745-55-92].		40 *CFR* 264.192 *OAC* 3745-55-92
	Provide tanks with secondary containment leak detection system controls in accordance with 40 *CFR* 264.193 [*OAC* 3745-55-93].		40 *CFR* 264.193 *OAC* 3745-55-93
	Operate tanks and tank systems in accordance with the general operating requirements detailed in 40 *CFR* 264.194 [*OAC* 3745-55-94].		40 *CFR* 264.194 *OAC* 3745-55-94
	Must inspect tanks and tank systems in accordance with the schedules detailed in 40 *CFR* 264.195 [*OAC* 3745-55-95].		40 *CFR* 264.195 *OAC* 3745-55-95
	Respond to any leaks or spills from tanks systems in accordance with the response actions detailed in 40 *CFR* 264.196 [*OAC* 3745-55-96] and remove unfit tanks from further use.		40 *CFR* 264.196 *OAC* 3745-55-96
	Presents general precautions to be taken to prevent accidental ignition or reaction of ignitable or reactive wastes that are treated or stored in tanks.	Storage of ignitable or reactive hazardous wastes in tanks—**applicable**	40 *CFR* 264.198 *OAC* 3745-55-98
	Presents general precautions to be taken when dealing with incompatible wastes treated or stored in tanks.	Storage of incompatible hazardous wastes in tanks—**applicable**	40 *CFR* 264.199 *OAC* 3745-55-99

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in tanks (continued)	Less stringent minimum technology requirements may be applied to tanks designated as TUs. Protection of human health and the environment must be ensured.	Management of RCRA or CERCLA remediation wastes in tanks designated as TUs—**applicable**	40 *CFR* 264.553 *OAC* 3745-57-73
Temporary storage of RCRA remediation waste in a staging pile	May be temporarily stored (including mixing, sizing, blending, or other similar physical operations intended to prepare the wastes for subsequent management or treatment) at a facility provided that the staging pile:	Accumulation of nonflowing hazardous remediation waste (or remediation waste otherwise subject to land disposal restrictions) as defined in 40 *CFR* 260.10 (*OAC* 3745-50-10)—**applicable**	40 *CFR* 264.554 *OAC* 3745-57-74
	• Is located within the contiguous property under the control of the owner/operator where the wastes to be managed in the staging pile originated. Staging piles must be designated by the director.		40 *CFR* 264.554(a) *OAC* 3745-57-74(A)
	• Staging piles may be used to store hazardous remediation waste (or remediation waste otherwise subject to land disposal restrictions) if the standards and design criteria are followed that the director has designated for that staging pile.		40 *CFR* 264.554(b) *OAC* 3745-57-74(B)
	• Knowledge of the waste pile must be sufficient to establish the required standards		40 *CFR* 264.554(c) *OAC* 3745-57-74(C)
	Staging pile must be designed to: • Facilitate a reliable, effective, and protective remedy		40 *CFR* 264.554(d)(1)(i) *OAC* 3745-57-74(D)(1)(a)
	• Prevent or minimize releases of hazardous wastes and constituents into the environment and minimize or adequately control cross-media transfer, as necessary, to protect human health and the environment (e.g., through the use of liners, covers, run-on/runoff controls, as appropriate).		40 *CFR* 264.554(d)(1)(ii) *OAC* 3745-57-74(D)(1)(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage of RCRA remediation waste in a staging pile (continued)	• The staging pile must not operate for more than 2 years, except when the director grants an operating term extension. The 2-year limit, or other operating term specified by the director in the permit, closure plan, or order, is measured from the first time remediation waste is placed into a staging pile. Must maintain a record of the date when remediation waste is first placed into the staging pile for the life of the permit, closure plan, or order, or for 3 years, whichever is longer.		40 *CFR* 264.554(d)(1)(iii) *OAC* 3745-57-74(D)(1)(c)
	In setting the design standards for staging piles, the director will consider the following factors:		40 *CFR* 264.554(d)(2) *OAC* 3745-57-74(D)(2)
	• Length of time the pile will be in operation • Volumes of wastes you intend to store in the pile • Physical and chemical characteristics of the wastes to be stored in the unit; • Potential for releases from the unit; • Hydrogeological and other relevant environmental conditions at the facility that may influence the migration of any potential releases; and • Potential for human and environmental exposure to potential releases from the unit.		
Storage of ignitable or reactive waste in a staging pile	Must not place ignitable or reactive remediation waste in a staging pile unless:	Storage of ignitable or reactive remediation waste in staging pile—**applicable**	40 *CFR* 264.554(e) *OAC* 3745-57-74(E)
	• Waste has been treated, rendered, or mixed before it was placed in the staging pile so that the waste is no longer ignitable or reactive under §261.21 or §261.31 (*OAC* 3745-52-21 or 52-31), and 40 *CFR* 264.17(b) [*OAC* 3745-54-17(B)] has been complied with; or		40 *CFR* 264.554(e)(i) *OAC* 3745-57-74(E)(1)
	• Remediation waste is managed to protect it from exposure to any material or condition that may cause it to ignite or react.		40 *CFR* 264.554(e)(ii) *OAC* 3745-57-74(E)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Storage of incompatible waste in a staging pile	Must not place incompatible wastes in same pile unless comply with 40 *CFR* 264.17(b) [*OAC* 3745-54-17(B)].	Storage of "incompatible" remediation waste in staging pile—**applicable**	40 *CFR* 264.554(f)(1) *OAC* 3745-57-74(F)(1)
	Incompatible wastes must be separated from any waste or nearby materials or must protect them from one another by using a dike, berm, wall, or other device.		40 *CFR* 264.554(f)(2) *OAC* 3745-57-74(F)(2)
	Must not pile remediation waste on the same base where incompatible wastes or materials were previously piled, unless the base has been decontaminated sufficiently to comply with 40 *CFR* 274.17(b) [*OAC* 3745-54-17(B)].		40 *CFR* 264.554(f)(3) *OAC* 3745-57-74(F)(3)
	Placing hazardous remediation wastes into a staging pile does not constitute land disposal of hazardous waste or create a unit that is subject to the minimum technological requirements of Section 3004(o) of RCRA.	Placement of hazardous remediation wastes into a staging pile—**applicable**	40 *CFR* 264.554(g) *OAC* 3745-57-74(G)
	A staging pile may operate for up to 2 years after hazardous remediation waste is first placed into the pile.		40 *CFR* 264.554(h) *OAC* 3745-57-74(H)
	The director may grant one operating term extension of up to 180 days beyond the operating term limit allowed under 40 *CFR* 264.554(h) [*OAC* 3745-57-74(H)] if he determines that continued operation of the staging pile will not pose a threat to human health and the environment; and that it is necessary to ensure timely and efficient implementation of remedial actions at the facility. The director may, as a condition of the extension, specify further standards and design criteria, as necessary, to ensure protection of human health and the environment.		40 *CFR* 264.554(i) *OAC* 3745-57-74(I)
	To modify a closure plan to incorporate a staging pile or staging pile operating term extension, must follow the applicable requirements under §264.112(c) or §265.112(c) [*OAC* 3745-55-12(C) or *OAC* 3745-66-12(C)]. To modify an order to incorporate a staging pile or staging pile operating term extension, must follow the terms of the order.		40 *CFR* 264.554(l)(3) and (4) *OAC* 3745-57-74(L)(3) and (4)

Temporary storage or treatment of hazardous waste in waste piles - applicability	*OAC* 3745-56-50 to 3745-56-59 applies to owners and operators of facilities that store or treat hazardous waste in piles, except as *OAC* 3745-54-01 provides otherwise.	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.250(a) *OAC* 3745-56-50(A)
	OAC 3745-56-50 to 3745-56-59 does not apply to owners or operators of waste piles that are closed with wastes left in place. Such waste piles are subject to regulation as landfills under *OAC* 3745-57-02 to 3745-57-17.		40 *CFR* 264.250(b) *OAC* 3745-56-50(B)
	Owner or operator of any waste pile that is inside or under a structure that provides protection from precipitation so that neither run-off nor leachate is generated is not subject to regulation under *OAC* 3745-56-51 or *OAC* 3745-54-90 to 3745-54-101, provided that: • Liquids or materials containing free liquids are not placed in the pile; and • Pile is protected from surface water run-on by the structure or in some other manner; and • Pile is designed and operated to control dispersal of the waste by wind, where necessary, by means other than wetting; and • Pile will not generate leachate through decomposition or other reactions.		40 *CFR* 264.250(c) *OAC* 3745-56-50(C)

Temporary storage or treatment of hazardous waste in waste piles – design and operating requirements	A waste pile (except for an existing portion of a waste pile) must have:	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.251(a) *OAC* 3745-56-51(A)
	(1) A liner that is designed, constructed, and installed to prevent any migration of wastes out of the pile into the adjacent subsurface soil or ground water or surface water at any time during the active life (including the closure period) of the waste pile. The liner may be constructed of materials that may allow waste to migrate into the liner itself (but not into the adjacent subsurface soil or ground water or surface water) during the active life of the facility. The liner must be:		40 *CFR* 264.251(a)(1) *OAC* 3745-56-51(A)(1)
	• Constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrogeologic forces), physical contact with the waste or leachate to which they are exposed, climate conditions, the stress of installation, and the stress of daily operation; and		40 *CFR* 264.251(a)(1)(i) *OAC* 3745-56-51(A)(1)(a)
	• Placed upon a foundation or base capable of providing support to the liner and resistance to pressure gradients above and below the liner to prevent failure of liner due to settlement, compression, or uplift; and		40 *CFR* 264.251(a)(1)(ii) *OAC* 3745-56-51(A)(1)(b)
	• Installed to cover all surrounding earth likely to be in contact with the waste or leachate; and		40 *CFR* 264.251(a)(1)(iii) *OAC* 3745-56-51(A)(1)(c)
	(2) A leachate collection and removal system immediately above the liner that is designed, constructed, maintained, and operated to collect and remove leachate from the pile. Design and operating conditions will be specified to ensure that the leachate depth over the liner does not exceed 30 cm (1 ft). The leachate collection and removal system must be:		40 *CFR* 264.251(a)(2) *OAC* 3745-56-51(A)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – design and operating requirements (continued)	• Constructed of materials that are: (i) chemically resistant to waste managed in the pile and the leachate expected to be generated; and (ii) of sufficient strength and thickness to prevent collapse under the pressures exerted by overlaying wastes, waste cover materials, and by any equipment used at the pile; and		40 *CFR* 264.251(a)(2)(i) *OAC* 3745-56-51(A)(2)(a)
	• Designed and operated to function without clogging through the scheduled closure of the waste pile.		40 *CFR* 264.251(a)(2)(ii) *OAC* 3745-56-51(A)(2)(b)
	The owner or operator will be exempted from the requirements of *OAC* 3745-56-51(A) if the Director finds, based on a demonstration by the owner or operator, that alternate design and operating practices, together with location characteristics, will prevent the migration of any hazardous constituents into the ground water or surface water at any future time. In deciding whether to grant an exemption, the Director will consider the factors listed in *OAC* 3745-56-51(B)(1) through (4).		40 *CFR* 264.251(b) *OAC* 3745-56-51(B)
	The owner or operator of each new waste pile unit, each lateral expansion of a waste pile unit, and each replacement of an existing waste pile unit must install two or more liners and a leachate collection and removal system above and between such liners.		40 *CFR* 264.251(c) *OAC* 3745-56-51(C)
	The liner system must include: • A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into such liner during the active life and post-closure care period; and		40 *CFR* 264.251(c)(1)(i)(A) *OAC* 3745-56-51(C)(1)(a)(i)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – design and operating requirements (continued)	• A composite bottom liner consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life and post-closure care period. The lower component must be designed and constructed of materials to minimize migration of hazardous constituents if a breach in the upper component were to occur. Lower component must be constructed of at least 3 ft (91.0 cm) of compacted soil material with a hydraulic conductivity of no more than 1 x 10-7 cm/s.		40 *CFR* 264.251(c)(1)(i)(B) *OAC* 3745-56-51(C)(1)(a)(ii)
	The liners must comply with paragraphs (A)(1)(a), (A)(1)(b), and (A)(1)(c) of *OAC* 3745-56-51.		40 *CFR* 264.251(c)(1)(ii) *OAC* 3745-56-51(C)(1)(b)
	The leachate collection and removal system immediately above the top liner must be designed, constructed, operated, and maintained to collect and remove leachate from the waste pile during the active life and post-closure care period. Design and operating conditions will be specified to ensure that the leachate depth over the liner does not exceed 30 cm (1 ft). The leachate collection and removal system must comply with *OAC* 3745-56-51(C)(3)(c) and (C)(3)(d).		40 *CFR* 264.251(c)(2) *OAC* 3745-56-51(C)(2)
	The leachate collection and removal system between the liners, and immediately above the bottom composite liner in the case of multiple leachate collection and removal systems, is also a leak detection system. This leak detection system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. The requirements for a leak detection system in this paragraph are satisfied by installation of a system that is, at a minimum:		40 *CFR* 264.251(c)(3) *OAC* 3745-56-51(C)(3)
	• Constructed with a bottom slope of 1 percent or more;		40 *CFR* 264.251(c)(3)(i) *OAC* 3745-56-51(C)(3)(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – design and operating requirements (continued)	• Constructed of granular drainage materials with a hydraulic conductivity of 1×10^{-2} cm/s or more and a thickness of 12 in. (30.5 cm) or more; or constructed of synthetic or geonet drainage materials with a transmissivity of 3×10^{-5} m^2/s or more;		40 *CFR* 264.251(c)(3)(ii) *OAC* 3745-56-51(C)(3)(b)
	• Constructed of materials that are chemically resistant to the waste managed in the waste pile and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and equipment used at the waste pile;		40 *CFR* 264.251(c)(3)(iii) *OAC* 3745-56-51(C)(3)(c)
	• Designed and operated to minimize clogging during the active life and post-closure period; and		40 *CFR* 264.251(c)(3)(iv) *OAC* 3745-56-51(C)(3)(d)
	• Constructed with sumps and liquid removal methods of sufficient size to collect and remove liquids from sump and prevent liquids from backing up into drainage layer. Each unit must have its own sump(s). Design of each sump and removal system must provide a method for measuring and recording volume of liquids present in sump and of liquids removed.		40 *CFR* 264.251(c)(3)(v) *OAC* 3745-56-51(C)(3)(e)
	The owner or operator must collect and remove pumpable liquids in the leak detection system sumps to minimize the head on the bottom liner.		40 *CFR* 264.251(c)(4) *OAC* 3745-56-51(C)(4)
	The owner or operator of a leak detection system that is not located completely above the seasonal high water table must demonstrate that the operation of the leak detection system will not be adversely affected by the presence of ground water.		40 *CFR* 264.251(c)(5) *OAC* 3745-56-51(C)(5)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – design and operating requirements (continued)	The Director may approve alternative design or operating practices if the owner or operator demonstrates that such design and operating practices, together with location characteristics: (1) will prevent the migration of any hazardous constituent into the ground water or surface water at least as effectively as the liners and leachate collection and removal systems specified in this rule; and (2) will allow detection of leaks of hazardous constituents through the top liner at least as effectively.		40 *CFR* 264.251(d) *OAC* 3745-56-51(D)
	The owner or operator must design, construct, operate, and maintain a run-on control system capable of preventing flow onto the active portion of the pile during peak discharge from at least a 25-year storm.		40 *CFR* 264.251(g) *OAC* 3745-56-51(G)
	The owner or operator must design, construct, operate, and maintain a run-off management system to collect and control at least the water volume resulting from a 24-hour, 25-year storm.		40 *CFR* 264.251(h) *OAC* 3745-56-51(H)
	Collection and holding facilities (e.g., tanks or basins) associated with run-on and run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain design capacity of the system.		40 *CFR* 264.251(i) *OAC* 3745-56-51(I)
	If the pile contains any particulate matter which may be subject to wind dispersal, the owner or operator must cover or otherwise manage the pile to control wind dispersal.		40 *CFR* 264.251(j) *OAC* 3745-56-51(J)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Temporary storage or treatment of hazardous waste in waste piles – action leakage rate	The Director will approve an action leakage rate for waste piles subject to *OAC* 3745-56-51(C) or (D). The action leakage rate is the maximum design flow rate that the leak detection system can remove without the fluid head on the bottom liner exceeding 1 ft. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the leak detection system, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the leak detection system, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.252(a) *OAC* 3745-56-52(A)
	To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly flow rate from the monitoring data obtained under paragraph (C) of *OAC* 3745-56-54 to an average daily flow rate (gal/acre/day) for each sump. Unless the Director approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period.		40 *CFR* 264.252(b) *OAC* 3745-56-52(B)
Temporary storage or treatment of hazardous waste in waste piles – response actions	The owner or operator of waste pile units subject to paragraph (C) or (D) of *OAC* 3745-56-51 must have an approved response action plan before receipt of waste. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in *OAC* 3745-56-53(B).	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.253(a) *OAC* 3745-56-53(A)
	If the flow rate into the leak detection system exceeds the action leakage rate for any sump, owner or operator must: • Notify the director in writing of the exceedance within 7 days of the determination;		40 *CFR* 264.253(b)(1) – (6) *OAC* 3745-56-53(B)(1) – (6)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Temporary storage or treatment of hazardous waste in waste piles – response actions (continued)	• Submit a preliminary written assessment to the Director within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned; • Determine to the extent practicable the location, size, and cause of any leak; • Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed; • Determine any other short-term and long-term actions to be taken to mitigate or stop any leaks; and • Within 30 days after notification that the action leakage rate has been exceeded, submit to the Director the results of the analyses specified in paragraphs (B)(3), (B)(4), and (B)(5) of this rule, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit a report summarizing the results of any remedial actions taken and actions planned.		
	To make the leak and/or remediation determinations in *OAC* 3745-56-53(B)(3), (B)(4), and (B)(5), the owner or operator must: • Assess the source of liquids and amounts of liquids by source; • Conduct fingerprint, hazardous constituent, or other analyses of liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and		40 *CFR* 264.253(c)(1)(i) – (iii) *OAC* 3745-56-53(C)(1)(a) – (c)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – response actions (continued)	• Assess the seriousness of any leaks in terms of potential for escaping into the environment; or		
	Document why such assessments are not needed.		40 *CFR* 264.253(c)(2) *OAC* 3745-56-53(C)(2)
Temporary storage or treatment of hazardous waste in waste piles – monitoring and inspections	During construction or installation, liners and cover systems (e.g., membranes, sheets, or coatings) must be inspected for uniformity, damage, and imperfections (e.g., holes, cracks, thin spots, or foreign materials). Immediately after construction or installation:	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.254(a) *OAC* 3745-56-54(A)
	• Synthetic liners and covers must be inspected to ensure tight seams and joints and the absence of tears, punctures, or blisters; and		40 *CFR* 264.254(a)(1) *OAC* 3745-56-54(A)(1)
	• Soil-based and admixed liners and covers must be inspected for imperfections including lenses, cracks, channels, root holes, or other structural non-uniformities that may cause an increase in the permeability of the liner or cover.		40 *CFR* 264.254(a)(2) *OAC* 3745-56-54(A)(2)
	While a waste pile is in operation, it must be inspected weekly and after storms to detect evidence of any of the following:		40 *CFR* 264.254(b) *OAC* 3745-56-54(B)
	• Deterioration, malfunctions, or improper operation of run-on and run-off control systems; and		40 *CFR* 264.254(b)(1) *OAC* 3745-56-54(B)(1)
	• Proper functioning of wind dispersal control systems, where present; and		40 *CFR* 264.254(b)(2) *OAC* 3745-56-54(B)(2)
	• The presence of leachate in and proper functioning of leachate collection and removal systems, where present.		40 *CFR* 264.254(b)(3) *OAC* 3745-56-54(B)(3)
	An owner or operator required to have a leak detection system under *OAC* 3745-56-51(C) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.		40 *CFR* 264.254(c) *OAC* 3745-56-54(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Temporary storage or treatment of hazardous waste in waste piles – special requirements for ignitable or reactive waste	Ignitable or reactive waste shall not be placed in a waste pile unless the waste and the waste pile satisfy all applicable requirements of *OAC* 3745-270, and:	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.256 *OAC* 3745-56-56
	• Addition of the waste to an existing pile results in waste or mixture no longer meeting the definition of ignitable or reactive waste under *OAC* 3745-51-21 or 3745-51-23 and complies with *OAC* 3745-54-17(B); or		40 *CFR* 264.256(a) *OAC* 3745-56-56(A)
	• The waste is managed in such a way that it is protected from any material or conditions which may cause it to ignite or react.		40 *CFR* 264.256(b) *OAC* 3745-56-56(B)
Temporary storage or treatment of hazardous waste in waste piles – special requirements for incompatible waste	Incompatible wastes, or incompatible wastes and materials (see the appendix to *OAC* 3745-55-99 for examples), shall not be placed in the same pile, unless *OAC* 3745-54-17(B) is complied with.	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.257(a) *OAC* 3745-56-57(A)
	A pile of hazardous waste that is incompatible with any waste or other material stored nearby in other containers, piles, open tanks, or surface impoundments shall be separated from the other materials, or protected from them by means of a dike, berm, wall or other device.		40 *CFR* 264.257(b) *OAC* 3745-56-57(B)
	Hazardous waste shall not be piled on the same base where incompatible wastes or materials were previously piled unless the base has been decontaminated sufficiently to ensure compliance with *OAC* 3745-54-17(B).		40 *CFR* 264.257(c) *OAC* 3745-56-57(C)
Temporary storage or treatment of hazardous waste in waste piles – closure and post-closure care	At closure, the owner or operator must remove or decontaminate all waste residues, contaminated containment system components (liners, etc.), contaminated subsoils, and structures and equipment contaminated with waste and leachate, and manage them as hazardous waste unless *OAC* 3745-51-03(D) applies.	Storage of RCRA hazardous waste in a waste pile—**applicable**	40 *CFR* 264.258(a) *OAC* 3745-56-58(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Temporary storage or treatment of hazardous waste in waste piles – closure and post-closure care (continued)	If, after removing or decontaminating all residues and making all reasonable efforts to effect removal or decontamination of contaminated components, subsoils, structures, and equipment as required in paragraph (A) of this rule, the owner or operator finds that not all contaminated subsoils can be practicably removed or decontaminated, he must close the facility and perform post-closure care in accordance *OAC* 3745-57-10.		40 *CFR* 264.258(b) *OAC* 3745-56-58(B)
	The owner or operator of a waste pile that does not comply with the liner requirements of *OAC* 3745-56-51(A)(1) and is not exempt from them in accordance with *OAC* 3745-56-50(C) or *OAC* 3745-56-51(B) must:		40 *CFR* 264.258(c)(1) *OAC* 3745-56-58(C)(1)
	Include in the closure plan for the pile in accordance with *OAC* 3745-55-12 both a plan for complying with paragraph (A) of this rule and a contingent plan for complying with paragraph (B) of this rule in case not all contaminated subsoils can be practicably removed at closure; and		40 *CFR* 264.258(c)(1)(i) *OAC* 3745-56-58(C)(1)(a)
	Prepare a contingent post-closure plan in accordance with *OAC* 3745-55-18 for complying with paragraph (B) of this rule in case not all contaminated subsoils can be practicably removed at closure.		40 *CFR* 264.258(c)(1)(ii) *OAC* 3745-56-58(C)(1)(b)
	Cost estimates calculated in accordance with *OAC* 3745-55-42 and 3745-55-44 for closure and post-closure care of a pile subject to this paragraph must include the cost of complying with the contingent closure plan and the contingent post-closure plan but are not required to include the cost of expected closure under paragraph (A) of this rule.		40 *CFR* 264.258(c)(2) *OAC* 3745-56-58(C)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
	Hazardous waste treatment/disposal		
Disposal of RCRA-prohibited hazardous waste in a land-based unit	May be land disposed only if it meets the applicable requirements in the table "Treatment Standards for Hazardous Waste" at 40 *CFR* 268.40 (*OAC* 3745-270-40) before land disposal. The table lists either "total waste" standards, "waste-extract" standards, or "technology-specific" standards [as detailed further in 40 *CFR* 268.42 (*OAC* 3745-270-42)].	Land disposal, as defined in 40 *CFR* 268.2, of RCRA prohibited waste [as listed in 40 *CFR* 268.20 to .39 (*OAC* 3745-270-20 to -39)]—**applicable**	40 *CFR* 268.40(a) *OAC* 3745-270-40(A) 40 *CFR* 268.30 to 268.40 *OAC* 3745-270-30 to -40 40 *CFR* 268.42 *OAC* 3745-270-42
	For characteristic wastes (D001 – D043) that are subject to the treatment standards, all underlying hazardous constituents must meet the UTSs specified in 40 *CFR* 268.48 (*OAC* 3745-270-48).	Land disposal of restricted RCRA characteristic wastes (D001-D043) that are not managed in a wastewater treatment unit that is regulated under the CWA or is CWA equivalent, or that are injected into a Class I nonhazardous injection well—**applicable**	40 *CFR* 268.40(e) *OAC* 3745-270-40(E) 40 *CFR* 268.48 *OAC* 3745-270-48
	May be land disposed if the wastes no longer exhibit a characteristic at the point of land disposal, unless the wastes are subject to a specified method of treatment other than DEACT in 40 *CFR* 628.40 (*OAC* 3745-270-48), or are D003 reactive cyanide.	Land disposal of RCRA-restricted characteristic wastes—**applicable**	40 *CFR* 268.1(c)(4)(iv) *OAC* 3745-270-01 (C)(4)
Debris	May be land disposed if treated prior to disposal as provided under the "Alternative Treatment Standards for Hazardous Debris" in 40 *CFR* 268.45(a)(1)-(5) [*OAC* 3745-270-45(A) (1)-(5)] unless it is determined under 40 *CFR* 261.3(f)(2) [*OAC* 3745-51-03(F)(2)] that the debris is no longer contaminated with hazardous waste <u>or</u> the debris is treated to the waste specific treatment standard provided in 40 *CFR* 268.40 (*OAC* 3745-270-40) for the waste contaminating the debris.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous debris—**applicable**	40 *CFR* 268.45(a) *OAC* 3745-270-45(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of RCRA-prohibited hazardous waste in a land-based unit (continued)	The hazardous debris must be treated for each "contaminant subject to treatment," which must be determined in accordance with 40 *CFR* 268.45(b) [*OAC* 3745-270-45(B)].		40 *CFR* 268.45(b) *OAC* 3745-270-45(B)
Soils	May be land disposed if treated prior to disposal according to the alternative treatment standards of 40 *CFR* 268.49(c) [*OAC* 3745-270-49(C)] or according to the UTSs specified in 40 *CFR* 268.48 (*OAC* 3745-270-48) applicable to the listed hazardous waste and/or applicable characteristic of hazardous waste if the soil is characteristic.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous waste and soils —**applicabl**e	40 *CFR* 268.49(b) and (c) *OAC* 3745-270-49(B) and (C)
Variance from a treatment standard for RCRA restricted hazardous wastes	A variance from a treatment standard may be used if it is: • Not physically possible to treat the waste to the level specified in the treatment standard, or by the method specified as the treatment standard, or • Inappropriate to require the waste to be treated to the level specified in the treatment standard or by the method specified as the treatment standard even though such treatment is technically possible. *NOTE:* Variance approval will be granted through the DFF&O document approval process and included in the appropriate DFF&O document.	Generation of a RCRA hazardous waste requiring treatment prior to land disposal—**applicable**	40 *CFR* 268.44 *OAC* 3745-270-44
Disposal of treated hazardous debris	Debris treated by one of the specified extraction or destruction technologies on Table 1 of this section and which no longer exhibits a characteristic is not a hazardous waste and need not be managed in RCRA Subtitle C facility. Hazardous debris contaminated with listed waste that is treated by an immobilization technology must be managed in a RCRA Subtitle C facility.	Treated debris contaminated with RCRA-listed or characteristic waste—**applicable**	40 *CFR* 268.45(c) *OAC* 3745-270-45(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Disposal of hazardous debris treatment residues	Except as provided in 40 *CFR* 268.45(d)(2) and (d)(4) [*OAC* 3745-270-45(D)(2) and (D)(4)], treatment residues must be separated from the treated debris using simple physical or mechanical means, and such residues are subject to the waste-specific treatment standards for the waste contaminating the debris. Layers of debris removed by spalling are hazardous debris that remain subject to the treatment standards.	Residues from the treatment of hazardous debris—**applicable**	40 *CFR* 268.45(d)(1) – (5) *OAC* 3745-270-45(D)(1) – (5)
Prohibition of dilution to meet LDRs	Except as provided under 40 *CFR* 268.3(b) [*OAC* 3745-270-03(B)], must not in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with land disposal restriction levels.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous waste—**applicabl**e	40 *CFR* 268.3(a) *OAC* 3745-270-03(A)
	It is a form of impermissible dilution, and therefore prohibited, to add iron filings or other metallic forms of iron to lead-containing hazardous wastes in order to achieve any land disposal restriction treatment standard for lead.		*OAC* 3745-270-03(D)
Disposal requirements for particular RCRA waste forms and types	Must not be placed in a landfill unless the waste and the landfill meet applicable provisions of 40 *CFR* 268 and: • The resulting waste, mixture, or dissolution of material no longer is reactive or ignitable. • 40 *CFR* 264.17(b) [*OAC* 3745-54-17(B)] is complied with.	Disposal of ignitable or reactive RCRA waste**—applicable**	40 *CFR* 264.312(a) *OAC* 3745-57-12(A)
	May be landfilled without meeting 40 *CFR* 264.312(a) [*OAC* 3745-57-12(A)], provided wastes are disposed of in such a way that they are protected from any materials or conditions which may cause them to ignite; Must be disposed of in nonleaking containers which are carefully handled and placed to avoid heat, sparks, rupture, or any other condition that might cause ignition of the wastes;	Disposal of ignitable or reactive RCRA waste [except for prohibited wastes which remain subject to treatment standards in 40 *CFR* 268.40 *et seq.*]—**applicable**	40 *CFR* 264.312(b) *OAC* 3745-57-12(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal requirements for particular RCRA waste forms and types (continued)	Must be covered daily with soil or other noncombustible material to minimize the potential of ignition;		
	Must not be disposed of in cells that contain or will contain other wastes which may generate heat sufficient to cause ignition of the waste and		
	Must not be placed into a cell unless 40 *CFR* 264.17(b) [*OAC* 3745-54-17(B)] is complied with.	Disposal of incompatible wastes in a RCRA landfill—**applicable**	40 *CFR* 264.313 *OAC* 3745-57-13
Disposal of bulk or containerized hazardous liquids	The placement of bulk or noncontainerized liquid hazardous waste or hazardous waste containing free liquids (whether or not sorbents have been added) in any landfill is prohibited.	Placement of bulk or containerized hazardous waste liquids in a landfill—**applicable**	40 *CFR* 264.314(a) *OAC* 3745-57-14(A)
	Must use the Paint Filter Liquids Test to demonstrate the absence or presence of free liquids in either a containerized or a bulk waste.		40 *CFR* 264.314(b) *OAC* 3745-57-14(B)
	Containers holding free liquids must not be placed in a landfill, unless:		40 *CFR* 264.314(c) *OAC* 3745-57-14(C)
	• All free-standing liquid has been removed by decanting, or other methods; or has been mixed with sorbent or solidified so that free-standing liquid is no longer observed; or has been otherwise eliminated; or		40 *CFR* 264.314(c)(1) *OAC* 3745-57-14(C)(1)
	• Container is very small, such as an ampule; or		40 *CFR* 264.314(c)(2) *OAC* 3745-57-14(C)(2)
	• Container is designed to hold free liquids for use other than storage, such as a battery or capacitor or		40 *CFR* 264.314(c)(3) *OAC* 3745-57-14(C)(3)
	• Container is a lab pack as defined in 40 *CFR* 264.316 [*OAC* 3745-57-16] and is disposed of in accordance with 40 *CFR* 264.316 [*OAC* 3745-57-16].		40 *CFR* 264.314(c)(4) *OAC* 3745-57-14(C)(4)
	Sorbents used to treat free liquids to be disposed of in landfills must be nonbiodegradable as described in 40 *CFR* 264.314(d)(1) [*OAC* 3745-57-14(D)(1)].		40 *CFR* 264.314(d) *OAC* 3745-57-14(D)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of bulk or containerized hazardous liquids (continued)	The placement of any liquid which is not a hazardous waste in a landfill is prohibited unless it is demonstrated that the only reasonably available alternative is placement in a landfill or unlined surface impoundment which contains or may contain hazardous waste and such placement will not present a risk of contamination of any underground source of drinking water.		40 *CFR* 264.314(e) *OAC* 3745-57-14(E)
	Unless they are very small, containers must be either at least 90% full when placed in the landfill, or crushed, shredded, or similarly reduced in volume to the maximum practical extent before burial in the landfill.		40 *CFR* 264.315 *OAC* 3745-57-15
	Small containers of hazardous waste in overpacked drums (lab packs) may be placed in a landfill if the requirements of this section are met.		40 *CFR* 264.316 *OAC* 3745-57-16
Disposal of hazardous wastes F020, F021, F022, F023, F026, and F027 listed wastes	Disposal of F020, F021, F022, F023, F026, and F027 wastes in a hazardous waste landfill is not permitted unless comply with the substantive requirements for waste management of 40 *CFR* 264.317 [*OAC* 3745-57-17].	Disposal of hazardous wastes F020, F021, F022, F023, F026, and F027—**applicable**	40 *CFR* 264.317 *OAC* 3745-57-17
Treatment and disposal of ignitable, reactive, or incompatible RCRA wastes	Must take precautions to prevent accidental ignition or reaction of waste, and waste must be separated and protected from sources of ignition or reaction.	Operation of a RCRA facility that treats, stores, or disposes of ignitable, reactive, or incompatible wastes—**applicable**	40 *CFR* 264.17(a) *OAC* 3745-54-17(A)
	Must take precautions to prevent reactions that: • Generate extreme heat, pressure, fire or explosion, or violent reactions • Produce uncontrolled toxic mists, fumes, dusts, or gases in sufficient quantities to threaten human health or the environment • Produce uncontrolled flammable fumes or gases in sufficient quantities to pose a risk of fire or explosions • Damage the structural integrity of the device or facility • Through other like means threaten human health or the environment.		40 *CFR* 264.17(b) *OAC* 3745-54-17(B)

	Closure of treatment or storage units		
Closure performance standard for RCRA hazardous waste management units	Must close the facility in a manner that: • Minimizes the need for further maintenance and	Closure of a RCRA hazardous waste management unit—**applicable**	40 *CFR* 264.111(a) *OAC* 3745-55-11(A)
	• Controls, minimizes, or eliminates, to the extent necessary to protect human health and environment, post-closure escape of hazardous waste, hazardous constituents, contaminated runoff, or hazardous waste decomposition products to ground or surface waters or to the atmosphere		40 *CFR* 264.111(b) *OAC* 3745-55-11(B)
	• Complies with the substantive closure requirements of 40 *CFR* 264 [*OAC* 3745-54 to 3745-57 and 3745-205] for particular type of facility including, but not limited to, requirements of Sections 264.178 (container storage area) [*OAC* 3745-55-78], 264.197 (tanks) [*OAC* 3745-55-97], and 264.554 (remediation waste piles) [*OAC* 3745-56-58].		40 *CFR* 264.111(c) *OAC* 3745-55-11(C)
	Must have a closure plan identifying the steps necessary to perform partial and/or final closure of the facility at any point during its active life and must amend the plan as necessary.		40 *CFR* 264.112 *OAC* 3745-55-12
	During the partial and final closure periods, all contaminated equipment, structures, and soils must be properly disposed or decontaminated.	Closure of a RCRA hazardous waste management unit—**applicable**	40 *CFR* 264.114 *OAC* 3745-55-14
Post-closure care of RCRA hazardous waste management unit	Post-closure care in accordance with the substantive requirements of *OAC* 3745-55-17 (A)(1) must begin after closure and continue for at least 30 years after that date. The Director may shorten or extend the post-closure period as indicated to protect human health and the environment.	Closure of a RCRA hazardous waste disposal unit—**applicable**	40 *CFR* 264.117(a)(1) and (2) *OAC* 3745-55-17(A)(1) and (2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Closure of a RCRA container storage unit	Must remove all hazardous waste and residues from containment system. Remaining containers, liners, bases, and soil containing or contaminated with hazardous waste or residues must be decontaminated or removed.	Closure of a RCRA hazardous waste container storage area—**applicable**	40 *CFR* 264.178 *OAC* 3745-55-78
Closure of RCRA hazardous waste tanks	At closure, remove all hazardous waste and hazardous waste residues from tanks, discharge control equipment, and discharge confinement structures.	Management of RCRA hazardous waste in tanks—**applicable**	40 *CFR* 264.197(a) *OAC* 3745-55-97(A)
	If all contaminated contents cannot be removed, must consider the tank system a landfill and close the facility and perform post-closure care in accordance with the landfill closure requirements of 40 *CFR* 264.310 [*OAC* 3745-57-10].		40 *CFR* 264.197(b) *OAC* 3745-55-97(B)
	If a tank system does not have secondary containment, such a system is considered a landfill and closure and post-closure plans must reflect this.		40 *CFR* 264.197(c) *OAC* 3745-55-97(C)
Closure of a RCRA remediation waste staging pile	Must be closed by removing or decontaminating all remediation waste, contaminated containment system components, and structures and equipment contaminated with waste and leachate.	Storage of remediation waste in staging pile located in previously contaminated area—**applicable**	40 *CFR* 264.554(j)(1) *OAC* 3745-57-74(J)(1)
	Must decontaminate contaminated subsoils in a manner that will protect human health and the environment.		40 *CFR* 264.554(j)(2) *OAC* 3745-57-74(J)(2)
	Must be closed according to substantive requirements in 40 *CFR* 264.258(a) and 264.111 or 265.258(a) and 265.111 [*OAC* 3745-56-58(A) and 3745-55-11 or 3745-67-58 and 3745-66-11] by removing or decontaminating all waste residues, contaminated containment system components (liners, etc.), contaminated subsoils, and structures and equipment contaminated with waste and leachate, and managing them as hazardous waste.	Storage of remediation waste in staging pile located in an uncontaminated area—**applicable**	40 *CFR* 264.554(k) *OAC* 3745-57-74(K)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
	Transportation[c]		
Transportation of hazardous waste on site	The generator manifesting requirements of 40 *CFR* 262.20 to 262.32(b) [*OAC* 3745-52-20 to 3745-52-23 and 3745-52-32(B)] do not apply. Generator or transporter must comply with the requirements set forth in 40 *CFR* 263.30 and 263.31 [*OAC* 3745-53-30 and 3745-53-31] in the event of a discharge of hazardous waste on a private or public right-of-way.	Transportation of hazardous wastes on a public or private right of-way within or along the border of contiguous property under the control of the same person, even if such contiguous property is divided by a public or private right-of-way—**applicable**	40 *CFR* 262.20(f) *OAC* 3745-52-20(F)
Transportation of hazardous waste off site	Must comply with the generator requirements of 40 *CFR* 262.20 to 262.23 [*OAC* 3745-52-20 to 3745-52-23] for manifesting, Section 262.30 [*OAC* 3745-52-30] for packaging, Section 262.31 [*OAC* 3745-52-31] for labeling, Sect. 262.32 [*OAC* 3745-52-32] for marking, Section 262.33 [*OAC* 3745-52-33] for placarding, Sections 262.40 and 262.41(a) [*OAC* 3745-52-40 and 3745-52-41] for record keeping requirements, and Section 262.12 [*OAC* 3745-52-12] to obtain EPA ID number.	Preparation of RCRA hazardous waste for off-site transport—**applicable**	40 *CFR* 262.10(h) *OAC* 3745-52-10(H) 40 *CFR* 262.20 to .23 *OAC* 3745-52-20 to -23 40 *CFR* 262.30 to .33 *OAC* 3745-52-30 to -33
Transportation of hazardous materials on site	Must meet the substantive requirements of 49 *CFR* Parts 171–174, 177, and 178 or the site- or facility-specific Transportation Safety Document (i.e., *Transportation Safety Document for the On-Site Transfer of Hazardous Material at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* [LPP 2008]).	Transport of hazardous materials on the PORTS facility—**TBC**	DOE Order 460.1C(4)(b)

---

[c] As noted in the DFF&O, Paragraph 9.a, the NCP at 40 *CFR* 300.400(e)(1) defines “on-site” as meaning “the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for the implementation of the response action.” Off-site transportation, by definition, is not an on-site response action and is subject to all substantive, procedural, and administrative requirements of all legally applicable laws, but not to any requirements that might normally be labeled relevant and appropriate under the ARARs process.

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Transportation of hazardous materials off site	Any person who, under contract with a department or agency of the Federal government, transports "in commerce," or causes to be transported or shipped, a hazardous material, shall be subject to and must comply with all applicable provisions of the HMTA and HMR at 49 *CFR* 171 – 180 related to marking, labeling, placarding, etc.	Preparation for transport or shipment "in commerce" of a hazardous material—**applicable**	49 *CFR* 171.1(c)
SOLID WASTE			
	Design, construction, operation, and closure of a solid waste landfill		
Siting of a solid waste landfill	The limits of solid waste placement of the landfill cannot be:	Construction of a sanitary landfill (defined in *OAC* 3745-27-01 as including solid waste landfills)—**applicable**	*OAC* 3745-27-07(H)
	• Within 1,000 ft of or within a national park or recreation area or candidate area for potential inclusion in the national park system; or a state park or state park purchase area; or any property that lies within the boundaries of a national park or recreation area but that has not been acquired or is not administered by the secretary of the DOI (1,000-ft setback does not apply if obtain written authorization from the owner to locate within 1,000 ft)		*OAC* 3745-27-07(H)(1)
	• In a sand or gravel pit, or		*OAC* 3745-27-07(H)(2)(a)
	• In a limestone or sandstone quarry		*OAC* 3745-27-07(H)(2)(b)
	• Above a federally-designated sole source aquifer, unless granted an exemption by Ohio EPA		*OAC* 3745-27-07(H)(2)(c)
	• Above an unconsolidated aquifer system capable of sustaining a yield of 100 gpm for a 24-hr period to a well located within 1,000 ft of where solid waste is placed, unless deemed acceptable by Ohio EPA.		*OAC* 3745-27-07(H)(2)(d)
	The isolation distance between the uppermost aquifer system and the bottom of the recompacted soil liner of the landfill must be not less than 15 ft of in situ or added geologic material deemed acceptable by Ohio EPA.		*OAC* 3745-27-07(H)(2)(e)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Siting of a solid waste landfill (continued)	The limits of solid waste placement of the landfill and any leachate ponds or lagoons cannot be located within the surface and subsurface areas of either of the following:	Construction of a sanitary landfill (defined as including solid waste landfills)—**applicable**	*OAC* 3745-27-07(H)(3)(a)
	• Surrounding a public water supply well through which contaminants may move toward and may reach the well through underground geologic or man-made pathways within a period of 5 years		*OAC* 3745-27-07(H)(3)(a)(i)
	• A wellhead protection area or a drinking water source protection area for a public water system using groundwater		*OAC* 3745-27-07(H)(3)(a)(ii)
	Landfill cannot be located within an area of potential subsidence due to an underground mine or within the angle of draw of an underground mine unless the potential impact to the facility due to subsidence is minimized.		*OAC* 3745-27-07(H)(3)(b)
	The limits of solid waste placement of the landfill cannot be within 1,000 ft of a water supply well or a developed spring unless one or more of the conditions listed in *OAC* 3745-27-07(H)(3)(c)(i) – (iv) is met.		*OAC* 3745-27-07(H)(3)(c)
	Solid waste cannot be placed within 1,000 ft of the following natural areas:		*OAC* 3745-27-07(H)(4)(a)
	• National or state nature/wildlife refuge or preserve		
	• National or state wild, scenic or recreational river		
	• Special interest or research area, or		
	• Stream area designated by Ohio EPA as a coldwater or exceptional warm water habitat.		
	Solid waste cannot be placed:		*OAC* 3745-27-07(H)(4)
	• Within 300 ft of the landfill facility's property line, unless deemed acceptable by Ohio EPA		*OAC* 3745-27-07(H)(4)(b)
	• Within 1,000 ft of a residence whose owner has not consented in writing to its location		*OAC* 3745-27-07(H)(4)(c)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Siting of a solid waste landfill (continued)	• Within 200 ft of a stream, lake, or wetland		*OAC* 3745-27-07(H)(4)(d)
	• In a regulatory floodplain (as defined in *OAC* 3745-27-01) unless demonstrated that unit(s) will not restrict flow of the 100-yr flood, reduce the temporary water storage capacity of the floodplain, or result in washout of solid waste so as to pose a hazard to human health and the environment.	Construction of a sanitary landfill (defined as including solid waste landfills)—**applicable**	*OAC* 3745-27-20(C)(2)
	• Within 200 ft of a fault that has had displacement in Holocene time unless it is demonstrated that a distance of less than 200 ft will prevent damage to the structural integrity of the facility and will be protective of human health and the environment.		*OAC* 3745-27-20(C)(3)
	• In a “seismic impact zone” (as defined in *OAC* 3745-27-01) unless demonstrated that all containment structures, including liners, leachate collection systems, sedimentation ponds, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth material for the site.		*OAC* 3745-27-20(C)(4)
	• In an “unstable area” (as defined in *OAC* 3745-27-01) unless demonstrated that engineering measures have been incorporated into the design of the facility to ensure that the integrity of the structural components will not be disrupted.		*OAC* 3745-27-20(C)(5)
Design of a solid waste disposal facility	Detail engineering plans, specifications, and information for all unit(s) of a sanitary landfill facility shall be submitted, shown by means of drawings and narrative descriptions where appropriate. The information to be included on the drawings shall be as listed in *OAC* 3745-27-06(B)(2) through (7).	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-06(B) *OAC* 3745-27-06(B)(2) – (7)
	The following information shall be presented in narrative form in a report:		*OAC* 3745-27-06(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Design of a solid waste disposal facility (continued)	• Summary of the facility environs and a demonstration that the sanitary landfill facility will meet the siting criteria; shall include a discussion of the facility's compliance with the facility's limits of waste placement, the location restriction demonstrations, and operational criteria		*OAC* 3745-27-06(C)(1)
	• A hydrogeologic and geotechnical site investigation report(s), which shall at a minimum include the information listed in *OAC* 3745-27-06(C)(3)(a) through (g)	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-06(C)(3)
	• Analyses, as listed in *OAC* 3745-27-06(C)(4)(a) – (e) and (g), establishing stability of the facility and the subsurface.		*OAC* 3745-27-06(C)(4)(a) – (e) and (g)
	• Design calculations with references to equations used, showing site-specific input and assumptions that demonstrate compliance with the design requirements of *OAC* 3745-27-08		*OAC* 3745-27-06(C)(5)(a), (c) and (e) – (g), and (j) – (m)
	• For proposed new unit(s), the location restriction demonstrations in accordance with *OAC* 3745-27-20		*OAC* 3745-27-06(C)(6)
	• Demonstration of physical and chemical resistance, as required in *OAC* 3745-27-08(D)(10) and (D)(13), and compaction equipment slope limitations.		*OAC* 3745-27-06(C)(7)(b) and (c)
	• The QA/QC plan for the engineered components		*OAC* 3745-27-06(C)(9)(c)
	• Wetland demonstration to authorize discharge of dredge or fill material into wetlands, if facility will be sited in wetlands; and proof of property ownership or lease agreement to use the property as a sanitary landfill facility		*OAC* 3745-27-06(C)(10)(c) and (d)
Liner design criteria for a composite liner system	Composite liner system shall be designed to:	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(C)(1)
	• Serve as a barrier to prevent the discharge of any leachate to ground or surface waters.		*OAC* 3745-27-08(C)(1)(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Leachate collection and management system	• Have at least a 2.0% slope in all areas, except along flow lines augmented by leachate collection pipes, after accounting for 100% of the primary consolidation settlement and the secondary consolidation settlement of the compressible materials beneath the landfill which includes, as applicable, in-situ soil, added geologic material, structural fill material, and re-compacted soil liner.		*OAC* 3745-27-08(C)(1)(b)
	• Have a maximum slope based on the compaction equipment limitations and the slope stability		*OAC* 3745-27-08(C)(1)(e)
	The leachate collection and management system shall be designed to do the following:	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(C)(3)
	• Any components located outside of the limits of solid waste placement shall be no less protective of the environment than the sanitary landfill by complying with this paragraph.		*OAC* 3745-27-08(C)(3)(a)
	• The selection and specifications for the materials that will make up the leachate collection layer shall be protective of the flexible membrane liner or the design must include a liner cushion layer meeting the specifications for liner cushions at *OAC* 3745-27-08(D)(11).		*OAC* 3745-27-08(C)(3)(b) *OAC* 3745-27-08(D)(11)
	• Limit the level of leachate in areas other than sumps to a maximum of 1 ft throughout the operation and post closure of the landfill.		*OAC* 3745-27-08(C)(3)(c)
	• Have at least a 0.5% grade for the leachate collection pipes after accounting for 100% of the primary consolidation settlement and the secondary consolidation settlement of the compressible materials beneath the landfill which includes, as applicable, in-situ soil, added geologic material, structural fill material, and re-compacted soil liner.		*OAC* 3745-27-08(C)(3)(d)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Composite cap system for closure	Composite cap system shall be designed to do the following:	Closure of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(C)(4)
	• Minimize infiltration of surface water		*OAC* 3745-27-08(C)(4)(a)
	• Serve as a barrier to prevent leachate outbreaks		*OAC* 3745-27-08(C)(4)(b)
	• Have at least a 5.0% grade in all areas except where surface water control structures are located		*OAC* 3745-27-08(C)(4)(c)
	• Have a maximum slope based on compaction and maintenance equipment limitations and on slope stability		*OAC* 3745-27-08(C)(4)(d)
Design for explosive gas control system	The design of the explosive gas control system may utilize a passive venting system or an active extraction system to satisfy air pollution control requirements and shall be designed to maintain explosive gas concentrations below the explosive gas threshold limits in *OAC* 3745-27-12(E)(5)(a).	Construction of a sanitary waste landfill—**applicable** if landfill design includes an explosive gas control system	*OAC* 3745-27-08(C)(5)
Design for geosynthetic materials	The design of all geosynthetic materials specified in the engineered components, including but not limited to, flexible membrane liners, geosynthetic clay liners, and geosynthetic drainage nets, shall not rely on any of the tensile qualities of these geosynthetic components.	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(C)(6)
Design for engineered components and waste mass	The design for the stability of all engineered components and the waste mass shall address any configuration throughout the applicable developmental and post closure periods. Potential failures associated with internal, interim and final slopes, as these slopes are defined in *OAC* 3745-27-06, shall be used to define the minimum construction specification and materials that, at a minimum, will meet the requirements listed in *OAC* 3745-27-08(C)(7)(a) through (f).	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(C)(7)(a) through (f)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Run-on/runoff control structures	Surface water run-on and run-off control structures shall comply with the following: • Accommodate peak flow from 25-year/24-hour storm event • Minimize silting and scouring. • Use non-mechanical means for all permanent structures.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-08(D)(2)
Sedimentation ponds	Sedimentation ponds must comply with the standards in *OAC* 3745-27-08(D)(3)(a) through (e).	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-08(D)(3)
Groundwater control structures	Permanent ground water control structures shall adequately control ground water infiltration through the use of non-mechanical means such as impermeable barriers or permeable drainage structures. However, no permanent ground water control structures may be used to dewater an aquifer system, except if the recharge and discharge zone of the aquifer system are located entirely within the boundary of the sanitary landfill facility.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-08(D)(4)
Liner and leachate collection design for a composite liner system	The unconsolidated or consolidated stratigraphic units that make up the in-situ foundation shall meet the design standards listed in *OAC* 3745-27-08(D)(5)(a) through (f).	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-08(D)(5)
	Rock fills or soil fills for a structural berm or subbase shall comply with the design standards listed in *OAC* 3745-27-08(D)(6)(a) through (f).		*OAC* 3745-27-08(D)(6)
	Added geologic material shall comply with the design standards listed in *OAC* 3745-27-08(D)(7)(a) through (h).		*OAC* 3745-27-08(D)(7)
Liners	Recompacted soil liner shall comply with the design standards listed in *OAC* 3745-27-08(D)(8)(b) through (j).		*OAC* 3745-27-08(D)(8)
	A geosynthetic clay liner used in lieu of part of the recompacted soil liner or in lieu of the recompacted soil barrier layer, shall comply with the design standards listed in *OAC* 3745-27-08(D)(9)(a) through (d).		*OAC* 3745-27-08(D)(9)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Liner and leachate collection design for a composite liner system (continued) *Leachate collection layer*	A flexible membrane liner shall comply with the design standards listed in *OAC* 3745-27-08(D)(10)(a) through (f).		*OAC* 3745-27-08(D)(10)
	The liner cushion layer shall be placed above the flexible membrane liner and protect it from damage that may be caused by construction materials and activities and have pre-construction interface testing performed.		*OAC* 3745-27-08(D)(11)
	The leachate collection layer shall be placed above the composite liner system which may be protected by the cushion layer and shall comply with the standards in *OAC* 3745-27-08(D)(12)(a) and (b).		*OAC* 3745-27-08(D)(12)
	Leachate collection pipes shall comply with the design standards listed in *OAC* 3745-27-08(D)(13)(a) through (g).		*OAC* 3745-27-08(D)(13)
	The filter layer of the leachate collection and management system shall be placed above the leachate collection layer and leachate collection pipes and be designed to minimize clogging of the leachate collection layer, leachate collection pipes, and sumps.		*OAC* 3745-27-08(D)(14)
	Leachate collection and management system shall incorporate an adequate number of sumps that shall be protected from adverse effects from leachate and differential settling and be equipped with automatic high level alarms located no greater than 1 ft above the top elevation of sump.		*OAC* 3745-27-08(D)(15)
	Leachate collection and management system shall incorporate adequate measures that will automatically remove leachate from the landfill to leachate storage tank(s), a permitted discharge to a public sewer, or a permitted WWTU to facilitate the transfer of leachate from the storage tank(s) for the purpose of disposal.		*OAC* 3745-27-08(D)(16)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Liner and leachate collection design for a composite liner system (continued)	Any leachate conveyance apparatus located outside the limits of solid waste placement shall be monitored, be double cased with a witness zone, and be protected from the effects of freezing temperatures, crushing, or excess deflection.		*OAC* 3745-27-08(D)(16)(a) – (c)
Leachate storage tanks	Leachate storage tanks shall have adequate storage capacity to receive the anticipated amount of leachate removed during normal operations from the leachate sumps to maintain a maximum 1 ft of head and at a minimum have at least 1 week of storage capacity using design assumptions simulating final closure.		*OAC* 3745-27-08(D)(17)
	Any leachate storage tanks located outside of the limits of solid waste placement shall be monitored and include one of the following: • For leachate ASTs, be provided with spill containment no less than 110% of tank volume. • For leachate USTs, be double cased with a witness zone.		*OAC* 3745-27-08(D)(17)(a) and (b)
Support facilities for a sanitary landfill	All access roads used for waste hauling that are constructed within the horizontal limits of waste placement shall not have grades in excess of 12% and be designed to be stable and to prevent damage to the liner or cap systems caused by the effects of traffic loading and braking or any other action.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-08(D)(18)
Closure of a solid waste landfill with a composite cap system	Design and construction of a recompacted soil barrier layer in the composite cap system shall comply with *OAC* 3745-27-08(D)(21)(b) through (g) as follows:	Closure of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(D)(21)(a)
	• Be free of debris, foreign material, and deleterious material.		*OAC* 3745-27-08(D)(21)(b)
	• Not be comprised of solid waste.		*OAC* 3745-27-08(D)(21)(c)
	• Be placed above all areas of waste placement.		*OAC* 3745-27-08(D)(21)(d)
	• Not have any abrupt changes in grade that may result in damage to the geosynthetics		*OAC* 3745-27-08(D)(21)(e)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Closure of a solid waste landfill with a composite cap system (continued)	• Have pre-construction testing of the borrow soils performed on representative samples and the results submitted to Ohio EPA no later than 7 days prior to intended use of the material in construction of the cap soil barrier layer. Pre-construction testing shall determine the maximum dry density and optimum moisture content, grain size distribution, and recompacted laboratory permeability.		*OAC* 3745-27-08(D)(21)(f)
	• Be constructed in lifts to achieve uniform compaction, in accordance with the substantive requirements of *OAC* 3745-27-08(D)(21)(g)(i)(a) through (e), (ii), and (iii).		*OAC* 3745-27-08(D)(21)(g)
	• Be adequately protected from damage due to desiccation, freeze/thaw cycles, wet/dry cycles, and the intrusion of objects during construction of the cap system		*OAC* 3745-27-08(D)(21)(h)
	• Have QC control testing of the constructed lifts performed to determine the density and moisture content according to ASTM D2922-01 and ASTM D3017-01 (nuclear methods), ASTM D1556-00 (sand cone), ASTM D2167-94 (rubber balloon) or other methods acceptable to the director or his authorized representative at a frequency of no less than five tests per acre per lift. The locations of the individual tests shall be adequately spaced to represent the constructed area. Any penetrations shall be repaired using bentonite.		*OAC* 3745-27-08(D)(21)(i)
	If a geosynthetic clay liner is used in the composite cap system in accordance with paragraph (D)(21) of this rule, it shall be placed above an engineered subbase designed and constructed in accordance *OAC* 3745-27-08(D)(22).		*OAC* 3745-27-08(D)(22)
	A cap geosynthetic clay liner meeting the requirements of paragraph (D)(9) of this rule shall be placed above the engineered subgrade in the composite cap system.		*OAC* 3745-27-08(D)(23)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Closure of a solid waste landfill with a composite cap system (continued)	A cap flexible membrane liner meeting the requirements of paragraph (D)(10) of this rule shall be placed above the recompacted soil barrier layer or the geosynthetic clay liner in the composite cap system.		*OAC* 3745-27-08(D)(24)
	The cap drainage layer for the composite cap system shall comply with *OAC* 3745-27-08(D)(25).		*OAC* 3745-27-08(D)(25)
	For cap protection layers: a cap protection layer shall comply with *OAC* 3745-27-08(D)(26).		*OAC* 3745-27-08(D)(26)
Explosive gas control system design criteria	Explosive gas control system shall not compromise the integrity of the cap system, the leachate management system, or the composite liner system, and shall comply with the following:	Construction of a sanitary waste landfill—**applicable** if design includes explosive gas control system	*OAC* 3745-27-08(D)(27)
	• Accommodate waste settlement		*OAC* 3745-27-08(D)(27)(a)
	• Provide for the removal of condensate		*OAC* 3745-27-08(D)(27)(b)
	• Prevent lateral movement of explosive gas from the sanitary landfill facility		*OAC* 3745-27-08(D)(27)(c)
	• Prevent fires within the limits of solid waste placement		*OAC* 3745-27-08(D)(27)(d)
Liner design criteria for a recompacted soil liner	The construction of the recompacted soil liner shall be modeled by an approved test pad in accordance with *OAC* 3745-27-08(E).	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(E)
Pre-construction interface testing and reporting	The specific soils and representative samples of the geosynthetic materials that will be used at the site shall be tested, in accordance with the substantive requirements of *OAC* 3745-27-08(G), for interface shear strength over the entire range of normal stresses that will develop at the facility.	Construction of a sanitary waste landfill—**applicable**	*OAC* 3745-27-08(G)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Explosive gas migration monitoring	Shall prepare an explosive gas monitoring plan in compliance with the substantive requirements of *OAC* 3745-27-12(D) and (E).	Operation of a sanitary landfill**—relevant and appropriate** if calculated explosive gas emissions exceed calculated threshold limits of *OAC* 3745-27-12(E)(5)(a)	*OAC* 3745-27-12
	Shall implement explosive gas monitoring, sampling, and reporting, and appropriate contingency plans if required, in accordance with the approved monitoring plan and with the substantive requirements of *OAC* 3745-27-12(F) through (K).		
Post-closure restrictions	No person shall fill in, grade, excavate, build, drill, or mine on land where a hazardous or solid waste facility was operated without authorization from Ohio EPA.	Closure of a hazardous or solid waste disposal facility**—applicable**	*OAC* 3745-27-13(A), (C) and (H)
	If a person engages in filling, grading, excavating, building, drilling, or mining on land where a hazardous or solid waste facility was operated, must comply with the substantive best management provisions of *OAC* 3745-27-13.		*OAC* 3745-27-13
Activities causing release of pollutants, nuisances, or health hazards	Shall operate the facility in such a manner that operation does not create a nuisance or a health hazard or cause water pollution.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(B)(5)
Placement of waste in first layer ("select waste layer")	Shall place select waste as the first layer of waste in all areas within the limits of waste placement adjacent to or in contact with the leachate collection system to protect the composite liner from the intrusion of objects during operation of the facility. The select waste layer shall:	Operation of a sanitary landfill**—applicable**	*OAC* 3745-27-19(D)(1)
	• Not contain items over 2 ft in length that are capable of puncturing the liner.		*OAC* 3745-27-19(D)(1)(b)
	• Not restrict the flow of liquid to the leachate collection and management system.		*OAC* 3745-27-19(D)(1)(c)
	• Not contain fines or small particles which can clog the leachate collection system.		*OAC* 3745-27-19(D)(1)(d)
Site preparation	Shall clear naturally occurring vegetation to the extent necessary for proper operation of the facility	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(1)(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Site preparation (continued)	Any oil or gas wells within proposed limits of solid waste placement shall be properly plugged and abandoned in accordance with Chapter 1509 of the Revised Code.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(1)(b)
Facility maintenance and repair	Maintain integrity of the engineered components of the facility and repair any damage to or failure of the components.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(1)(c)
Chemical compatibility testing	Perform chemical compatibility testing if the director determines that such testing is necessary to demonstrate that the solid waste to be received at facility will not compromise the integrity of any material used to construct the facility.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(1)(d)
Support facilities for a sanitary landfill	Construct and maintain all-weather access roads within facility boundary in such a manner as to withstand the anticipated degree of use and allow passage of loaded refuse vehicles at all times, with minimum of erosion and dust generation.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(2)(a)
Security system for a sanitary landfill	Limit access to the facility by non-employees except during operating hours when operating personnel are present. Exclude live domestic and farm animals from the operating areas of the facility except for animals used for security purposes.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(2)(a), (b) and (d)
Content of contingency plan	Shall ensure that operable equipment of adequate size and quantity for facility operations are available at all times, or that an appropriate contingency plan is prepared to properly handle and dispose of waste materials in the event of equipment failure.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(3)(a),(b)
Inspections	Inspect facility at least daily for ponding, erosion, and leachate outbreaks and record results on daily log forms.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(E)(11)(a)
	Inspect sedimentation ponds and pond discharge structures, includes pipes, ditches, and culverts at least weekly for erosion, clogging, or failure and take prompt correction, if necessary and record results on daily log forms.		*OAC* 3745-27-19(E)(11)(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Run-on/runoff control systems	Ensure surface water is diverted from areas where solid waste is being, or has been, deposited. Ensure facility is designed, constructed, maintained, and provided with surface water control structures that control run-on and runoff of surface water. Structures shall ensure minimal erosion and infiltration of water through the cover material and cap system and shall be designed in accordance with *OAC* 3745-27-08. If ponding or erosion occurs where waste is being or has been deposited, shall undertake actions as necessary to correct conditions causing it. If substantial threat of surface water pollution exists, may be required to monitor the surface water.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(J)(1) – (4)
Leachate management at a solid waste landfill	If a leachate outbreak occurs at the facility, must repair all outbreaks and contain, properly manage, collect, and dispose of the leachate in accordance with *OAC* 3745-27-19(K)(5) and (K)(6) and take action to minimize, control, or eliminate the conditions which contribute to the production of leachate.	Construction and operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(K)(1)
	Maintain at least one lift station back-up pump at facility at all times.		*OAC* 3745-27-19(K)(2)
	Visually or physically inspect collection pipe network of leachate management system after placement of initial lift of waste to ensure that crushing has not occurred and inspect network annually thereafter to ensure that clogging has not occurred.		*OAC* 3745-27-19(K)(3)
	If approved, may temporarily store leachate within limits of waste placement until the leachate can be treated and disposed as outlined in the leachate contingency plan under *OAC* 3745-27-19(K)(6).		*OAC* 3745-27-19(K)(4)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Leachate management at a solid waste landfill (continued)	Treat and dispose of collected leachate in accordance with *ORC* Chapter 6111 and with one of the following: • Treat and dispose of collected leachate on site at the disposal facility • Pretreat collected leachate on site and dispose of off-site of facility • Treat and dispose of collected leachate off-site of facility	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(K)(5)
	Must plan for storage and disposal of leachate to address immediate and long-term steps, including the setting aside of land for the construction and operation of an on-site treatment facility, to be taken for leachate management in the event that leachate cannot be managed in accordance with *OAC* 3745-27-19(K)(5).	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(K)(6)
	If a substantial threat of water pollution exists from the leachate entering surface waters, the director or health commissioner may require the owner or operator to monitor the surface water.	Operation of a sanitary landfill—**applicable**	*OAC* 3745-27-19(K)(7)
	Solid waste disposal		
Disposal of solid wastes	Except as provided in paragraph (D) of *OAC* 3745-27-02, no person shall establish or modify a solid waste disposal facility without meeting the substantive criteria as follows:	Management and disposal of solid waste—**applicable**	*OAC* 3745-27-02(A)
	Disposal of solid wastes shall only be by the following methods or combination thereof:		*OAC* 3745-27-05(A)
	• Disposal at a licensed sanitary landfill facility		*OAC* 3745-27-05(A)(1)
	• Incinerating at a licensed incinerator		*OAC* 3745-27-05(A)(2)
	• Composting at a licensed composting facility		*OAC* 3745-27-05(A)(3)
	• Alternative disposal methods either as engineered fill or land application, provided use will not create a nuisance or harm human health or the environment and is capable of complying with other applicable laws.		*OAC* 3745-27-05(A)(4)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Prohibition on open dumping of solid wastes	Temporary storage of putrescible solid wastes in excess of 7 days, or temporary storage of any solid wastes where such storage causes a nuisance or health hazard shall be considered open dumping.	Temporary storage of solid waste prior to collection for disposal or transfer—**applicable**	*OAC* 3745-27-03(A)(2)
	No person shall conduct, permit, or allow open dumping. In the event that open dumping is or has occurred, person(s) responsible shall promptly remove and dispose or otherwise manage the solid waste and shall submit verification that the waste has been properly managed.	Management and disposal of solid waste—**applicable**	*OAC* 3745-27-05(C)
Disposal of whole or shredded scrap tires	Whole or shredded scrap tires cannot be disposed at a sanitary landfill with the exception of the following:		*OAC* 3745-27-19(E)(8)(g)
	• Burned or partially burned scrap tires, pyrolytic oil, and contaminated soils provided those materials meet the definition of solid waste in *OAC* 3745-27-01.		*OAC* 3745-27-19(E)(8)(g)(i)
	• Scrap tire pieces from a scrap tire recovery facility that are the byproduct of scrap tire processing.		*OAC* 3745-27-19(E)(8)(g)(ii)
	• Authorized beneficial uses of scrap tires pursuant to *OAC* 3745-27-78.		*OAC* 3745-27-19(E)(8)(g)(iii)
	• Whole scrap tires which could not be processed by a scrap tire recovery facility. The owner or operator of the scrap tire recovery facility shall complete a scrap tire shipping paper and record on the shipping paper why the scrap tires are not processable at the scrap tire recovery facility. This includes but is not limited to aircraft tires and forklift tires that are not processable due to their construction or scrap tires contaminated with mud or other materials that render the tires unsuitable for processing.		*OAC* 3745-27-19(E)(8)(g)(iv)

TSCA/PCB WASTES			
Design, construction, operation and closure of a TSCA chemical waste landfill			
Siting and liner design requirements for a TSCA landfill	Shall be located in thick, relatively impermeable formations such as large area clay pans. Where this is not possible, the soil shall have a high clay and silt content with the following parameters:	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(1)
	• In place soil thickness, 4 ft or compacted soil liner thickness, 3 ft		40 *CFR* 761.75(b)(1)(i)
	• Permeability (cm/sec), equal to or less than 1×10^{-7}		40 *CFR* 761.75(b)(1)(ii)
	• Percent soil passing No. 200 sieve > 30		40 *CFR* 761.75(b)(1)(iii)
	• Liquid limit, > 30		40 *CFR* 761.75(b)(1)(iv)
	• Plasticity index > 15.		40 *CFR* 761.75(b)(1)(v)
	Synthetic membrane liners shall be used when the hydrologic or geologic conditions at the landfill require such a liner in order to provide at least a permeability equivalent to that of the soils. A synthetic liner should be chemically compatible with PCBs.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(2)
	Adequate soil underlining and cover shall be provided to prevent excessive stress or rupture of the liner. The liner must have a minimum thickness of 30 mil.		
	The landfill must be located above the historical high groundwater table. The bottom of the landfill liner shall be at least 50 ft above the historical high water table. Floodplains, shorelands, and groundwater recharge areas shall be avoided. There shall be no hydraulic connection between the site and standing or flowing surface water.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(3)
	Shall provide diversion structures capable of diverting all surface water runoff from a 24-hour, 25-year storm.	Construction of a TSCA chemical waste landfill above the 100-year floodwater elevation—**applicable**	40 *CFR* 761.75(b)(4)(ii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Siting and liner design requirements for a TSCA landfill (continued)	The landfill site shall be located in an area of low to moderate relief to minimize erosion and to help prevent landslides or slumping.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(5)
	The landfill will not present an unreasonable risk of injury to health or the environment from PCBs when one or more of the requirements of 40 *CFR* 761.75(b) are not met, these requirements may be waived.		40 *CFR* 761.75(c)(4)
Monitoring at a TSCA chemical waste landfill	The groundwater and surface water from the disposal site area must be sampled prior to commencing operation for use as baseline data.	Operation of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(6)(i)(A)
Placement and construction of groundwater monitoring wells at a TSCA chemical waste landfill	If underlying earth materials are homogenous, impermeable, and uniformly sloping in one direction, only three sampling points shall be necessary. The points shall be equally spaced on a line through center of disposal area and extending from the area of highest water table elevation to the area of the lowest water table elevation.	Operation of TSCA chemical waste landfill groundwater monitoring program—**applicable**	40 *CFR* 761.75(b)(6)(ii)(A)
	All TSCA monitoring wells shall be cased and the annular space between the monitor zone (zone of saturation) and the surface shall be completely backfilled with Portland cement or an equivalent material and plugged with Portland cement to effectively prevent percolation of surface water into the well bore. The well opening at the surface shall have a removable cap to provide access and to prevent entrance of rainfall or stormwater runoff.	Construction of a TSCA groundwater monitoring well—**applicable**	40 *CFR* 761.75(b)(6)(ii)(B)
Groundwater monitoring at a TSCA chemical waste landfill	The groundwater monitoring well shall be pumped to remove the volume of liquid initially contained in the well before obtaining a sample for analysis.	Operation of TSCA groundwater monitoring wells—**applicable**	40 *CFR* 761.75(b)(6)(ii)(B)
Monitoring (surface or groundwater) at a TSCA chemical waste landfill	At a minimum, all samples shall be analyzed for PCBs, pH, specific conductance, and chlorinated organics. Sampling methods and analytical procedures for these parameters shall comply with those specified in 40 *CFR* 136 as amended in 41 FR 52779 on December 1, 1976.	Operation of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(6)(iii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Monitoring (surface or groundwater) at a TSCA chemical waste landfill (continued)	The discharge shall be treated to meet applicable State or Federal standards or recycled to the chemical waste landfill.		
Leachate collection system for TSCA landfill	A leachate collection monitoring system shall be installed above the chemical waste landfill. An acceptable system includes a compound leachate collection.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(7)
	Compound leachate collection system consists of a gravity flow drainfield installed above the waste disposal facility liner and above a secondary installed liner.		40 *CFR* 761.75(b)(7)(ii)
Leachate collection system monitoring and handling	Leachate collection systems shall be monitored monthly for quantity and physicochemical characteristics of leachate produced. The leachate should be either treated to acceptable limits for discharge in accordance with legally applicable discharge limits or disposed of by another legally appropriate method. Water analysis shall be conducted as provided in Paragraph (b)(6)(iii) of 40 *CFR* 761.75.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(7)
Inventory requirements	Disposal records shall include information on the PCB concentration in the liquid wastes and the three dimensional burial coordinates for PCBs and PCB Items.	Operation of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(8)(iv)
Security and support facilities for TSCA chemical waste landfill	A 6-ft woven mesh fence, wall, or similar device shall be placed around the site to prevent unauthorized persons and animals from entering.	Construction of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(9)(i)
	Roads shall be maintained to and within the site that are adequate to support the operation and maintenance of the site without causing safety or nuisance problems or hazardous conditions.		40 *CFR* 761.75(b)(9)(ii)
Operation of a TSCA chemical waste landfill	Site shall be operated and maintained to prevent hazardous conditions resulting from spilled liquids and windblown materials.	Operation of a TSCA chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(9)(iii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
	PCB waste generation, characterization, and segregation		
Torch-cutting of metal coated with paint that may contain PCBs	No person may openly burn PCBs. Combustion of PCBs by incineration as approved under Section 761.60 (a) or (e), or otherwise allowed under 40 *CFR* 761, is not open burning.	Management of PCB waste for storage or disposal—**applicable**	40 *CFR* 761.50(a)(1)
Management of PCB waste	Any person storing or disposing of PCB waste must do so in accordance with 40 *CFR* 761, Subpart D.	Storage or disposal of waste containing PCBs at concentrations ≥ 50 ppm—**applicable**	40 *CFR* 761.50(a)
	Any person cleaning up and disposing of PCBs shall do so based on the concentration at which the PCBs are found.	Cleanup or disposal of PCB remediation waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.61
Cleanup of new PCB spills	Spills shall be cleaned up in accordance with 40 *CFR* 761, Subpart G, "PCB Spill Cleanup Policy." This policy does not apply to existing spills (old spills which occurred prior to May 4, 1987).	Release into the environment of materials containing PCBs at ≥ 50 ppm, which occurs after May 4, 1987—**applicable**	40 *CFR* 761.125
	There may be exceptional spill situations that require less stringent cleanup or a different approach to cleanup because of factors associated with the particular spill. These factors may mitigate expected exposures and risks or make cleanup to these requirements impracticable.		40 *CFR* 761.120(a)(4)
Decontamination of PCB contaminated materials prior to use, reuse, distribution in commerce, or disposal as a non-TSCA waste	Chopping (including wire chopping), distilling, filtering, oil/water separation, spraying, soaking, wiping, stripping of insulation, scraping, scarification or the use of abrasives or solvents may be used to remove or separate PCBs to the decontamination standards for liquids, concrete, or nonporous surfaces, as listed in 40 *CFR* 761.79(b).	Generation of PCB wastes, including water, organic liquids, nonporous surfaces (scrap metal from disassembled electrical equipment), concrete, and nonporous surfaces covered with porous surfaces, such as paint or coating on metal—**applicable**	40 *CFR* 761.79(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Decontamination of water containing PCBs to levels acceptable for discharge	For water discharged to a treatment works or to navigable waters, decontaminate to < 3 µg/L (approximately < 3 ppb) or a PCB discharge limit included in a permit issued under Section 304(b) or 402 of the CWA; or	Discharge of water containing PCBs to a treatment works or navigable waters—**applicable**	40 *CFR* 761.79(b)(1)(ii)
Decontamination of water containing PCBs to levels acceptable for unrestricted use	Decontaminate to ≤ 0.5 µg/L (approximately ≤ 0.5 ppb) for unrestricted use.	Release of water containing PCBs for unrestricted use—**applicable**	40 *CFR* 761.79(b)(1)(iii)
Decontamination of organic liquids or nonaqueous inorganic liquids containing PCBs	For organic liquids or nonaqueous inorganic liquids containing PCBs, decontamination standard is < 2 mg/kg (i.e., < 2 ppm) PCBs.	Release of organic liquids or nonaqueous liquid containing PCBs—**applicable**	40 *CFR* 761.79(b)(2)
Decontamination of nonporous surfaces in contact with liquid PCBs to levels acceptable for unrestricted use	For nonporous surfaces previously in contact with liquid PCBs at any concentration, where no free-flowing liquids are currently present, ≤ 10 µg PCBs per 100 sq cm (≤ 10 µg/100 cm^2) as measured by a standard wipe test (40 *CFR* 761.123) at locations selected in accordance with Subpart P of 40 *CFR* 761.	Release of nonporous surfaces in contact with liquid PCBs at any concentration for unrestricted use—**applicable**	40 *CFR* 761.79(b)(3)(i)(A)
Decontamination of nonporous surfaces in contact with nonliquid PCBs to levels acceptable for unrestricted use	For nonporous surfaces in contact with nonliquid PCBs (including nonporous surfaces covered with a porous surface, such as paint or coating on metal), clean to Visual Standard No. 2, Near-White Blast Cleaned Surface Finish of the NACE. A person shall verify compliance with standard No. 2 by visually inspecting all cleaned areas.	Release of nonporous surfaces in contact with nonliquid PCBs for unrestricted use—**applicable**	40 *CFR* 761.79(b)(3)(i)(B)
Decontamination of nonporous surfaces in contact with liquid PCBs to levels acceptable for disposal in a TSCA smelter	For nonporous surfaces previously in contact with liquid PCBs at any concentration, where no free-flowing liquids are currently present, decontaminate to < 100 µg/100 cm^2 as measured by a standard wipe test (Section 761.123) at locations selected in accordance with Subpart P of 40 *CFR* 761.	Disposal of nonporous surfaces previously in contact with liquid PCBs at any concentration into a smelter operating in accordance with Section 761.72(b) —**applicable**	40 *CFR* 761.79(b)(3)(ii)(A)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Decontamination of nonporous surfaces in contact with nonliquid PCBs to levels acceptable for disposal in a TSCA smelter	For nonporous surfaces in contact with nonliquid PCBs (including nonporous surfaces covered with a porous surface, such as paint or coating on metal) clean to Visual Standard No. 3, Commercial Blast Cleaned Surface Finish, of the NACE. A person shall verify compliance with Standard No. 3 by visually inspecting all cleaned areas.	Disposal of nonporous surfaces in contact with nonliquid PCBs into a smelter operating in accordance with Section 761.72(b) — **applicable**	40 *CFR* 761.79(b)(3)(ii)(B)
Decontamination of concrete recently contaminated with PCBs	Decontamination standard for concrete is < 10 µg/100 cm^2 as measured by a standard wipe test (Section 761.123) if the decontamination procedure is commenced within 72 hours of the initial spill of PCBs to the concrete or portion thereof being decontaminated.	Decontamination of concrete within 72 hours of the initial spill of PCBs to the concrete—**applicable**	40 *CFR* 761.79(b)(4)
Disposal of materials previously contaminated with PCBs as non-TSCA waste	Materials from which PCBs have been removed by decontamination in accordance with 40 *CFR* 761.79, not including decontamination wastes and residuals under 40 *CFR* 761.79(g), are considered unregulated for disposal under Subpart D of TSCA (40 *CFR* 761).	Disposal of materials from which PCBs have been removed—**applicable**	40 *CFR* 761.79(a)(4)
Risk-based decontamination of PCB-containing materials	May decontaminate to an alternate risk-based decontamination standard under 40 *CFR* 761.79(h) if the standard does not pose an unreasonable risk of injury to health or the environment.	Decontamination of materials contaminated with PCBs – **applicable**	40 *CFR* 761.79(h)
Management of PCB/radioactive waste	Any person storing such waste ≥ 50 ppm PCBs must do so taking into account both its PCB concentration and radioactive properties, except as provided in 40 *CFR* 761.65(a)(1), (b)(1)(ii), and (c)(6)(i).	Generation of PCB/radioactive waste for disposal—**applicable**	40 *CFR* 761.50(b)(7)(i)
	Any person disposing of such waste must do so taking into account both its PCB concentration and its radioactive properties.		40 *CFR* 761.50(b)(7)(ii)
	If, after taking into account only the PCB properties in the waste, the waste meets the requirements for disposal in a facility permitted, licensed, or registered by a State as a municipal or nonmunicipal nonhazardous waste landfill, then the person may dispose of such waste without regard to the PCBs, based on its radioactive properties alone.		40 *CFR* 761.50(b)(7)(ii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
	PCB waste storage		
Temporary storage of PCB waste in a non-RCRA-regulated area	Except as provided in 40 *CFR* 761.65 (b)(2), (c)(1), (c)(7), (c)(9), and (c)(10), after July 1, 1978, facilities used for the storage of PCBs and PCB Items designated for disposal shall comply with the storage unit requirements in 40 *CFR* 761.65(b)(1).	Storage of PCBs and PCB items at concentrations ≥ 50 ppm for disposal—**applicable**	40 *CFR* 761.65(b)
	The facilities shall meet the following criteria:		40 *CFR* 761.65(b)(1)
	• Adequate roof and walls to prevent rain water from reaching the stored PCBs and PCB Items		40 *CFR* 761.65(b)(1)(i)
	• Adequate floor that has continuous curbing with a minimum 6-in.-high curb. Floor and curb must provide a containment volume equal to at least two times the internal volume of the largest PCB article or container or 25% of the internal volume of all articles or containers stored there, whichever is greater. *Note*: 6-in. minimum curbing not required for area storing PCB/radioactive waste		40 *CFR* 761.65(b)(1)(ii)
	• No drain valves, floor drains, expansion joints, sewer lines, or openings that permit liquids to flow from curbed area		40 *CFR* 761.65(b)(1)(iii)
	• Floors and curbing constructed of Portland cement, concrete, or a continuous, smooth, nonporous surface as defined at Section 761.3, which prevents or minimizes penetration of PCBs and		40 *CFR* 761.65(b)(1)(iv)
	• Not located at site below 100-year flood water elevation.		40 *CFR* 761.65(b)(1)(v)
Temporary storage of PCB waste in a RCRA-regulated area	Does not have to meet storage unit requirements in 40 *CFR* 761.65(b)(1) provided unit is stored in compliance with RCRA and PCB spills are cleaned up in accordance with Subpart G of 40 *CFR* 761.	Storage of PCBs and PCB items at concentrations ≥ 50 ppm for disposal—**applicable**	40 *CFR* 761.65(b)(2)(i) thru (iv)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Temporary storage of PCB waste in containers	Container(s) shall be marked as illustrated in 40 *CFR* 761.45(a).	Storage of PCBs and PCB Items at concentrations ≥ 50 ppm for disposal—**applicable**	40 *CFR* 761.40(a)(1)
	Storage area must be properly marked as required by 40 *CFR* 761.40(a)(10).		40 *CFR* 761.65(c)(3)
	Any leaking PCB Items and their contents shall be transferred immediately to a properly marked nonleaking container(s).		40 *CFR* 761.65(c)(5)
	Except as provided in 40 *CFR* 761.65(c)(6)(i) and (ii), container(s) shall be in accordance with requirements set forth in DOT HMR at 49 *CFR* 171-180.		40 *CFR* 761.65(c)(6)
	Items shall be dated when they are removed from service and the storage shall be managed so that PCB items can be located by this date. (Note: Date should be marked on the container.)	PCB Items (includes PCB wastes) removed from service for disposal—**applicable**	40 *CFR* 761.65(c)(8)
Temporary storage of PCB remediation waste or PCB bulk product waste in a TSCA waste pile	Waste must be placed and managed in accordance with the design and operation standards, including liner and cover requirements and runoff control systems, in 40 *CFR* 761.65(c)(9).	Storage of PCB remediation waste or PCB bulk product waste at cleanup site or site of generation—**applicable**	40 *CFR* 761.65(c)(9)(i)
	Requirements of 40 *CFR* 761.65(c)(9) of this part may be modified under the risk-based disposal option of Section 761.61(c).		40 *CFR* 761.65(c)(9)(iv)
Risk-based storage of PCB remediation waste or bulk product waste prior to disposal	May store in a manner other than prescribed in 40 *CFR* 761.65 if the method will not pose an unreasonable risk of injury to health or the environment.	Storage of PCB remediation waste or bulk product waste prior to disposal—**applicable**	40 *CFR* 761.61(c) 40 *CFR* 761.62(c)
Storage of PCB/radioactive waste in containers	For liquid wastes, containers must be nonleaking.	Storage of PCB/radioactive waste in containers other than those meeting DOT HMR performance standards—**applicable**	40 *CFR* 761.65(c)(6)(i)(A)
	For nonliquid wastes, containers must be designed to prevent buildup of liquids if such containers are stored in an area meeting the containment requirements of 40 *CFR* 761.65(b)(1)(ii); and		40 *CFR* 761.65(c)(6(i)(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Storage of PCB/radioactive waste in containers (continued)	For both liquid and nonliquid wastes, containers must meet all regulations and requirements pertaining to nuclear criticality safety.		40 *CFR* 761.65(c)(6)(i)(C)
Closure of TSCA storage facility	Must close in a manner that eliminates the potential for post-closure releases of PCBs which may present an unreasonable risk to human health or the environment.	Closure of a TSCA storage facility—**applicable**	40 *CFR* 761.65(e)(1)
	Must remove or decontaminate PCB waste residues and contaminated containment system components, equipment, structures, and soils during closure in accordance with levels specified in the PCB Spills Cleanup Policy in Subpart G of 40 *CFR* 761.		40 *CFR* 761.65(e)(1)(iv)
	A TSCA/RCRA storage facility closed under RCRA is exempt from the TSCA closure requirements of 40 *CFR* 761.65(e).	Closure of a TSCA/RCRA storage facility—**applicable**	40 *CFR* 761.65(e)(3)
PCB waste treatment/disposal			
Disposal of TSCA PCB waste in a chemical waste landfill	Must be placed in manner that will prevent damage to containers or articles. Other wastes that are not chemically compatible with PCBs shall be segregated from the PCBs throughout the handling and disposal process.	Disposal of PCBs or PCB Items in chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(8)(i)
	May be disposed of provided such waste is pretreated and/or stabilized (e.g., chemically fixed, evaporated, mixed with dry inert absorbent) to reduce its liquid content or increase its solid content so that a nonflowing consistency is achieved to eliminate the presence of free liquids prior to final disposal.	Disposal of PCB bulk liquids not exceeding 500 ppm—**applicable**	40 *CFR* 761.75(b)(8)(ii)
	May be disposed of if each container is surrounded by an amount of inert sorbent material capable of absorbing all of the liquid contents of the container.	Disposal of PCB container with liquid PCB between 50 and 500 ppm—**applicable**	40 *CFR* 761.75(b)(8)(ii)
	Ignitable wastes shall not be disposed of in chemical waste landfills.	Disposal of PCBs in a chemical waste landfill—**applicable**	40 *CFR* 761.75(b)(8)(iii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Performance-based disposal of PCB remediation waste	Shall be disposed according to 40 *CFR* 761.60(a) or (e), or decontaminated in accordance with 40 *CFR* 761.79.	Disposal of liquid PCB remediation waste—**applicable**	40 *CFR* 761.61(b)(1)
	May dispose by one of the following methods:	Disposal of nonliquid PCB remediation waste (as defined in 40 *CFR* 761.3)—**applicable**	40 *CFR* 761.61(b)(2)
	• In a high-temperature incinerator approved under 40 *CFR* 761.70(b) • By an alternate disposal method under 40 *CFR* 761.60(e) • In a chemical waste landfill under 40 *CFR* 761.75 • In a facility under 40 *CFR* 761.77, or		40 *CFR* 761.61(b)(2)(i)
	• Through decontamination in accordance with 40 *CFR* 761.79.		40 *CFR* 761.61(b)(2)(ii)
Risk-based disposal of PCB remediation waste	May dispose of in a manner other than prescribed in 40 *CFR* 761.61(a) or (b) if the method will not pose an unreasonable risk of injury to health or the environment.	Disposal of PCB remediation waste—**applicable**	40 *CFR* 761.61(c)
Disposal of PCB decontamination waste and residues	Shall be disposed at their existing PCB concentration unless otherwise specified in 40 *CFR* 761.79(g).	PCB decontamination waste and residues for disposal—**applicable**	40 *CFR* 761.79(g)
Disposal of PCB liquids (e.g., from drained electrical equipment)	Must be disposed of in an incinerator which complies with 40 *CFR* 761.70, except:	PCB liquids at concentrations ≥ 50 ppm—**applicable**	40 *CFR* 761.60(a)
	For mineral oil dielectric fluid, may be disposed in a high efficiency boiler according to 40 *CFR* 761.71(a).	PCB liquids at concentrations ≥ 50 ppm and < 500 ppm—**applicable**	40 *CFR* 761.60(a)(1)
	For liquids other than mineral oil dielectric fluid, may be disposed in a high efficiency boiler according to 40 *CFR* 761.71(b).		40 *CFR* 761.60(a)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of PCB-contaminated precipitation, condensation, or leachate	May be disposed in a chemical waste landfill which complies with 40 *CFR* 761.75 if:	PCB liquids at concentrations ≥ 50 ppm from incidental sources and associated with PCB Articles or nonliquid PCB wastes—**applicable**	40 *CFR* 761.60(a)(3)
	- Disposal does not violate 40 *CFR* 268.32(a) or 268.42(a)(1) and		40 *CFR* 761.60(a)(3)(i)
	- Liquids do not exceed 500 ppm and are not ignitable waste as described in 40 *CFR* 761.75(b)(8)(iii).		40 *CFR* 761.60(a)(3)(ii)
Disposal of PCB transformers	Shall be disposed of in one of the following:	Disposal of PCB transformers that contain PCBs at concentrations of ≥ 500 ppm in the contaminating fluid as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.60(b)(1)
	- An incinerator that complies with 40 *CFR* 761.70		40 *CFR* 761.60(b)(1)(i)(A)
	- A chemical waste landfill that is compliant with 40 *CFR* 761.75 provided all free-flowing liquid is removed from the transformer, the transformer is filled with a solvent, the transformer is allowed to stand for at least 18-continuous hours, and then the solvent is thoroughly removed.		40 *CFR* 761.60(b)(1)(i)(B)
Performance-based disposal of PCB bulk product waste	May dispose of by one of the following:	Disposal of PCB bulk product waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.62(a)
	- In an incinerator under 40 *CFR* 761.70		40 *CFR* 761.62(a)(1)
	- In a chemical waste landfill under 40 *CFR* 761.75		40 *CFR* 761.62(a)(2)
	- In a hazardous waste landfill under Section 3004 or Section 3006 of RCRA		40 *CFR* 761.62(a)(3)
	- Under alternate disposal under 40 *CFR* 761.60(e)		40 *CFR* 761.62(a)(4)
	- In accordance with decontamination provisions of 40 *CFR* 761.79		40 *CFR* 761.62(a)(5)
	- In accordance with the thermal decontamination provisions of 40 *CFR* 761.79(e)(6) for metal surfaces in contact with PCBs.		40 *CFR* 761.62(a)(6)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Risk-based disposal of PCB bulk product waste	May dispose of in a manner other than that prescribed in 40 *CFR* 761.62(a) if approved in writing by EPA and method will not pose an unreasonable risk of injury to health or the environment.	Disposal of PCB bulk product waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.62(c)
Disposal of PCB bulk product waste in solid waste landfill	May dispose of the following in a municipal or nonmunicipal nonhazardous waste landfill:	Disposal of nonliquid PCB bulk product waste listed in 40 *CFR* 761.62(b)(1)—**applicable**	40 *CFR* 761.62(b)(1)
	• Plastics (such as plastic insulation from wire or cable; radio, television and computer casings; vehicle parts; or furniture laminates); preformed or molded rubber parts and components; applied dried paints, varnishes, waxes or other similar coatings or sealants; caulking; Galbestos; nonliquid building demolition debris; or nonliquid PCB bulk product waste from the shredding of automobiles or household appliances from which PCB small capacitors have been removed (shredder fluff)		40 *CFR* 761.62(b)(1)(i)
	• Other PCB bulk product waste, sampled in accordance with the protocols set out in subpart R of 40 *CFR* Part 761 that leaches PCBs at < 10 µg/L of water measured using a procedure used to simulate leachate generation.		40 *CFR* 761.62(b)(1)(ii)
	May dispose of in a municipal or nonmunicipal nonhazardous waste landfill if:	PCB bulk product waste not meeting conditions of 40 *CFR* 761.62(b)(1) (e.g., paper/felt gaskets contaminated by liquid PCBs)—**applicable**	40 *CFR* 761.62(b)(2)
	• The PCB bulk product waste is segregated from organic liquids disposed of in the landfill and		40 *CFR* 761.62(b)(2)(i)
	• Leachate is collected from the landfill and monitored for PCBs.		40 *CFR* 761.62(b)(2)(ii)
Disposal of fluorescent light ballasts	Must be disposed of in a TSCA disposal facility as bulk product waste under 40 *CFR* 761.62 or in accordance with the decontamination provisions of 40 *CFR* 761.79.	Generation for disposal of fluorescent light ballasts containing PCBs in the potting material—**applicable**	40 *CFR* 761.60(b)(6)(iii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of PCB-contaminated electrical equipment (except capacitors)	Must remove all free-flowing liquid from the electrical equipment and dispose of the removed liquid in accordance with 40 *CFR* 761.60(a) and	Generation of PCB-contaminated electrical equipment (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(4)
	Dispose of by one of the following methods: • In a facility managed as a municipal solid waste or nonmunicipal nonhazardous waste facility • In an industrial furnace operating in compliance with 40 *CFR* 761.72, or • In a disposal facility under 40 *CFR* 761.60.	Drained PCB-contaminated electrical equipment including any residual liquids—**applicable**	40 *CFR* 761.60(b)(4)(i)
Disposal of PCB capacitor(s)	Any person must assume that a capacitor manufactured prior to July 2, 1979, whose PCB concentration is not established, contains ≥ 500 ppm PCBs. If the date of manufacture is unknown, any person must assume the capacitor contains ≥ 500 ppm PCBs.	Generation of PCB capacitors with ≥ 500 ppm PCBs for disposal—**applicable**	40 *CFR* 761.2(a)(4)
	Shall comply with all requirements of 40 *CFR* 761.60 unless it is known from label or nameplate information, manufacturer's literature, or chemical analysis that capacitor does not contain PCBs.		40 *CFR* 761.60(b)(2)(i)
	Shall dispose of in accordance with either of the following: • Disposal in an incinerator that complies with 40 *CFR* 761.70 • Disposal in a chemical waste landfill that complies with 40 *CFR* 761.75.	Generation of PCB capacitors with ≥ 500 ppm PCBs for disposal—**applicable**	40 *CFR* 761.60(b)(2)(iii)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Disposal of PCB capacitor(s) (continued)	Shall dispose of in one of the following disposal facilities approved under 40 *CFR* 761.60: • Incinerator under 40 *CFR* 761.70 • Chemical waste landfill under 40 *CFR* 761.75 • High efficiency boiler under 40 *CFR* 761.71 • Scrap metal recovery oven or smelter under 40 *CFR* 761.72	Disposal of large capacitors that contain ≥ 50 ppm but < 500 ppm PCBs—**applicable**	40 *CFR* 761.60(b)(4)(ii)
	May dispose of in municipal solid waste landfill.	Generation of PCB small capacitors (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(2)(ii)
Disposal of PCB-contaminated articles	Must remove all free-flowing liquid from the Article, disposing of the liquid in compliance with the requirements of 40 *CFR* 761.60(a)(2) or (a)(3) and	Generation of PCB-contaminated Articles (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(6)(ii)
	Dispose by one of the following methods: • In accordance with the decontamination provisions at 40 *CFR* 761.79 • In a facility managed as a municipal solid waste or nonmunicipal nonhazardous waste facility • In an industrial furnace operating in compliance with 40 *CFR* 761.72, or • In a disposal facility under 40 *CFR* 761.60.	Disposal of PCB-contaminated articles with no free-flowing liquid—**applicable**	40 *CFR* 761.60(b)(6)(ii)(A) thru (D)
Transportation of PCB wastes off site for disposal	Must comply with the manifesting provisions at 40 *CFR* 761.207 through 218.	Preparation for relinquishment of control over PCB wastes by transporting or offering for transport—**applicable**	40 *CFR* 761.207(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

RADIOACTIVE WASTE			
Design, construction, operation and closure of a low-level radioactive waste landfill			
Radiation protection of the public and the environment	Except as provided in 458.1(4)(c), exposure to individual members of the public from radiation shall not exceed a total EDE of 0.1 rem/year (100 mrem/year), an equivalent dose to the lens of the eye exceeding 1500 mrem/year, or an equivalent dose to the skin or extremities exceeding 5,000 mrem/year, exclusive of the dose contributions from background radiation, any medical administration the individual has received, or voluntary participation in medical/research programs.	Release of radionuclides to the environment from all sources of ionizing radiation and exposure pathways at a DOE facility that could contribute significantly to the total dose—**TBC**	DOE Order 458.1(4)(b) and (c)
	Shall use, to the extent practicable, procedures and engineering controls based on sound radiation protection principles to achieve doses to members of the public that are ALARA.		DOE Order 458.1(4)(d)
	Must not exceed 3 pCi/L annual average radon-220 and radon-222 concentration, not including background, at the site boundary if DOE activities release radon-220 and radon-222 or their decay products.	DOE activities that release radon-220 and radon-222 or their decay products—**TBC**	DOE Order 458.1(4)(f)(5)
	Except as provided in *OAC* 3701:1-38-13(C), exposure to individual members of the public from radiation shall not exceed 1 millisievert (0.1 rem) in a year, exclusive of the dose contributions from background radiation, any medical administration the individual has received, or voluntary participation in medical/research programs.	Licensee or registrant conducting operations that release radioactivity—**relevant and appropriate**	*OAC* 3701:1-38-13(A)(1)
	The dose in any unrestricted area from external sources, exclusive of the dose contribution from patients administered radioactive material and released in accordance with *OAC* 3701:1-58-30 or equivalent U.S. nuclear regulatory agency or agreement state regulations, shall not exceed 0.02 millisievert (0.002 rem) in any 1 hour.		*OAC* 3701:1-38-13(A)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Management, storage and disposal of LLW	Management, storage, and disposal must be conducted in a manner such that exposure to members of the public to radiation from radioactive waste complies with ALARA process requirements and does not exceed a TED of 25 mrem in a year from all exposure pathways and radiation sources associated with the waste, except for transportation and radon and its decay products.	Management, storage, and disposal of low-level radioactive waste—**TBC**	DOE Order 458.1(h)(1)(c)
Siting of a LLW disposal facility	Proposed locations for low-level waste facilities shall be evaluated considering environmental characteristics, geotechnical characteristics, and human activities, including whether it is located in a floodplain, a tectonically active area, or in a zone of water table fluctuation.	Construction of a LLW disposal facility—**TBC**	DOE M 435.1-1(IV)(M)(1)(a)(2)
	Proposed locations with environmental and geotechnical characteristics, and human activities for which adequate protection cannot be provided through the facility design shall be deemed unsuitable for location of the facility.		DOE M 435.1-1(IV)(M)(1)(b)
Siting, design, and operation of a DOE LLW disposal facility	LLW disposal facilities shall be sited, designed, operated, maintained, and closed so that a reasonable expectation exists that the following performance objectives will be met:	Siting, design, operation, maintenance, and closure of DOE LLW disposal facility—**TBC**	DOE M 435.1-1(IV)(P)(1)
	Dose to representative members of the public shall not exceed 25 mrem in a year total effective dose equivalent from all exposure pathways, excluding the dose from radon and its progeny in air.		DOE M 435.1-1(IV)(P)(1)(a)
	Dose to representative members of the public via air pathway shall not exceed 10 mrem in a year total EDE, excluding the dose from radon and its progeny.		DOE M 435.1-1(IV)(P)(1)(b)
	Release of radon shall be less than an average flux of 20 pCi/m2/s (0.74 Bq/m^2/s) at the surface of the disposal facility. Alternatively, a limit of 0.5 pCi/L (0.0185 Bq/L) of air may be applied at the boundary of the facility.	Operation of a LLW disposal facility at a DOE site—**TBC**	DOE M 435.1-1(IV)(P)(1)(c)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Siting, design, and operation of a DOE LLW disposal facility (continued)	Operating procedures must protect the public, workers, and the environment, ensure the security of the facility, minimize subsidence during and after waste placement, achieve long-term stability and minimize the need for long-term active maintenance, and meet the requirements of the closure/post-closure plan.		DOE M 435.1-1 (IV)(P)(6)(a)
	Permanent identification marks for disposal excavations and monitoring wells shall be emplaced.		DOE M 435.1-1 (IV)(P)(6)(b)
	Operations shall be conducted so that disposal operations do not have adverse effects on any other disposal unit low-level wastes.		DOE M 435.1-1 (IV)(P)(6)(d)
	Operations shall include a process for tracking and documenting low-level waste placement in the facility by generator source.		DOE M 435.1-1 (IV)(P)(6)(e)
Environmental monitoring at a LLW disposal facility	The environmental monitoring program shall be designed and operated to include measuring and evaluating releases, migration of radionuclides, disposal unit subsidence, and changes in disposal facility and disposal site parameters which may affect long term performance.	Operation of a LLW disposal facility at a DOE site—**TBC**	DOE M 435.1-1(IV)(R)(3)(b)
Control and stabilization of uranium-bearing wastes at a DOE site	Control and stabilization features shall be designed to: • Provide to the extent reasonably achievable an effective life of 1,000 years with a minimum of at least 200 years	Long-term management of uranium and its decay products—**TBC**	DOE Order 458.1(4)(h)(1)(d)(1)(a)
	• Limit radon-222 emanation to the atmosphere from the wastes to less than an annual average release rate of 20 pCi/m^2/s and prevent increase in the annual average radon-222 concentration at or above any location outside the boundary of the contaminated area by more than 0.5 pCi/L.		DOE Order 458.1(4)(h)(1)(d)(1)(b)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Facility requirements for land disposal of radioactive waste – performance objectives	Land disposal facilities shall be sited, designed, operated, closed, and controlled after closure to provide reasonable assurance that the following performance objectives will be met:	Siting, design, operation and closure of a licensed radioactive waste land disposal facility—**relevant and appropriate**	*OAC* 3701:1-54-08(B)
	• Concentrations of radioactive material which may be released to the general environment in ground water, surface water, air, soil, plants, or animals must not result in an annual dose exceeding the equivalent of 0.25 millisievert (25 millirem) to the whole body, 0.75 millisievert (75 millirem) to the thyroid, or 0.25 millisievert (25 millirem) to any other organ to any member of the public. Reasonable effort should be made to maintain releases of radioactivity in effluents to the general environment as low as is reasonably achievable.		*OAC* 3701:1-54-08(B)(1)
	• Disposal facility shall be sited, designed, used, operated, and closed to achieve long-term stability of the disposal site and to eliminate, to the extent practical, the need for ongoing active maintenance of the disposal site after closure so that only surveillance, monitoring, or minor custodial care are required.		*OAC* 3701:1-54-08(B)(4)
	• Shall develop and implement security measures to protect against and to detect unauthorized access to radioactive material or safety and security systems from external as well as internal threats. Shall perform periodic inspections to ensure all radioactive material is accounted for and that safety and security systems are operating as designed. Shall report any deficiency involving the radioactive material inventory or a safety and security system.		*OAC* 3701:1-54-08(B)(5)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Facility requirements for land disposal of radioactive waste – performance objectives (continued)	• Radioactive waste and its containers shall be protected from adverse environmental conditions including, but not limited to, temperature changes that could compromise the isolation of the waste from the biosphere.		*OAC* 3701:1-54-08(B)(6)
	• Shall use standard engineering designs and procedural practices to maintain doses to people, and radionuclide releases to environment, as low as reasonably achievable.		*OAC* 3701:1-54-08(B)(7)
Facility requirements for land disposal of radioactive waste – operational requirements	The operation of the disposal facility shall incorporate the following items:	Operation of a licensed radioactive waste land disposal facility—**relevant and appropriate**	*OAC* 3701:1-54-08(C)
	• Waste shall be packaged in appropriate containers for disposal when applicable. Wastes shall be emplaced in a manner that maintains the package integrity during emplacement, minimizes void spaces between packages, and permits the void spaces to be filled.		*OAC* 3701:1-54-08(C)(4)
	• Void spaces between packages shall be filled as needed to reduce future subsidence within the fill.		*OAC* 3701:1-54-08(C)(5)
	• Boundaries and locations of each disposal unit shall be accurately located and mapped by means of a land survey. Disposal units shall be marked in such a way that boundaries of each unit can be easily defined. Three permanent survey marker control points shall be established on the site to facilitate surveys.		*OAC* 3701:1-54-08(C)(7)
	• A buffer zone of land shall be maintained between any disposed waste and the disposal site boundary and beneath the disposed waste. Buffer zone shall be of adequate dimensions to carry out environmental monitoring activities specified in *OAC* 3701:1-54-09(E) and to take mitigative measures if needed.		*OAC* 3701:1-54-08(C)(8)
	• Closure and stabilization measures as set forth in the approved site closure plan shall be carried out as each disposal unit is filled and covered.		*OAC* 3701:1-54-08(C)(9)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Facility requirements for land disposal of radioactive waste – operational requirements (continued)	• Active waste disposal operations shall not have an adverse effect on completed closure and stabilization measures.		*OAC* 3701:1-54-08(C)(10)
Land disposal of radioactive waste – site selection, design, and environmental assessment	The primary emphasis in disposal site suitability is given to isolation of wastes and to disposal site features that ensure that the long-term performance objectives are met. Suitable disposal site features shall include:	Siting and design of a licensed radioactive waste land disposal facility—**relevant and appropriate**	*OAC* 3701:1-54-09(A)(1)
	• Shall be capable of being characterized, modeled, analyzed and monitored.		*OAC* 3701:1-54-09(A)(1)(a)
	• Areas shall be avoided having known natural resources that, if exploited, could result in failure to meet the performance objectives.		*OAC* 3701:1-54-09(A)(1)(c)
	• Site shall be generally well drained and free of areas of flooding or frequent ponding; shall not be located in a 100-year flood plain, coastal high-hazard area, or wetland, as defined in Federal Executive Order 11988, "Floodplain Management Guidelines," and shall be designed and constructed to be outside the 500-year floodplain.		*OAC* 3701:1-54-09(A)(1)(d)
	• Upstream drainage areas shall be minimized to decrease the amount of runoff that could erode or inundate waste disposal units.		*OAC* 3701:1-54-09(A)(1)(e)
	• Site shall provide sufficient depth to the water table that ground water intrusion, perennial or otherwise, into the waste will not occur.		*OAC* 3701:1-54-09(A)(1)(f)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Land disposal of radioactive waste – site selection, design, and environmental assessment (continued)	• The hydrogeologic unit used for disposal shall not discharge groundwater to the surface within the disposal site. The soil or rock layers immediately beneath the facility, but above the water table shall have good vertical drainage or be engineered to have good drainage to prevent water from ponding around the base of the facility. The shallowest hydrogeologic unit beneath the facility shall not discharge perennially to the site.		*OAC* 3701:1-54-09(A)(1)(g)
	• Areas shall be avoided where tectonic processes such as faulting, folding, seismic activity, or vulcanization may occur with such frequency and extent that it may significantly affect the ability of the disposal site to meet the performance objectives of this rule or may preclude defensible modeling and prediction of long-term impacts.		*OAC* 3701:1-54-09(A)(1)(h)
	• Areas should be avoided where surface geologic processes such as mass wasting, erosion, slumping, landsliding, or weathering occur with such frequency and extent that it may significantly affect the ability of the disposal site to meet the performance objectives of this rule, or may preclude defensible modeling and prediction of long-term impacts.		*OAC* 3701:1-54-09(A)(1)(i)
	• Site must not be located where nearby facilities or activities could affect the ability of the site to meet the performance objectives or mask the environmental monitoring program.		*OAC* 3701:1-54-09(A)(1)(j)
Radioactive generation, characterization, and segregation			
Characterization of LLW	Shall be characterized using direct or indirect methods and the characterization documented in sufficient detail to ensure safe management and compliance with the WAC of the receiving facility.	Generation of LLW for storage or disposal at a DOE facility—**TBC**	DOE M 435.1-1(IV)(I)
	Characterization data shall, at a minimum, include the following information relevant to the management of the waste:		DOE M 435.1-1(IV)(I)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Characterization of LLW (continued)	• Physical and chemical characteristics		DOE M 435.1-1(IV)(2)(a)
	• Volume, including the waste and any stabilization or absorbent media		DOE M 435.1-1(IV)(I)(2)(b)
	• Weight of the container and contents		DOE M 435.1-1(IV)(I)(2)(c)
	• Identities, activities, and concentrations of major radionuclides		DOE M 435.1-1(IV)(I)(2)(d)
	• Characterization date		DOE M 435.1-1(IV)(I)(2)(e)
	• Generating source		DOE M 435.1-1(IV)(I)(2)(f)
	• Any other information which may be needed to prepare and maintain the disposal facility performance assessment, or demonstrate compliance with performance objectives.		DOE M 435.1-1(IV)(I)(2)(g)
Decontamination of radioactively contaminated equipment and building structures	Property potentially containing residual radioactive material must not be released or cleared from DOE control unless it is either demonstrated not to contain residual radioactive material based on process and historical knowledge, radiological monitoring or surveys, or a combination of these; or the property is evaluated and appropriately monitored or surveyed in accordance with DOE Order 458.1(4)(k)(3)(b).	Residual radioactive material on equipment and building structures for unrestricted use—**TBC**	DOE Order 458.1(4)(k)(3)
Release of radiological materials or scrap metal for recycle or reuse	Before being released, property shall be monitored or surveyed to determine the types and quantities of residual radioactive material within the property; the quantities of removable and total residual radioactive material on property surfaces (including residual radioactive material on or under any coating); and that contamination within or on the property is in compliance with applicable DOE Authorized Limits of DOE Order 458.1(4)(k)(6).	Radionuclide-contaminated materials and equipment intended for recycle or reuse—**TBC**	DOE Order 458.1(4)(k)(3)(b)(1)–(2) and (4)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Release of radiological materials or scrap metal for recycle or reuse (continued)	Where potentially contaminated surfaces are difficult to access for measurement (as in some pipes, drains, and ductwork), such property may be released after case-by-case evaluation and documentation based on both the history of its use and available measurements sufficient to demonstrate that the unsurveyable surfaces are likely to meet DOE Authorized Limits.		DOE Order 458.1(4)(k)(3)(b)(3)
	Radioactive storage		
Preparation of solid LLW for storage	Shall be packaged in a manner that provides containment and protection for the duration of the anticipated storage period and until disposal is achieved or until waste has been removed from container.	Management and storage of LLW in containers at a DOE facility—**TBC**	DOE M 435.1-1 IV.L(1)(a)
	Vents or other measures shall be provided if the potential exists for pressurizing or generating flammable or explosive concentrations of gases within the waste container. Containers shall be marked such that their contents can be identified.		DOE M 435.1-1 IV.L(1)(b) and (c)
Temporary staging and storage of LLW	Ensure radioactive waste is stored in a manner that protects the public, workers, and the environment and that the integrity of waste storage is maintained for expected time of storage.	Management and storage of LLW at a DOE facility—**TBC**	DOE M 435.1-1 I.F(13) DOE M 435.1-1 IV.N(1)
	Shall not be readily capable of detonation, explosive decomposition, reaction at anticipated pressures and temperatures, or explosive reaction with water.		
	Shall be stored in a location and manner that protects the integrity of waste for the expected time of storage.		DOE M 435.1-1 IV.N(3)
	Shall be managed to identify and segregate LLW from mixed waste.		DOE M 435.1-1 IV.N(6)
	Staging of LLW shall be for the purpose of accumulation of such quantities of waste as necessary to facilitate transportation, treatment, and disposal.		DOE M 435.1-1 IV.N(7)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
	Radioactive waste treatment/disposal		
Treatment of LLW	Waste treatment to provide more stable waste forms and to improve the long-term performance of a LLW disposal facility shall be implemented as necessary to meet performance objectives of the disposal facility.	Generation of LLW for disposal at a DOE LLW facility—**TBC**	DOE M 435.1-1 IV.O
Treatment of uranium-bearing LLW	Such wastes shall be properly conditioned so that the generation and escape of biogenic gases will not cause the emission or dose limits in paragraph 4.h.(1) of DOE Order 458.1 to be exceeded and that biodegradation within the facility will not result in premature structural failure.	Placement of potentially biodegradable contaminated wastes in a long-term management facility—**TBC**	DOE Order 458.1(h)(1)(d)(3)
Disposal of LLW in a landfill	Waste placement into disposal units shall minimize voids between containers with the voids filled to the extent practicable. Uncontainerized bulk waste shall be placed to minimize voids and subsidence.	Operation of a LLW disposal facility at a DOE site—**TBC**	DOE M 435.1-1 (IV)(P)(6)(c)
	Void spaces within the waste and, if containers are used, between the waste and its container shall be reduced to the extent practical.		DOE M 435.1-1 (IV)(G)(1)(d)(1)
Land disposal of radioactive waste – waste classification and characteristics	The following waste characteristics are minimum requirements for all classes of waste and are intended to facilitate handling at the disposal site and provide protection of health and safety of personnel at the disposal site.	Land disposal of radioactive waste in a licensed radioactive waste landfill—**relevant and appropriate**	*OAC* 3701:1-54-10(B)
	Waste must not be packaged for disposal in cardboard or fiberboard boxes.		*OAC* 3701:1-54-10(B)(1)
	Liquid waste must be solidified or packaged in sufficient absorbent material to absorb twice the volume of the liquid.		*OAC* 3701:1-54-10(B)(2)
	Solid waste containing liquid shall contain as little free standing and noncorrosive liquid as is reasonably achievable, but in no case shall the liquid exceed 1% of the volume.		*OAC* 3701:1-54-10(B)(3)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action^a	Requirements^b	Prerequisite	Citation
Land disposal of radioactive waste – waste classification and characteristics (continued)	Waste must not be readily capable of detonation or of explosive decomposition or reaction at normal pressures and temperatures, or of explosive reaction with water.		*OAC* 3701:1-54-10(B)(4)
	Waste must not contain or be capable of generating quantities of toxic gases, vapors, or fumes harmful to persons transporting, handling, or disposing of the waste. This does not apply to radioactive gaseous waste packaged in accordance with paragraph (B)(7) of this rule.		*OAC* 3701:1-54-10(B)(5)
	Waste must not be pyrophoric. Pyrophoric materials contained in waste shall be treated, prepared, and packaged to be nonflammable.		*OAC* 3701:1-54-10(B)(6)
	The requirements in this rule are intended to provide stability of the waste. Stability is intended to ensure that the waste does not structurally degrade and affect overall stability of the site through slumping, collapse, or other failure of the disposal unit and thereby lead to water infiltration. Stability is also a factor in limiting exposure to an inadvertent intruder, since it provides a recognizable and nondispersible waste.		*OAC* 3701:1-54-10(B)(9)
	• Waste must have structural stability. A structurally stable waste form will generally maintain its physical dimensions and its form, under the expected disposal conditions such as weight of overburden and compaction equipment, presence of moisture, and microbial activity, and internal factors such as radiation effects and chemical changes. Structural stability can be provided by the waste form itself, processing the waste to a stable form, or placing the waste in a disposal container or structure that provides stability after disposal.		*OAC* 3701:1-54-10(B)(9)(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Land disposal of radioactive waste – waste classification and characteristics (continued)	• Notwithstanding provisions in *OAC* 3701:1-54-10 (B)(2) and (3), liquid wastes, or wastes containing liquid, must be converted into a form that contains as little free standing and noncorrosive liquid as is reasonably achievable, but in no case shall the liquid exceed 1% of the volume of the waste when the waste is in a disposal container designed to ensure stability, or 0.5% of the volume of the waste for waste processed to a stable form.		*OAC* 3701:1-54-10(B)(9)(b)
Disposal of solid LLW at DOE facilities	Shall meet waste acceptance requirements before it is transferred to the receiving facility.	Generation of LLW for disposal at a DOE facility—**TBC**	DOE M 435.1-1 (IV)(J)(2)
Transportation of radioactive waste off site for disposal	Shall be packed and transported in accordance with the substantive requirements of DOE Order 460.1C (*Packaging and Transportation Safety*) and DOE Order 460.2A (*Departmental Materials Transportation and Packaging Management*).	Preparation of shipment of radioactive waste—**TBC**	DOE M 435.1-1(I)(1)(E)(11)
	To the extent practicable, the volume of waste and number of shipments shall be minimized.		DOE M 435.1-1(III)(L)(2) DOE M 435.1-1(IV)(L)(2)
ASBESTOS-CONTAINING WASTE			
	Operation and closure of an asbestos-containing waste disposal site		
Operation of an active ACM waste disposal site	Shall cause or permit no visible emissions to the outside air; or shall comply with the requirements of *OAC* 3745-20-06(B) [as noted below].	Operation of an active waste disposal site that receives ACM—**applicable**	*OAC* 3745-20-06(A)
	Shall be no visible emissions to the outside air from ACM during the on-site transportation, transfer, deposition, or compacting operations.		*OAC* 3745-20-06(B)(1)
	Deposition and burial operations shall be conducted in a manner which prevents handling by equipment or persons that causes asbestos-containing waste materials to be broken up or dispersed before the materials are buried.		*OAC* 3745-20-06(B)(2)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Operation of an active ACM waste disposal site (continued)	As soon as practicable after deposition of the ACM but no later than at the end of each operating day, the ACM deposited during the operating day shall be covered with at least 12 in. of compacted nonasbestos-containing material. Alternatively, may apply for approval to utilize alternative control methods to bind dust, control wind erosion or convert asbestos to nonfriable forms.		*OAC* 3745-20-06(B)(3)
	During the unloading, deposition, burial, and initial compaction of ACM, must establish a restricted area adequate to deter the unauthorized entry of the general public and any unauthorized personnel from any location within 100 ft of the operations; and		*OAC* 3745-20-06(B)(4)
	Shall display a sign not less than 20 ×14 in. so that it is visible at all entrances and at intervals of 300 ft or less along the property line or the fencing immediately surrounding the restricted area using wording, letter sizes, and styles in accordance with specifications listed in *OAC* 3745-20-06(B)(5).		*OAC* 3745-20-06(B)(5)
Inventory requirements	Maintain until closure records of the location, depth and area, and quantity in cubic yards of asbestos-containing waste material within the disposal site on a map or diagram.	Operation of an active waste disposal site that receives ACM—**applicable**	40 *CFR* 61.154(f) *OAC* 3745-20-06(C)(2)
Closure of an asbestos-containing waste disposal site	Upon closure, meet the following requirements:	Closure of an active asbestos-containing waste disposal site—**applicable**	40 *CFR* 61.154(g) – (h) *OAC* 3745-20-06(E)
	• Either discharge no visible emissions to the outside air or		40 *CFR* 61.151(a)(1) *OAC* 3745-20-07(A)(1)
	• Cover the waste material with at least 15 cm (6 in.) of compacted nonasbestos-containing material and grow and maintain a vegetative cover on the area adequate to prevent exposure of ACM or		40 *CFR* 61.151(a)(2) *OAC* 3745-20-07(A)(2)
	• Cover the waste material with at least 60 cm (2 ft) of compacted nonasbestos-containing material, and maintain it to prevent exposure of the asbestos-containing waste		40 *CFR* 61.151(a)(3) *OAC* 3745-20-07(A)(3)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Closure of an asbestos-containing waste disposal site (continued)	• Unless a natural barrier adequately deters access by the general public, install and maintain warning signs and fencing as detailed in 40 *CFR* 61.151(b)(1) – (3)		40 *CFR* 61.151(b) *OAC* 3745-20-07(B)
	• Owner may use an alternative method of controlling the asbestos that has received prior approval of the Administrator rather than comply with the requirements of 40 *CFR* 61.151(a) or (b).		40 *CFR* 61.151(c) *OAC* 3745-20-07(C).
	NOTE: Approval would be granted through the DFF&O document approval process and included in the appropriate DFF&O document.		
	Asbestos-containing waste treatment and disposal		
Management of ACM prior to disposal	Discharge no visible emissions to the outside air, or use one of the emission control and waste treatment methods specified in Paragraphs (a)(1) through (a)(4) of 40 *CFR* 61.150 [Paragraphs (B)(1) through (B)(4) of *OAC* 3745-20-05].	Generation, collection, processing, packaging, and transporting of any ACM that is not Category I or II nonfriable ACM waste that did not become crumbled, pulverized, or reduced to powder [40 *CFR* 61.150(a)(5)]—**applicable**	40 *CFR* 61.150(a) *OAC* 3745-20-05(B)
Disposal of asbestos-containing waste material (e.g., transite siding, pipe lagging, insulation, ceiling tiles)	All asbestos-containing waste material must be adequately wetted, collected, sealed in leak-proof containers, and deposited as soon as practicable at an approved waste disposal site operated in accordance with Section 61.154 [*OAC* 3745-20-06] or a site that converts RACM and asbestos-containing waste material into nonasbestos (asbestos-free) material according to provisions of 40 *CFR* 61.155 [*OAC* 3745-20-13].	Removal and disposal of RACM, except Category I nonfriable asbestos-containing material**—applicable**	40 *CFR* 61.150(b)(1) - (2) *OAC* 3745-20-05(A)
	The requirements of 40 *CFR* 61.150(b)(1) and (2) [*OAC* 3745-20-05(A)] do not apply to Category I nonfriable ACM that is not RACM.		40 *CFR* 61.150(b)(3) *OAC* 3745-20-05(A)(4)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of asbestos-containing waste material (e.g., transite siding, pipe lagging, insulation, ceiling tiles) (continued)	May use an alternative emission control and waste treatment method that will control asbestos emissions equivalent to currently required methods, if the alternative method is suitable for the intended application, and the alternative method will not violate other regulations and will not result in increased water or land pollution or occupational hazards.		40 *CFR* 61.150(a)(4) *OAC* 3745-20-05(B)(4)
Transportation of asbestos-containing waste materials off site for disposal	For asbestos-containing waste material to be transported off the facility site, label containers or wrapped materials with the name of the waste generator and location at which the waste was generated.	Preparation of asbestos-containing waste materials for off-site transport—**applicable**	40 *CFR* 61.150(a)(1)(v) *OAC* 3745-20-05(C)(1)
	Mark vehicles used to transport asbestos-containing waste material during the loading and unloading of waste so that the signs are visible. The markings must conform to the requirements of 40 *CFR* 61.149(d)(1)(i), (ii), and (iii).		40 *CFR* 61.150(c) *OAC* 3745-20-05(E)
UNIVERSAL WASTES			
	Characterization and management		
Characterization and management of universal waste	Must manage universal waste in accordance with 40 *CFR* 273 [*OAC* 3745-273-33] in a way that prevents releases of any universal waste or component of a universal waste to the environment.	Generation of universal waste [as defined in 40 *CFR* 273 and *OAC* 3745-273] for disposal—**applicable**	40 *CFR* 273.33 *OAC* 3745-273-33(A)
	Must label or mark the universal waste to identify the type of universal waste.		40 *CFR* 273.34 *OAC* 3745-273-34
	May accumulate waste for no longer than 1 year from the date the waste is generated or received from another handler unless the requirements of 40 *CFR* 273.35(b) [*OAC* 3745-273-35(B)] are met.		40 *CFR* 273.35(a) *OAC* 3745-273-35(A)
	May accumulate universal waste for longer than 1 year from the date the waste is generated or received from another handler if such activity is solely for the purpose of accumulation of such quantities of universal waste as necessary to facilitate proper recovery, treatment, or disposal. However, the handler bears the burden of proving that such activity was solely for this purpose.		40 *CFR* 273.35(b) *OAC* 3745-273-35(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Characterization and management of universal waste (continued)	Shall ensure that all employees are thoroughly familiar with proper waste handling and emergency procedures relative to their responsibilities during normal facility operations and emergencies.		40 *CFR* 273.36 *OAC* 3745-273-36
	Must immediately contain all releases of universal wastes and other residues from universal wastes, and must determine whether any material resulting from the release is hazardous waste, and if so, must manage the hazardous waste in compliance with all applicable requirements.		40 *CFR* 273.37 *OAC* 3745-273-37
	Transportation		
Transportation of universal waste off site	Off-site shipments of universal waste by a large quantity handler of universal waste shall be made in accordance with 40 *CFR* 273.38 [*OAC* 3745-273-38].	Preparation of universal waste for off-site transport—**applicable**	40 *CFR* 273.38(c) *OAC* 3745-273-38(C)
	Must keep a record of each shipment of universal waste received and sent from the facility and retain record for at least 3 years. Record must include waste handler, shipper, or destination facility name and address, quantity and type of waste, and date shipment left or was received at facility.		40 *CFR* 273.39 *OAC* 3745-273.39
	Off-site shipments to a foreign destination must comply with requirements applicable to a primary exporter in *OAC* 3745-52-10, 3745-52-53, 3745-52-56 and 3745-52-57 and export waste only upon consent of the receiving country and in conformance with the EPA "Acknowledgement of Consent" as defined in *OAC* 3745-52-50 to 3745-52-57. A copy of the consent must be provided to the transporter.		40 *CFR* 273.40 *OAC* 3745-273.40

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Batteries			
Management of universal waste batteries	A large quantity handler of universal waste must contain any universal waste battery that shows evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions in a container. Container must be closed, structurally sound, compatible with the contents of the battery, and lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions.	Generation of universal waste batteries [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-02]—**applicable**	40 *CFR* 273.33(a)(1) *OAC* 3745-273-33(A)(1)
	Batteries, or container or tank in which the batteries are contained, must be labeled or marked clearly with any one of the following phrases: "Universal Waste – Battery(ies)" or "Waste Batter(ies)" or "Used Battery(ies)."		40 *CFR* 273.34(a) *OAC* 3745-273-34(A)
Pesticides			
Management of universal waste pesticides	A large quantity handler of universal waste pesticide must contain the pesticide in a container that remains closed, structurally sound, compatible with the pesticide, and that lacks evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions. A leaking pesticide container must be put into an overpack container, tank, or transport container, as detailed in 40 *CFR* 273.33(b) [*OAC* 3745-273-33(B)].	Generation of universal waste pesticides [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-03]—**applicable**	40 *CFR* 273.33(b) *OAC* 3745-273-33(B)(1) – (4)
	A container, tank, transport vehicle or vessel in which recalled or unused pesticides are contained must be labeled or marked clearly with the label that was on or accompanied the product and the word "Universal Waste – Pesticide(s)" or "Waste – Pesticide(s)."		40 *CFR* 273.34(b) and (c) *OAC* 3745-273-34(B) and (C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
	Thermostats and other mercury-containing equipment		
Management of universal waste thermostats or other mercury-containing equipment	A large quantity handler of universal waste must contain any mercury-containing equipment that shows evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions in a container. Container must be closed, structurally sound, compatible with the contents of the thermostat, and lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions, and be reasonably designed to prevent the escape of mercury into the environment by volatilization or any other means.	Generation of universal waste mercury-containing equipment [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-04]—**applicable**	40 *CFR* 273.33(c)(1) *OAC* 3745-273-33(C)(1)
	May remove the mercury-containing ampule or the open original housing holding the mercury from mercury-containing equipment and manage and dispose of it in accordance with regulations.		40 *CFR* 273.33(c)(2) – (4) *OAC* 3745-273-33(C)(2) – (4)
	Mercury-containing equipment or a container in which the equipment is contained must be labeled or marked clearly with any of the following phrases: “Universal Waste – Mercury-Containing Equipment” or Waste Mercury-Containing Equipment” or “Used Mercury-Containing Equipment.”		40 *CFR* 273.34(d)(1) *OAC* 3745-273-34(D)(1)
	Mercury-containing thermostats or containers containing only these thermostats must be labeled or marked clearly with any of the following phrases: “Universal Waste – Mercury Thermostat(s)” or “Waste Mercury Thermostat(s)” or “Used Mercury Thermostat(s).”		40 *CFR* 273.34(d)(2) *OAC* 3745-273-34(D)(2)
	Fluorescent and mercury vapor lamps		
Management of universal waste lamps (fluorescent, mercury vapor)	A large quantity handler of universal waste lamps must contain any lamp in containers or packages that are structurally sound, adequate to prevent breakage, and compatible with the contents of the lamps. Such containers and packages must remain closed and must lack evidence of leakage, spillage, or damage that could cause leakage of hazardous constituents under reasonably foreseeable conditions.	Generation of universal waste lamps [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-05]—**applicable**	40 *CFR* 273.33(d)(1) *OAC* 3745-273-33(D)(1)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Management of universal waste lamps (fluorescent, mercury vapor) (continued)	A large quantity handler of universal waste lamps must immediately clean up and place in a container any lamp that is broken and must place in a container any lamp that shows evidence of breakage, leakage, or damage that could cause the release of mercury or other hazardous constituents to the environment.		40 *CFR* 273.33(d)(2) *OAC* 3745-273-33(D)(2)
	Each lamp or container or package in which such lamps are contained must be labeled or marked clearly with one of the following phrases: “Universal Waste-Lamp(s),” or “Waste Lamps,” or “Used Lamps.”		40 *CFR* 273.34(e) *OAC* 3745-273-34(E)
	Mark or label the individual item with the date the lamp(s) became a waste, or mark or label the container or package with the date the wastes were received.		40 *CFR* 273.35(c) *OAC* 3745-273-35(C)
MISCELLANEOUS WASTES			
	State of Ohio Construction-Demolition Debris		
Exclusions for disposal or reuse of construction and demolition debris, or “clean hard fill” [as defined in *OAC* 3745-400-01(E)]	Construction and demolition debris facility requirements do not apply to construction and demolition debris or clean hard fill used in one or more of the following ways:	Use of construction and demolition debris or clean hard fill at a site**—applicable**	*OAC* 3745-400-03
	• Any construction site where construction debris and trees and brush removed in clearing the construction site are used as fill material on the site where the materials are generated or removed		*OAC* 3745-400-03(A)
	• Any site where clean hard fill is used, either alone or in conjunction with clean soil, sand, gravel, or other clean aggregates, in legitimate fill operations		*OAC* 3745-400-03(B)
	• Any site where debris is not disposed, such as where debris is reused or recycled in a beneficial manner, or stored for a temporary period remaining unchanged and retrievable.		*OAC* 3745-400-03(C)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Disposal of construction and demolition debris	Shall be disposed of only in an authorized construction and demolition debris facility or solid waste disposal facility; by means of open burning if permitted as provided in *OAC* 3745-19; or by other methods provided such methods are demonstrated to be capable of disposing without creating a nuisance or health hazard, without causing water pollution, and without violating any regulations under Chapters 3745, 3704 or 3734.	Disposal of construction and demolition debris—**applicable**	*OAC* 3745-400-04(A) and (B)
Disposal of construction and demolition debris as "clean hard fill"	Clean hard fill (does not include materials contaminated with hazardous, solid, or infectious waste) consisting of reinforced or nonreinforced concrete, asphalt concrete, brick (includes but is not limited to refractory brick and mortar), block, tile, or stone shall be managed in one or more of the following ways: • Recycled into usable construction material • Disposed in licensed construction and demolition debris or other waste facilities • Used in legitimate fill operations for construction purposes or to bring the site up to consistent grade, on the site of generation, or on a site other than the site of generation, pursuant to Paragraph (C) of *OAC* 3745-400-05.	Use of clean hard fill to bring a construction site up to consistent grade**—applicable**	*OAC* 3745-400-05(A)
	Clean hard fill may be stored for a period of less than 2 years. "Stored" means held in a manner remaining retrievable and substantially unchanged. Clean hard fill piled adjacent to a construction materials processing facility shall not be considered stored for more than 2 years if the pile is active, i.e., if clean hard fill material is added to and removed from the pile within a 2-year period.		*OAC* 3745-400-05(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
	Beryllium wastes		
Release of beryllium-contaminated equipment or other items	Must clean beryllium-contaminated equipment or other items to the lowest contamination level practicable, not to exceed the levels established in 10 *CFR* 850.31(b) and (c) and label them before release.	Release of beryllium-contaminated equipment or other items to general public or another DOE facility—**applicable**	10 *CFR* 850.31(a)
	Before being released to the general public or another DOE facility, ensure that the removable contamination level of equipment and item surfaces does not exceed the higher of 0.2 µg/100 cm^2 or the concentration level of beryllium in soil at the point or release, whichever is greater;		10 *CFR* 850.31(b)(1)
	Ensure equipment or item is labeled in accordance with 10 *CFR* 850.38(b); and		10 *CFR* 850.31(b)(2)
	Release is conditioned on the recipient’s commitment to implement controls that will prevent foreseeable beryllium exposure.		10 *CFR* 850.31(b)(3)
	Before being released to another facility performing work with beryllium, must ensure that removal contamination level of equipment and other item surfaces does not exceed 3 µg/100 cm^2;	Release of beryllium-contaminated equipment or other items to another facility performing work with beryllium—**applicable**	10 *CFR* 850.31(c)(1)
	Ensure equipment or item is labeled in accordance with 10 *CFR* 850.38(b); and		10 *CFR* 850.31(c)(2)
	Enclose or place in sealed, impermeable bags or containers to prevent the release of beryllium dust during handling or transportation.		10 *CFR* 850.31(c)(3)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	**Requirements**[b]	**Prerequisite**	**Citation**
Disposal of beryllium-containing waste or beryllium-contaminated equipment and other items	Must control the generation of beryllium-containing waste or beryllium-contaminated equipment and other items through the application of waste minimization principles.	Generation of beryllium-containing waste or beryllium-contaminated equipment and other items**—applicable**	10 *CFR* 850.32(a)
	Dispose of in sealed, impermeable bags, containers, or enclosures to prevent the release of beryllium dust during handling and transportation. Bags, containers, and enclosures must be labeled according to 10 *CFR* 850.38.		10 *CFR* 850.32(b)
Used oil			
Management of used oil	Used oil shall not be stored in a unit other than a tank, container, or RCRA regulated unit.	Generation and storage of used oil, as defined in 40 *CFR* 279.1 [*OAC* 3745-279-01(A)(12)], that meets the applicability requirements of 40 *CFR* 279.10—**applicable**	40 *CFR* 279.22(a) *OAC* 3745-279-22(A)
	Containers and aboveground tanks used to store used oil must be in good condition (no severe rusting, apparent structural defects, or deterioration); and not leaking (no visible leaks).		40 *CFR* 279.22(b)(1) and (2) *OAC* 3745-279-22(B)(1) and (2)
	Containers and aboveground tanks used to store used oil and fill pipes used to transfer used oil into USTs must be labeled or marked clearly with the words “Used Oil.”		40 *CFR* 279.22(c)(1) and (2) *OAC* 3745-279-22(C)(1)
	Upon detection of a release of used oil to the environment, a generator must stop the release; contain, clean up, and properly manage the released used oil; and, if necessary, repair or replace any leaking used oil storage containers or tanks prior to returning them to service.	Release of used oil to the environment—**applicable**	40 *CFR* 279.22(d) *OAC* 3745-279-22(D)
Disposal of hazardous used oil	Used oils that are identified as a hazardous waste and cannot be recycled in accordance with *OAC* 3745-279 must be managed in accordance with the hazardous waste management requirements of *OAC* 3745-50 to 3745-69, 3745-205, 3745-256, 3745-266, and 3745-270.	Generation of used oil—**applicable**	40 *CFR* 279.81(a) *OAC* 3745-279-81(A)
Disposal of nonhazardous used oils	Used oils that are not hazardous wastes and cannot be recycled under *OAC* 3745-279 must be disposed in accordance with the applicable requirements of *OAC* 3745-27, 3745-28, 3745-29, and 3745-30.		40 *CFR* 279.81(b) *OAC* 3745-279-81(B)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Transportation of used oil off site	Except as provided in paragraphs (a) to (c) of 40 *CFR* 279.24 [*OAC* 3745-279-24(A) to (C)], generators must ensure that their used oil is transported by transporters who have obtained EPA ID numbers.	Preparation of used oil for off-site transport—**applicable**	40 *CFR* 279.24 *OAC* 3745-279-24
Refrigeration equipment			
Disposal of refrigeration equipment	With the exception of the substitutes in the end uses listed in 40 *CFR* 82.154(a)(1)(i) – (vi), no person maintaining, servicing, repairing, or disposing of appliances may knowingly vent or otherwise release into the environment any refrigerant or substitute from such appliances.	Appliances that contain Class I or II substances used as a refrigerant—**applicable**	40 *CFR* 82.154(a)(1)
Disposal of refrigeration equipment (continued)	*De minimis* releases associated with good faith attempts to recycle or recover refrigerants are not subject to this prohibition.		40 *CFR* 82.154(a)(2)
	No person may dispose of such appliances, except for small appliances, MVACs, and MVAC-like appliances, without: • Observing the required practices set forth in 40 *CFR* 82.156 and • Using equipment that is certified for that type of appliance pursuant to 40 *CFR* 82.158.		40 *CFR* 82.154(b)
WATER DISCHARGES			
Water treatment and discharges (e.g., leachate, stormwater, decon water)			
Activities causing storm water runoff	Dischargers must utilize best management practices to control pollutants in storm water discharges during and after construction, which may include, as appropriate, soil stabilization practices (e.g., seeding); perimeter structural practices (e.g., gabions, silt fences, sediment traps); and storm water management devices as detailed in Part III.G.2 (“Controls”) of NPDES OHC000003.	Storm water runoff discharges from land disturbed by construction activity—disturbance of ≥ 1 acre total, except where otherwise exempt as specified in 40 *CFR* 122.26(b)(15)—**applicable**	Authorization for Storm Water Discharges Associated with Construction Activity under NPDES OHC000003, Part III.G.2

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Release of wastewater from a new hazardous waste landfill through a new point source	Except as provided in 40 *CFR* 445.1, discharges of wastewater from a new RCRA hazardous waste landfill must comply with the performance standards for new sources, which are the same as the maximum daily and maximum monthly average effluent limitations listed in 40 *CFR* 445.11.	Release of water from a new hazardous waste landfill through a new discharge point source—**applicable**	40 *CFR* 445.14
Disposal of wastewaters containing RCRA hazardous constituents in a CWA WWTU	Disposal is not prohibited if the wastes are managed in a treatment system which subsequently discharges to waters of the U.S. under the CWA unless the wastes are subject to a specified method of treatment other than DEACT in 40 *CFR* 268.40 (*OAC* 3745-270-40) or are D003 reactive cyanide.	Disposal of RCRA restricted hazardous wastes that are hazardous only because they exhibit a hazardous characteristic and are not otherwise prohibited under 40 *CFR* Part 268—**applicable**	40 *CFR* 268.1(c)(4)(i) *OAC* 3745-01(C)(4)
General duty to mitigate for discharge of wastewater from water treatment system	Take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of effluent standards which has a reasonable likelihood of adversely affecting human health or the environment.	Discharge of pollutants to surface waters—**applicable**	40 *CFR* 122.41(d) *ORC* 6111.04(C)
Operation and maintenance of treatment system	Properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) installed or used to achieve compliance with the effluent standards. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures.	Discharge of pollutants to surface waters—**applicable**	40 *CFR* 122.41(e) *OAC* 3745-33-08(A)(8)
Criteria for discharge of wastewater with radionuclides into surface water	Except for tritium and sanitary sewers, apply BAT if at the point of discharge: • The annual average concentration of a given radionuclide is greater than the DCS value for water or, for multiple radionuclides, the composite DCS must be the sum of the fractional DCS values derived from DOE-approved DCS values.	Discharge or release of liquids containing radionuclides from DOE activities—**TBC**	DOE Order 458.1(g)(5)(a)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Criteria for discharge of wastewater with radionuclides into surface water (continued)	• The discharge contributes greater than 10 mrem (0.1 mSv) annual TED to members of the public or		DOE Order 458.1(g)(5)(b)
	• The collective dose from all DOE sources is greater than 100 person-rem (1 person-Sv) and the liquid discharge contributes 50% or more of this collective dose.		DOE Order 458.1(g)(5)(c)
	Conduct activities to ensure that liquid discharges containing radionuclides from DOE activities do not exceed an average (at the point of discharge) of either of the following: • 5 pCi (0.2 Bq) per gram above background level of settleable solids for alpha-emitting radionuclides or • 50 pCi (2 Bq) per gram above background level of settleable solids for beta-emitting radionuclides.	Release of liquids containing radionuclides from DOE activities—**TBC**	DOE Order 458.1(g)(4)
	Ensure that liquid releases are managed in a manner that protects ground water resources now and in the future, based on use and value considerations.		DOE Order 458.1(g)(3)
	Ensure that radionuclides contained in liquid effluents do not cause private or public drinking water systems to exceed the drinking water MCLs in 40 *CFR* 141.		DOE Order 458.1(g)(7)
Technology-based treatment requirements for wastewater discharge	To the extent that EPA promulgated effluent limitations are inapplicable, shall develop on a case-by-case BPJ basis under §402(a)(1)(B) of the CWA, technology based effluent limitations by applying the factors listed in 40 *CFR* §125.3(d) and shall consider: • The appropriate technology for this category or class of point sources, based upon all available information; and • Any unique factors relating to the discharger.	Discharge of pollutants to surface waters from other than a POTW—**applicable**	40 *CFR* 125.3(c)(2) *ORC* 6111.042

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Water quality-based effluent limits for wastewater discharge	Must develop water quality based effluent limits that ensure that: • The level of water quality to be achieved by limits on point source(s) established under this paragraph is derived from, and complies with all applicable water quality standards and • Effluent limits developed to protect narrative or numeric water quality criteria are consistent with the assumptions and any available waste load allocation for the discharge prepared by the State and approved by EPA pursuant to 40 *CFR* §130.7.	Discharge of pollutants to surface waters that causes, or has reasonable potential to cause, or contributes to an instream excursion above a narrative or numeric criteria within a State water quality standard established under §303 of the CWA—**applicable**	40 *CFR* 122.44(d)(1)(vii) *OAC* 3745-33-05(A)(1)
	Must attain or maintain a specified water quality through water quality related effluent limits established under §302 of the CWA.		40 *CFR* 122.44(d)(2)
	No entity shall cause pollution or place or cause to be placed any sewage, sludge, sludge materials, industrial waste, or other wastes in a location where they cause pollution of any waters of the state.		*ORC* 6111.04
	No person shall violate or fail to perform any duty imposed by sections 6111.01 to 6111.08 of the Revised Code or violate any order, rule, or term or condition of a permit issued or adopted by the director of environmental protection pursuant to those sections.		*ORC* 6111.07
	Stream use designations are given for Little Beaver Creek drainage basin and Scioto River drainage basin and *OAC* 3745-1-07 is referenced for applicable water quality standards.		*OAC* 3745-1-09 *OAC* 3745-1-15
	OAC 3745-1-07 provides allowable instream concentrations of pollutants that may be found in surface waters or discharged into surface waters, depending on use designation, and are applied as "outside mixing zone" or "inside mixing zone maximum" averages.		*OAC* 3745-1-07

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Water quality-based effluent limits for wastewater discharge (continued)	The general water quality criteria listed in *OAC* 3745-1-04 (which address suspended solids, floating debris, oil, scum, color, odor, toxic substances, nuisance growth of algae and weeds, and sewage) apply to all surface waters of the state including mixing zones.		*OAC* 3745-1-04
Monitoring requirements for water treatment system discharges	In addition to 40 *CFR* §122.48(a) and (b) and to assure compliance with effluent limitations, one must monitor, as provided in subsections (i) thru (iv) of §122.44(i)(1).	Discharge of pollutants to surface waters—**applicable**	40 *CFR* 122.44(i)(1) *OAC* 3745-33-08(A)(6)
	NOTE: Monitoring parameters, including frequency of sampling, will be developed as part of the DFF&O process and included in a Remedial Design, RAWP, or other appropriate DFF&O document.		
	All effluent limitations, standards and prohibitions shall be established for each outfall or discharge point, except as provided under §122.44(k).		40 *CFR* 122.45(a) *OAC* 3745-33-06(A)
	All effluent limitations, standards and prohibitions, including those necessary to achieve water quality standards, shall unless impracticable be stated as maximum daily and average monthly discharge limitations for all discharges.	Continuous discharge of pollutants to surface waters—**applicable**	40 *CFR* 122.45(d)(1)
AIR EMISSIONS			
	Fugitive air emissions		
Activities causing fugitive dust (particulate) emissions	Shall take reasonable achievable control measures to prevent particulate matter from becoming airborne. Reasonable achievable control measures shall include, but are not limited to, the following:	Fugitive emissions from transportation, land-disturbing, or building alteration activities located in areas identified in Appendix A to *OAC* 3745-17-08, except as exempted under *OAC* 3745-17-08(A)(3)—**relevant and appropriate**	*OAC* 3745-17-08(B)
	• Use, where possible, of water or chemicals for control of dust and in demolition of existing buildings or structures, construction operations, grading of roads, or the clearing of land		*OAC* 3745-17-08(B)(1)

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Activities causing fugitive dust (particulate) emissions (continued)	• Periodic application of asphalt, oil (excluding used oil), water, or other suitable chemicals on dirt or gravel roads and parking lots, materials stock piles, and other surfaces which can create airborne dusts, or the use of canvas or other suitable coverings for all materials stockpiles and stockpiling operations except temporary stockpiles		*OAC* 3745-17-08(B)(2) and (6)
	• Install and use hoods, fans, and other equipment to adequately enclose, contain, capture, vent, and control fugitive dust at the point of capture to extent possible with good engineering design. Equipment must meet efficiency requirements of *OAC* 3745-17-08(B)(3)(a) and (b).		*OAC* 3745-17-08(B)(3)
	• Use of adequate containment methods during sandblasting or similar operations		*OAC* 3745-17-08(B)(5)
	• Cover, at all times, open-bodied vehicles when transporting materials likely to become airborne		*OAC* 3745-17-08(B)(7)
	• Pave and maintain roadways in a clean condition		*OAC* 3745-17-08(B)(8)
	• Promptly remove, in such a manner as to minimize or prevent resuspension, earth or other material from paved streets onto which this material has been deposited by trucking or earth moving equipment or erosion by water or other means.		*OAC* 3745-17-08(B)(9)
	Air emissions from a stationary source		
Activities causing release of air pollutants	Shall not cause the emission or escape into the open air from any source or sources whatsoever, of smoke, ashes, dust, dirt, grime, acids, fumes, gases, vapors, odors, or any other substances or combinations of substances, in such manner or in such amounts as to endanger the health, safety, or welfare of the public, or cause unreasonable injury or damage to property.	Activities causing the release of air pollution nuisances as defined in *OAC* 3745-15-07(A)—**applicable**	*OAC* 3745-15-07

Table F.1. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project On-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Media/Location/Action[a]	Requirements[b]	Prerequisite	Citation
Activities causing radionuclide air emissions	Emissions of radionuclides to the ambient air from DOE facilities shall not exceed those amounts that would cause any member of the public to receive an EDE of 10 mrem per year.	Radionuclide air emissions from DOE facilities—**applicable**	40 *CFR* 61.92
Air emissions from process vents in treatment of VOC contaminated water	Except as provided in paragraphs (C), (D) and (H) of *OAC* 3745-15-05 and division (B) of section 3704.011 of the Revised Code, any air contaminant source is exempt from Chapter 3704 of the Revised Code and rules adopted thereunder, unless the potential emissions of any one of the following exceeds 10 lb/day: particulate matter, sulfur dioxide, nitrogen oxides, organic compounds, carbon monoxide, lead or any other air contaminant.	Air emissions from an air contaminant source—**applicable**	*OAC* 3745-15-05(B)

ACM = asbestos-containing material
ALARA = as low as reasonably achievable
ARAR = applicable or relevant and appropriate requirement
AST = aboveground storage tank
ASTM = American Society for Testing and Materials
BAT = best available technology
BPJ = best professional judgment
CAMU = corrective action management unit
CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act of 1980
CFR = Code of Federal Regulations
CMBST = combustion
COE = Corps of Engineers
CQA = Construction Quality Assurance
CWA = Clean Water Act
DCS = Derived Concentration Technical Standard
DEACT = deactivation
DFF&O = *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto*
DOE = U.S. Department of Energy
DOE M = U.S. Department of Energy Radioactive Waste Management Manual
DOI = U.S. Department of Interior
DOT = U.S. Department of Transportation
EDE = effective dose equivalent
EPA = U.S. Environmental Protection Agency
FR = Federal Register
HMR = Hazardous Materials Regulations
HMTA = Hazardous Materials Transportation Act of 1975 (Amendments of 1976)
ID = identification number
LDR = land disposal restriction
LPP = LATA/Parallax Portsmouth, LLC
LLW = low-level (radioactive) waste
MCL = maximum contaminant level
MVAC = motor vehicle air conditioning
NACE = National Association of Corrosion Engineers
NCP = National Oil and Hazardous Substances Pollution Contingency Plan
NPDES = National Pollutant Discharge Elimination System
OAC = Ohio Administrative Code
Ohio EPA = Ohio Environmental Protection Agency
ORC = Ohio Revised Code
PCB = polychlorinated biphenyl
POLYM = polymerization
PORTS = Portsmouth Gaseous Diffusion Plant
POTW = publicly owned treatment works
QA = quality assurance
QC = quality control
RACM = regulated asbestos-containing material
RAWP = remedial action work plan
RCRA = Resource Conservation and Recovery Act of 1976, as amended
RORGS = recovery of organics
TBC = to-be-considered
TED = total effective dose
TSCA = Toxic Substances Control Act of 1976
TSD = treatment, storage, and disposal
TU = temporary unit
USC = United States Code
UST = underground storage tank
UTS = universal treatment standard
VOC = volatile organic compound
WAC = waste acceptance criteria
WWTU = wastewater treatment unit

Action	Requirements[a]	Prerequisite	Citation
HAZARDOUS WASTE			
	Waste generation, characterization, and segregation		
Characterization of solid waste	Must determine if solid waste is hazardous or is excluded under 40 *CFR* 261.4 [*OAC* 3745 51-04]; and	Generation of solid waste as defined in 40 *CFR* 261.2—**applicable**	40 *CFR* 262.11(a) *OAC* 3745-52-11(A)
	Must determine if waste is listed as a hazardous waste in 40 *CFR* Part 261 [*OAC* 3745-51-30 to 3745-51-35], or	Generation of solid waste that is not excluded under 40 *CFR* 261.4—**applicable**	40 *CFR* 262.11(b) *OAC* 3745-52-11(B)
	Must determine whether the waste is identified in subpart C of 40 *CFR* 261[*OAC* 3745-51-20 through 3745-51-24], characterizing the waste by using prescribed testing methods or applying generator knowledge based on information regarding material or processes used.	Generation of solid waste that is not listed in subpart D of 40 *CFR* 261 and not excluded under 40 *CFR* 261.4—**applicable**	40 *CFR* 262.11(c) *OAC* 3745-52-11(C)
	Must refer to Parts 261, 262, 264, 265, 266, 268, and 273 of Chapter 40 [*OAC* 3745-51, 3745-54 to 3745-57, 3745-65 to 3745-69, 3745-205, 3745-256, 3745-266, 3745-270, and 3745-273] for possible exclusions or restrictions pertaining to management of the specific waste.	Generation of solid waste that is determined to be hazardous—**applicable**	40 *CFR* 262.11(d) *OAC* 3745-52-11(D)
Characterization of hazardous waste	Must obtain a detailed chemical and physical analysis of a representative sample of the waste(s) that, at a minimum, contains all the information that must be known to treat, store, or dispose of the waste in accordance with 40 *CFR* 264 and 268 [*OAC* 3745-54 to 3745-57, 3745-205, and 3745-270].	Generation of RCRA hazardous waste for storage, treatment or disposal—**applicable**	40 *CFR* 264.13(a)(1) and (2) *OAC* 3745-54-13(A)(1) and (2)
Determinations for land disposal of hazardous waste	Must determine if the waste meets the treatment standards in 40 *CFR* 268.40, 268.45, or 268.49 [*OAC* 3745-270-40, 3745-270-45, and 3745-270-49] by testing in accordance with prescribed methods or use of generator knowledge of waste.	Generation of RCRA hazardous waste for storage, treatment or disposal—**applicable**	40 *CFR* 268.7(a) *OAC* 3745-270-07(A)

---

[a] The requirements portion of the ARARs table is intended to provide a summary of the cited ARAR. The omission of any particular requirement does not limit the scope of the cited ARARs.

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Determinations for land disposal of hazardous waste (continued)	Treatment facilities must test their wastes according to the frequency specified in their waste analysis plans to determine if the waste meets the treatment standards in 40 *CFR* 268.40, 268.45, or 268.49 [*OAC* 3745-270-40, 3745-270-45, and 3745-270-49] prior to disposal.	Treatment of RCRA hazardous waste prior to disposal—**applicable**	40 *CFR* 268.7(b) *OAC* 3745-270-07(B)
	Must determine each EPA Hazardous Waste Number (Waste Code) to determine the applicable treatment standards under 40 *CFR* 268.40 et seq. (*OAC* 3745-270-40 et seq.).	Generation of RCRA hazardous waste for storage, treatment or disposal—**applicable**	40 *CFR* 268.9(a) *OAC* 3745-270-09(A)
	Must determine the underlying hazardous constituents [as defined in 40 *CFR* 268.2(i) and *OAC* 3745-270-02] in the waste.	Generation of RCRA characteristically hazardous waste (and is not D001 nonwastewaters treated by CMBST, RORGS, or POLYM of Section 268.42 Table 1) for storage, treatment or disposal—**applicable**	40 *CFR* 268.9(a) *OAC* 3745-270-09(A)
	Must determine whether the waste meets other applicable treatment standards under 40 *CFR* 268.9 (*OAC* 3745-270-09) for characteristic wastes.	Generation of RCRA characteristically hazardous waste—**applicable**	40 *CFR* 268.9(b) to (d) *OAC* 3745-270-09(B) to (D)
Characterization and management of wastewater (e.g., decon water)	On-site wastewater treatment units (including tank systems, conveyance systems, and ancillary equipment used to treat, store or convey wastewater to the wastewater treatment facility) are exempt from the requirements of RCRA Subtitle C standards.	On-site wastewater treatment units subject to regulation under Section 402 or Section 307(b) of the CWA—**applicable**	40 *CFR* 264.1(g)(6) *OAC* 3745-54-01(G)(6)
Characterization and management of industrial wastewater	Industrial wastewater discharges that are point source discharges under Section 402 of the CWA, as amended, are not solid wastes for purpose of hazardous waste management.	Generation of industrial wastewater for discharge—**applicable**	40 *CFR* 261.4(a)(2) *OAC* 3745-51-04(A)(2)
	No entity shall cause pollution or place or cause to be placed any sewage, sludge, sludge materials, industrial waste, or other wastes in a location where they cause pollution of any waters of the state.		*ORC* 6111.04
	No person shall violate or fail to perform any duty imposed by sections 6111.01 to 6111.08 of the Revised Code or violate any order, rule, or term or condition of a permit issued or adopted by the director of environmental protection pursuant to those sections.		*ORC* 6111.07

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Segregation of scrap metal for recycle	Material is not subject to RCRA requirements for generators, transporters, and storage facilities under 40 *CFR* Parts 262 through 266, 268, 270, or 124 [*OAC* 3745-50-40 to 3745-50-235 or 3745-52, 3745-53, 3745-54 to 3745-57, 3745-65 to 3745-69, 3745-205, 3745-256, 3745-266, and 3745-270].	Scrap metal, as defined in 40 *CFR* 261.1(c)(6) intended for recycle—**applicable**	40 *CFR* 261.6(a)(3)(ii) *OAC* 3745-51-06(A)(3)(b)
Management of recyclable materials for precious metal recovery	Recyclable materials being collected, transported or stored that are being reclaimed to recover economically significant amounts of gold, silver, platinum, palladium, iridium, osmium, rhodium, ruthenium, or any combination of these must be managed in accordance with the substantive requirements of 40 *CFR* 266.70 (*OAC* 3745-266-70).	Management of recyclable materials for precious metal recovery—**applicable**	40 *CFR* 266.70 *OAC* 3745-266-70
Management of spent lead acid batteries being reclaimed	Spent lead acid batteries being collected, transported and stored prior to regeneration must be managed in accordance with particular hazardous waste requirements depending on permit status and whether they are being reclaimed through regeneration or in other ways. Management options are detailed in 40 *CFR* 266.80 (*OAC* 3745-266-80). Spent lead acid batteries can also be managed as universal wastes under 40 *CFR* 273 (*OAC* 3745-273).	Management of spent lead acid batteries being reclaimed—**applicable**	40 *CFR* 266.80 *OAC* 3745-266-80
	Hazardous waste treatment/disposal		
Disposal of RCRA-prohibited hazardous waste in a land-based unit	May be land disposed only if it meets the applicable requirements in the table "Treatment Standards for Hazardous Waste" at 40 *CFR* 268.40 (*OAC* 3745-270-40) before land disposal. The table lists either "total waste" standards, "waste-extract" standards, or "technology-specific" standards (as detailed further in 40 *CFR* 268.42 [*OAC* 3745-270-42]).	Land disposal, as defined in 40 *CFR* 268.2, of RCRA prohibited waste [as listed in 40 *CFR* 268.20 to .39 (*OAC* 3745-270-20 to -39)]—**applicable**	40 *CFR* 268.40(a) *OAC* 3745-270-40(A) 40 *CFR* 268.20 to .40 *OAC* 3745-270-20 to -40 40 *CFR* 268.42 *OAC* 3745-270-42
	For characteristic wastes (D001 – D043) that are subject to the treatment standards, all underlying hazardous constituents must meet the UTSs specified in 40 *CFR* 268.48 (*OAC* 3745-270-48).	Land disposal of restricted RCRA characteristic wastes (D001-D043) that are not managed in a wastewater treatment unit that is regulated under the CWA, that is CWA equivalent, or that is injected into a Class I nonhazardous injection well—**applicable**	40 *CFR* 268.40(e) *OAC* 3745-270-40(E) 40 *CFR* 268.48 *OAC* 3745-270-48

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of RCRA-prohibited hazardous waste in a land-based unit (continued)	May be land disposed if the wastes no longer exhibit a characteristic at the point of land disposal, unless the wastes are subject to a specified method of treatment other than DEACT in 40 *CFR* 628.40 (*OAC* 3745-270-48), or are D003 reactive cyanide.	Land disposal of RCRA-restricted characteristic wastes—**applicable**	40 *CFR* 268.1(c)(4)(iv) *OAC* 3745-270-01(C)(4)
Debris	May be land disposed if treated prior to disposal as provided under the "Alternative Treatment Standards for Hazardous Debris" in 40 *CFR* 268.45(a)(1)-(5) [*OAC* 3745-270-45(A)(1)-(5)] unless it is determined under 40 *CFR* 261.3(f)(2) [*OAC* 3745-51-03(F)(2)] that the debris is no longer contaminated with hazardous waste or the debris is treated to the waste specific treatment standard provided in 40 *CFR* 268.40 (*OAC* 3745-270-40) for the waste contaminating the debris.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous debris—**applicabl**e	40 *CFR* 268.45(a) *OAC* 3745-270-45(A)
	The hazardous debris must be treated for each "contaminant subject to treatment," which must be determined in accordance with 40 *CFR* 268.45(b) [*OAC* 3745-270-45(B)].		40 *CFR* 268.45(b) *OAC* 3745-270-45(B)
Soils	May be land disposed if treated prior to disposal according to the alternative treatment standards of 40 *CFR* 268.49(c) [*OAC* 3745-270-49(C)] or according to the UTSs specified in 40 *CFR* 268.48 (*OAC* 3745-270-48) applicable to the listed hazardous waste and/or applicable characteristic of hazardous waste if the soil is characteristic.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous soils—**applicabl**e	40 *CFR* 268.49(b) and (c) *OAC* 3745-270-49(B) and (C)
Variance from a treatment standard for RCRA restricted hazardous wastes	A variance from a treatment standard may be used if it is: • Not physically possible to treat the waste to the level specified in the treatment standard, or by the method specified as the treatment standard, or • Inappropriate to require the waste to be treated to the level specified in the treatment standard or by the method specified as the treatment standard even though such treatment is technically possible.	Generation of a RCRA hazardous waste requiring treatment prior to land disposal—**applicable**	40 *CFR* 268.44 *OAC* 3745-270-44
Disposal of treated hazardous debris	Debris treated by one of the specified extraction or destruction technologies on Table 1 of this section and which no longer exhibits a characteristic is not a hazardous waste and need not be managed in RCRA subtitle C facility.	Treated debris contaminated with RCRA-listed or characteristic waste—**applicable**	40 *CFR* 268.45(c) *OAC* 3745-270-45(C)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of treated hazardous debris (continued)	Hazardous debris contaminated with listed waste that is treated by an immobilization technology must be managed in a RCRA subtitle C facility.		
Disposal of hazardous debris treatment residues	Except as provided in 268.45(d)(2) and (d)(4) [*OAC* 3745-270-45(D)(2) and (D)(4)], treatment residues must be separated from the treated debris using simple physical or mechanical means, and such residues are subject to the waste-specific treatment standards for the waste contaminating the debris. Layers of debris removed by spalling are hazardous debris that remain subject to treatment standards.	Residues from the treatment of hazardous debris—**applicable**	40 *CFR* 268.45(d)(1) – (5) *OAC* 3745-270-45(D)(1) – (5)
Prohibition of dilution to meet LDRs	Except as provided under 40 *CFR* 268.3(b) [*OAC* 3745-270-03(B)], must not in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with land disposal restriction levels.	Land disposal, as defined in 40 *CFR* 268.2 (*OAC* 3745-270-02), of RCRA-restricted hazardous waste—**applicabl**e	40 *CFR* 268.3(a) *OAC* 3745-270-03(A)
	It is a form of impermissible dilution, and therefore prohibited, to add iron filings or other metallic forms of iron to lead-containing hazardous wastes in order to achieve any land disposal restriction treatment standard for lead.		*OAC* 3745-270-03(D)
Pretreatment standards for discharges to a permitted wastewater treatment unit	Pollutants introduced to POTWs shall not pass through POTWs or interfere with the operation or performance of the POTW. Substances listed in *OAC* 3745-3-04(B) shall not be introduced into a POTW.	Discharge of wastewater containing pollutants to a POTW—**relevant and appropriate**	*OAC* 3745-3-04
	Must notify POTW immediately of all discharges that could cause problems to the POTW, including any slug loading, in accordance with *OAC* 3745-3-05.		*OAC* 3745-3-05
	Industrial users are subject to national categorical pretreatment standards under 40 *CFR* 403.6 and to the general requirements listed in *OAC* 3745-3-09 regarding the interpretation and application of pretreatment standards.		*OAC* 3745-3-09

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of wastewaters containing RCRA hazardous constituents in a CWA wastewater treatment unit	Disposal is not prohibited if the wastes are managed in a treatment system which subsequently discharges to waters of the U.S. under the CWA unless the wastes are subject to a specified method of treatment other than DEACT in 40 *CFR* 268.40 (*OAC* 3745-270-40) or are D003 reactive cyanide.	Disposal of RCRA restricted hazardous wastes that are hazardous only because they exhibit a hazardous characteristic and are not otherwise prohibited under 40 *CFR* Part 268—**applicable**	40 *CFR* 268.1(c)(4)(i) *OAC* 3745-270-01(C)(4)
Disposal of wastewaters in a CWA wastewater treatment unit	No entity shall cause pollution or place or cause to be placed any sewage, sludge, sludge materials, industrial waste, or other wastes in a location where they cause pollution of any waters of the state.	Discharge of contaminants to waters of the state—**applicable**	*ORC* 6111.04
	No person shall violate or fail to perform any duty imposed by sections 6111.01 to 6111.08 to the Revised Code or violate any order, rule, or term or condition of a permit issued or adopted by the director of environmental protection pursuant to those sections.		*ORC* 6111.07
Treatment and disposal of ignitable, reactive, or incompatible RCRA wastes	Must take precautions to prevent accidental ignition or reaction of waste, and waste must be separated and protected from sources of ignition or reaction.	Operation of a RCRA facility that treats or stores ignitable, reactive, or incompatible wastes**—applicable**	40 *CFR* 264.17(a) *OAC* 3745-54-17(A)
	Must take precautions to prevent reactions that: • Generate extreme heat, pressure, fire or explosion, or violent reactions • Produce uncontrolled toxic mists, fumes, dusts, or gases in sufficient quantities to threaten human health or the environment • Produce uncontrolled flammable fumes or gases in sufficient quantities to pose a risk of fire or explosions • Damage the structural integrity of the device or facility • Through other like means threaten human health or the environment.		40 *CFR* 264.17(b) *OAC* 3745-54-17(B)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Transportation of hazardous wastes and materials[b]			
Transportation of hazardous waste on site	The generator manifesting requirements of 40 *CFR* 262.20 to 262.32(b) [*OAC* 3745-52-20 to 3745-52-23 and 3745-52-32(B)] do not apply. Generator or transporter must comply with the requirements set forth in 40 *CFR* 263.30 and 263.31 [*OAC* 3745-53-30 and 3745-53-31] in the event of a discharge of hazardous waste on a private or public right-of-way.	Transportation of hazardous wastes on a public or private right-of-way within or along the border of contiguous property under the control of the same person, even if such contiguous property is divided by a public or private right-of-way—**applicable**	40 *CFR* 262.20(f) *OAC* 3745-52-20(F)
Transportation of hazardous materials on site	Must meet the substantive requirements of 49 *CFR* Parts 171-174, 177, and 178 or the site or facility specific Transportation Safety Document (i.e., *Transportation Safety Document for the On-Site Transfer of Hazardous Material at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* [LPP 2008]).	Transport of hazardous materials on the PORTS facility – **TBC**	DOE Order 460.1C(4)(b)
Transportation of hazardous waste off site	Must comply with the generator requirements of 40 *CFR* 262.20 to 262.23 [*OAC* 3745-52-20 to 3745-52-23] for manifesting, Section 262.30 [*OAC* 3745-52-30] for packaging, Section 262.31 [*OAC* 3745-52-31] for labeling, Section 262.32 [*OAC* 3745-52-32] for marking, Section 262.33 [*OAC* 3745-52-33] for placarding, Sections 262.40 and 262.41(a) [*OAC* 3745-52-40 and 3745-52-41] for record keeping requirements, and Section 262.12 [*OAC* 3745-52-12] to obtain EPA ID number.	Preparation of RCRA hazardous waste for transport off site—**applicable**	40 *CFR* 262.10(h) *OAC* 3745-52-10(H) 40 *CFR* 262.20 to .23 *OAC* 3745-52-20 to -23 40 *CFR* 262.30 to .33 *OAC* 3745-52-30 to -33
Transportation of hazardous materials off site	Any person who, under contract with a department or agency of the Federal government, transports "in commerce," or causes to be transported or shipped, a hazardous material, shall be subject to and must comply with all applicable provisions of the HMTA and HMR at 49 *CFR* 171 – 180 related to marking, labeling, placarding, etc.	Preparation for transport or shipment "in commerce" of a hazardous material—**applicable**	49 *CFR* 171.1(c)

---

[b] As noted in the DFF&O, Paragraph 9.a, the NCP at 40 *CFR* 300.400(e)(1) defines "on-site" as meaning "the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for the implementation of the response action." Off-site transportation, by definition, is not an on-site response action and is subject to all substantive, procedural, and administrative requirements of all legally applicable laws, but not to any requirements that might be relevant and appropriate under the ARARs process.

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
SOLID WASTE			
Disposal of solid wastes	Except as provided in paragraph (D) of *OAC* 3745-27-02, no person shall establish or modify a solid waste disposal facility without meeting the substantive criteria as follows:	Management and disposal of solid waste, as defined in *OAC* 3745-27-01[c] **—applicable**	*OAC* 3745-27-02(A)
	Disposal of solid wastes shall only be by the following methods or combination thereof:		*OAC* 3745-27-05(A)
	• Disposal at a licensed sanitary landfill facility		*OAC* 3745-27-05(A)(1)
	• Incinerating at a licensed incinerator		*OAC* 3745-27-05(A)(2)
	• Composting at a licensed composting facility		*OAC* 3745-27-05(A)(3)
	• Alternative disposal methods either as engineered fill or land application, provided use will not create a nuisance or harm human health or the environment and is capable of complying with other applicable laws.		*OAC* 3745-27-05(A)(4)
Prohibition on open dumping of solid wastes	Temporary storage of putrescible solid wastes in excess of 7 days, or temporary storage of any solid wastes where such storage causes a nuisance or health hazard shall be considered open dumping.	Temporary storage of solid waste prior to collection for disposal or transfer—**applicable**	*OAC* 3745-27-03(A)(2)
	No person shall conduct, permit, or allow open dumping. In the event that open dumping is or has occurred, person(s) responsible shall promptly remove and dispose or otherwise manage the solid waste and shall submit verification that the waste has been properly managed.	Management and disposal of solid waste**—applicable**	*OAC* 3745-27-05(C)
TSCA/PCB WASTES			
PCB waste generation, characterization, and segregation			
Management of PCB Items	Any person removing from use a PCB item containing an intact and nonleaking PCB article must dispose of it in accordance with Section 761.60(b), or decontaminate it in accordance with Section 761.79. PCB items where the PCB articles are no longer intact and nonleaking are regulated for disposal as PCB bulk product waste under Section 761.62(a) or (c).	Management of PCB waste for storage or disposal—**applicable**	40 *CFR* 761.50(b)(2)

[c] Definitions of terms used in the Ohio solid waste regulations are given in *OAC* 3745-27-01.

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Management of PCB waste	Any person storing or disposing of PCB waste must do so in accordance with 40 *CFR* 761, Subpart D.	Storage or disposal of waste containing PCBs at concentrations ≥ 50 ppm—**applicable**	40 *CFR* 761.50(a)
	Any person cleaning up and disposing of PCBs shall do so based on the concentration at which the PCBs are found.	Cleanup or disposal of PCB remediation waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.61
Decontamination of PCB contaminated materials prior to use, re-use, distribution, in commerce or disposal as a non-TSCA waste	Chopping (including wire chopping), distilling, filtering, oil/water separation, spraying, soaking, wiping, stripping of insulation, scraping, scarification or the use of abrasives or solvents may be used to remove or separate PCBs to the decontamination standards for liquids, concrete, or nonporous surfaces, as listed in 40 *CFR* 761.79(b).	Generation of PCB wastes, including water, organic liquids, nonporous surfaces (scrap metal from disassembled electrical equipment), concrete, and nonporous surfaces covered with porous surfaces, such as paint or coating on metal—**applicable**	40 *CFR* 761.79(b)
Decontamination of water containing PCBs to levels acceptable for discharge	For water discharged to a treatment works or to navigable waters, decontaminate to < 3 µg/L (approximately < 3 ppb) or a PCB discharge limit included in a permit issued under Section 304(b) or 402 of the CWA.	Discharge of water containing PCBs to a treatment works or navigable waters—**applicable**	40 *CFR* 761.79(b)(1)(ii)
Decontamination of water containing PCBs to levels acceptable for unrestricted use	Decontaminate to ≤ 0.5 µg/L (approximately ≤ 0.5 ppb) for unrestricted use.	Release of water containing PCBs for unrestricted use—**applicable**	40 *CFR* 761.79(b)(1)(iii)
Decontamination of organic liquids or nonaqueous inorganic liquids containing PCBs	For organic liquids or nonaqueous inorganic liquids containing PCBs, decontamination standard is < 2 mg/kg (i.e., < 2 ppm) PCBs.	Release of organic liquids or nonaqueous liquid containing PCBs—**applicable**	40 *CFR* 761.79(b)(2)
Decontamination of nonporous surfaces in contact with liquid PCBs to levels acceptable for unrestricted use	For nonporous surfaces previously in contact with liquid PCBs at any concentration, where no free-flowing liquids are currently present, ≤ 10 µg PCBs per 100 sq cm (≤ 10 µg/ 100 cm^2) as measured by a standard wipe test (40 *CFR* 761.123) at locations selected in accordance with Subpart P of 40 *CFR* 761.	Release of nonporous surfaces in contact with liquid PCBs at any concentration for unrestricted use—**applicable**	40 *CFR* 761.79(b)(3)(i)(A)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Decontamination of nonporous surfaces in contact with nonliquid PCBs to levels acceptable for unrestricted use	For nonporous surfaces in contact with nonliquid PCBs (including nonporous surfaces covered with a porous surface, such as paint or coating on metal), clean to Visual Standard No. 2, Near-White Blast Cleaned Surface Finish of the NACE. A person shall verify compliance with standard No. 2 by visually inspecting all cleaned areas.	Release of nonporous surfaces in contact with nonliquid PCBs for unrestricted use—**applicable**	40 *CFR* 761.79(b)(3)(i)(B)
Decontamination of nonporous surfaces in contact with liquid PCBs to levels acceptable for disposal in a TSCA smelter	For nonporous surfaces previously in contact with liquid PCBs at any concentration, where no free-flowing liquids are currently present, decontaminate to < 100 µg/100 cm^2 as measured by a standard wipe test (Section 761.123) at locations selected in accordance with Subpart P of 40 *CFR* 761.	Disposal of nonporous surfaces previously in contact with liquid PCBs at any concentration into a smelter operating in accordance with Section 761.72(b)—**applicable**	40 *CFR* 761.79(b)(3)(ii)(A)
	For nonporous surfaces in contact with nonliquid PCBs (including nonporous surfaces covered with a porous surface, such as paint or coating on metal) clean to Visual Standard No. 3, Commercial Blast Cleaned Surface Finish, of the NACE A person shall verify compliance with Standard No. 3 by visually inspecting all cleaned areas.		40 *CFR* 761.79(b)(3)(ii)(B)
Decontamination of concrete recently contaminated with PCBs	Decontamination standard for concrete is < 10 µg/100 cm^2 as measured by a standard wipe test (Section 761.123) if the decontamination procedure is commenced within 72 hours of the initial spill of PCBs to the concrete or portion thereof being decontaminated.	Decontamination of concrete within 72 hours of the initial spill of PCBs to the concrete—**applicable**	40 *CFR* 761.79(b)(4)
Risk-based decontamination of PCB-containing materials	May decontaminate to an alternate risk-based decontamination standard under 40 *CFR* 761.79(h) if the standard does not pose an unreasonable risk of injury to health or the environment.	Decontamination of materials contaminated with PCBs—**applicable**	40 *CFR* 761.79(h)
Management of PCB/radioactive waste	Any person storing such waste ≥ 50 ppm PCBs must do so taking into account both its PCB concentration and radioactive properties, except as provided in 40 *CFR* 761.65(a)(1), (b)(1)(ii) and (c)(6)(i).	Generation of PCB/radioactive waste for disposal—**applicable**	40 *CFR* 761.50(b)(7)(i)
	Any person disposing of such waste must do so taking into account both its PCB concentration and its radioactive properties.		40 *CFR* 761.50(b)(7)(ii)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Management of PCB/radioactive waste (continued)	If, after taking into account only the PCB properties in the waste, the waste meets the requirements for disposal in a facility permitted, licensed, or registered by a state as a municipal or nonmunicipal nonhazardous waste landfill, then the person may dispose of such waste without regard to the PCBs, based on its radioactive properties alone.		40 *CFR* 761.50(b)(7)(ii)
PCB waste treatment/disposal			
Performance-based disposal of PCB remediation waste	Shall be disposed according to 40 *CFR* 761.60(a) or (e), or decontaminated in accordance with 40 *CFR* 761.79.	Disposal of liquid PCB remediation waste—**applicable**	40 *CFR* 761.61(b)(1)
	May dispose by one of the following methods: • In a high-temperature incinerator under 40 *CFR* 761.70(b) • By an alternate disposal method under 40 *CFR* 761.60(e) • In a chemical waste landfill under 40 *CFR* 761.75 • In a facility under 40 *CFR* 761.77 or • Through decontamination in accordance with 40 *CFR* 761.79.	Disposal of nonliquid PCB remediation waste (as defined in 40 *CFR* 761.3) —**applicable**	40 *CFR* 761.61(b)(2) 40 *CFR* 761.61(b)(2)(i) 40 *CFR* 761.61(b)(2)(ii)
Disposal of materials previously contaminated with PCBs as non-TSCA waste	Materials from which PCBs have been removed by decontamination in accordance with 40 *CFR* 761.79, not including decontamination wastes and residuals under 40 *CFR* 761.79(g), are considered unregulated for disposal under Subpart D of TSCA (40 *CFR* 761).	Disposal of materials from which PCBs have been removed—**applicable**	40 *CFR* 761.79(a)(4)
Risk-based disposal of PCB remediation waste	May dispose of in a manner other than prescribed in 40 *CFR* 761.61(a) or (b) if the method will not pose an unreasonable risk of injury to health or the environment.	Disposal of PCB remediation waste—**applicable**	40 *CFR* 761.61(c)
Disposal of PCB decontamination waste and residues	Shall be disposed of at their existing PCB concentration unless otherwise specified in 40 *CFR* 761.79(g).	PCB decontamination waste and residues for disposal—**applicable**	40 *CFR* 761.79(g)
Disposal of PCB liquids (e.g., from drained electrical equipment)	Must be disposed of in an incinerator that complies with 40 *CFR* 761.70, except:	PCB liquids at concentrations ≥ 50 ppm—**applicable**	40 *CFR* 761.60(a)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of PCB liquids (e.g., from drained electrical equipment) (continued)	For mineral oil dielectric fluid, may be disposed in a high efficiency boiler according to 40 *CFR* 761.71(a).		40 *CFR* 761.60(a)(1)
	For liquids other than mineral oil dielectric fluid, may be disposed in a high efficiency boiler according to 40 *CFR* 761.71(b).		40 *CFR* 761.60(a)(2)
Disposal of PCB-contaminated precipitation, condensation, or leachate	May be disposed in a chemical waste landfill that complies with 40 *CFR* 761.75 if:	PCB liquids at concentrations ≥ 50 ppm from incidental sources and associated with PCB articles or nonliquid PCB wastes—**applicable**	40 *CFR* 761.60(a)(3)
	• Disposal does not violate 40 *CFR* 268.32(a) or 268.42(a)(1) and		40 *CFR* 761.60(a)(3)(i)
	• Liquids do not exceed 500 ppm and are not ignitable waste as described in 40 *CFR* 761.75(b)(8)(iii).		40 *CFR* 761.60(a) (3)(ii)
Disposal of PCB transformers	Shall be disposed of in either:	PCB-contaminated electrical equipment (including transformers that contain PCBs at concentrations of ≥ 50 ppm and < 500 ppm in the contaminating fluid) as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.60(b)(1)
	• An incinerator that complies with 40 *CFR* 761.70 or		40 *CFR* 761.60(b)(1) (i)(A)
	• A chemical waste landfill that is compliant with 40 *CFR* 761.75 provided all free flowing liquid is removed from the transformer, the transformer is filled with a solvent, the transformer is allowed to stand for at least 18-continuous hours, and then the solvent is thoroughly removed.		40 *CFR* 761.60(b)(1) (i)(B)
Performance-based disposal of PCB bulk product waste	May dispose of by one of the following:	Disposal of PCB bulk product waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.62(a)
	• In an incinerator under Section 761.70		40 *CFR* 761.62(a)(1)
	• In a chemical waste landfill under Section 761.75		40 *CFR* 761.62(a)(2)
	• In a hazardous waste landfill under Section 3004 or Section 3006 of RCRA		40 *CFR* 761.62(a)(3)
	• Under alternate disposal under Section 761.60(e)		40 *CFR* 761.62(a)(4)
	• In accordance with decontamination provisions of Section 761.79		40 *CFR* 761.62(a)(5)
	• In accordance with the thermal decontamination provisions of Section 761.79(e)(6) for metal surfaces in contact with PCBs.		40 *CFR* 761.62(a)(6)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Risk-based disposal of PCB bulk product waste	May dispose of in a manner other than that prescribed in 40 *CFR* 761.62(a) if the method will not pose an unreasonable risk of injury to health or the environment.	Disposal of PCB bulk product waste as defined in 40 *CFR* 761.3—**applicable**	40 *CFR* 761.62(c)
Disposal of PCB bulk product waste in solid waste landfill	May dispose of the following in a municipal or nonmunicipal nonhazardous waste landfill.	Disposal of nonliquid PCB bulk product waste listed in 40 *CFR* 761.62(b)(1)—**applicabl**e	40 *CFR* 761.62(b)(1)
	• Plastics (such as plastic insulation from wire or cable; radio, television and computer casings; vehicle parts; or furniture laminates); preformed or molded rubber parts and components; applied dried paints, varnishes, waxes or other similar coatings or sealants; caulking; Galbestos; nonliquid building demolition debris; or nonliquid PCB bulk product waste from the shredding of automobiles or household appliances from which PCB small capacitors have been removed (shredder fluff)		40 *CFR* 761.62(b)(1)(i)
	• Other PCB bulk product waste, sampled in accordance with the protocols set out in subpart R of 40 *CFR* Part 761, that leaches PCBs at < 10 μg/L of water measured using a procedure used to simulate leachate generation.		40 *CFR* 761.62(b)(1)(ii)
	May dispose of in a municipal or nonmunicipal nonhazardous waste landfill if:	PCB bulk product waste not meeting conditions of 40 *CFR* 761.62(b)(1) (e.g., paper/felt gaskets contaminated by liquid PCBs)—**applicable**	40 *CFR* 761.62(b)(2)
	• The PCB bulk product waste is segregated from organic liquids disposed of in the landfill and		40 *CFR* 761.62(b)(2)(i)
	• Leachate is collected from the landfill and monitored for PCBs.		40 *CFR* 761.62(b)(2)(ii)
Disposal of fluorescent light ballasts	Must be disposed of in a TSCA disposal facility as bulk product waste under 40 *CFR* 761.62 or in accordance with the decontamination provisions of 40 *CFR* 761.79.	Generation for disposal of fluorescent light ballasts containing PCBs in the potting material—**applicable**	40 *CFR* 761.60(b)(6)(iii)
Disposal of PCB-contaminated electrical equipment (except capacitors)	Must remove all free-flowing liquid from the electrical equipment and dispose of the removed liquid in accordance with 40 *CFR* 761.60(a) and	Generation of PCB-contaminated electrical equipment (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(4)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of PCB-contaminated electrical equipment (except capacitors) (continued)	Dispose of by one of the following methods: • In a facility managed as a municipal solid waste or nonmunicipal nonhazardous waste • In an industrial furnace operating in compliance with 40 *CFR* 761.72 or • In a disposal facility under 40 *CFR* 761.60.	Drained PCB-contaminated electrical equipment, including any residual liquids—**applicable**	40 *CFR* 761.60(b)(4)(i)
Disposal of PCB capacitors	Any person must assume that a capacitor manufactured prior to July 2, 1979, whose PCB concentration is not established, contains ≥ 500 ppm PCBs. If the date of manufacture is unknown, any person must assume the capacitor contains ≥ 500 ppm PCBs.	Generation of PCB capacitors with ≥ 500 ppm PCBs for disposal—**applicable**	40 *CFR* 761.2(a)(4)
	Shall comply with all requirements of 40 *CFR* 761.60 unless it is known from label or nameplate information, manufacturer's literature, or chemical analysis that capacitor does not contain PCBs.		40 *CFR* 761.60(b)(2)(i)
	Shall dispose of in accordance with either of the following: • Disposal in an incinerator that complies with 40 *CFR* 761.70 or • Disposal in a chemical waste landfill that complies with 40 *CFR* 761.75.	Generation of PCB capacitors with ≥ 500 ppm PCBs for disposal—**applicable**	40 *CFR* 761.60(b)(2)(iii)
	Shall dispose of in one of the following disposal facilities approved under 40 *CFR* 761.60: • Incinerator under 40 *CFR* 761.70 • Chemical waste landfill under 40 *CFR* 761.75 • High-efficiency boiler under 40 *CFR* 761.71 • Scrap metal recovery oven or smelter under 40 *CFR* 761.72.	Disposal of large capacitors that contain ≥ 50 ppm but < 500 ppm PCBs—**applicable**	40 *CFR* 761.60(b)(4)(ii)
	May dispose of in municipal solid waste landfill.	Generation of PCB small capacitors (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(2)(ii)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of PCB-contaminated articles	Must remove all free-flowing liquid from the article, disposing of the liquid in compliance with the requirements of 40 *CFR* 761.60(a)(2) or (a)(3), and	Generation of PCB-contaminated articles (as defined in 40 *CFR* 761.3) for disposal—**applicable**	40 *CFR* 761.60(b)(6)(ii)
	Dispose by one of the following methods: • In accordance with the decontamination provisions at 40 *CFR* 761.79 • In a facility managed as a municipal solid waste or nonmunicipal nonhazardous waste • In an industrial furnace operating in compliance with 40 *CFR* 761.72, or • In a disposal facility under 40 *CFR* 761.60.	Disposal of PCB-contaminated articles with no free-flowing liquid—**applicable**	40 *CFR* 761.60(b)(6)(ii)(A) thru (D)
Transportation of PCB wastes off site for disposal	Must comply with the manifesting provisions at 40 *CFR* 761.207 through 218.	Preparation for relinquishment of control over PCB wastes by transporting or offering for transport—**applicable**	40 *CFR* 761.207(a)
RADIOACTIVE WASTE			
Radiation protection of the public and the environment	Except as provided in 458.1(4)(c), exposure to individual members of the public from radiation shall not exceed a total EDE of 0.1 rem/year (100 mrem/year), an equivalent dose to the lens of the eye exceeding 1,500 mrem/year, or an equivalent dose to the skin or extremities exceeding 5,000 mrem/year, exclusive of the dose contributions from background radiation, any medical administration the individual has received, or voluntary participation in medical/research programs.	Release of radionuclides to the environment from all sources of ionizing radiation and exposure pathways at a DOE facility that could contribute significantly to the total dose—**TBC**	DOE Order 458.1(4)(b) and (c)
	Shall use, to the extent practicable, procedures and engineering controls based on sound radiation protection principles to achieve doses to members of the public that are ALARA.		DOE Order 458.1(4)(d)
	Except as provided in *OAC* 3701:1-38-13(C), exposure to individual members of the public from radiation shall not exceed 1 millisievert (0.1 rem) in a year, exclusive of the dose contributions from background radiation, any medical administration the individual has received, or voluntary participation in medical/research programs.	Licensee or registrant conducting operations that release radioactivity—**relevant and appropriate**	*OAC* 3701:1-38-13(A)(1)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Radiation protection of the public and the environment (continued)	The dose in any unrestricted area from external sources, exclusive of the dose contribution from patients administered radioactive material and released in accordance with *OAC* 3701:1-58-30 or equivalent U.S. nuclear regulatory agency or agreement state regulations, shall not exceed 0.02 millisievert (0.002 rem) in any 1 hour.		*OAC* 3701:1-38-13(A)(2)
Management, storage and disposal of LLW waste	Management, storage, and disposal must be conducted in a manner such that exposure to members of the public to radiation from radioactive waste complies with ALARA process requirements and does not exceed a TED of 25 mrem in a year from all exposure pathways and radiation sources associated with the waste, except for transportation and radon and its decay products.	Management, storage, and disposal of LLW—**TBC**	DOE Order 458.1(h)(1)(c)
Characterization of LLW	Shall be characterized using direct or indirect methods and the characterization documented in sufficient detail to ensure safe management and compliance with the WAC of the receiving facility.	Generation of LLW for storage or disposal at a DOE facility—**TBC**	DOE M 435.1-1(IV)(I)
	Characterization data shall, at a minimum, include the following information relevant to the management of the waste:		DOE M 435.1-1(IV)(I)(2)
	• Physical and chemical characteristics		DOE M 435.1-1(IV)(2)(a)
	• Volume, including the waste and any stabilization or absorbent media		DOE M 435.1-1 (IV)(I)(2)(b)
	• Weight of the container and contents		DOE M 435.1-1 (IV)(I)(2)(c)
	• Identities, activities, and concentrations of major radionuclides		DOE M 435.1-1 (IV)(I)(2)(d)
	• Characterization date		DOE M 435.1-1 (IV)(I)(2)(e)
	• Generating source, and		DOE M 435.1-1 (IV)(I)(2)(f)
	• Any other information that may be needed to prepare and maintain the disposal facility performance assessment, or demonstrate compliance with performance objectives.		DOE M 435.1-1 (IV)(I)(2)(g)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Packaging of solid LLW	Shall be packaged in a manner that provides containment and protection for the duration of the anticipated storage period and until disposal is achieved or until the waste has been removed from the container.	Storage of LLW in containers at a DOE facility—**TBC**	DOE M 435.1-1 (IV)(L)(1)(a)
	Vents or other measures shall be provided if the potential exists for pressurizing or generating flammable or explosive concentrations of gases within the waste container. Containers shall be marked such that their contents can be identified.		DOE M 435.1-1 (IV)(L)(1)(b) and (c)
Release of radiological materials or scrap metal for reuse	Before being released, property shall be monitored or surveyed to determine the types and quantities of residual radioactive material within the property; the quantities of removable and total residual radioactive material on property surfaces (including residual radioactive material on or under any coating); and that contamination within or on the property is in compliance with applicable DOE Authorized Limits of DOE Order 458.1(4)(k)(6).	Radionuclide-contaminated materials and equipment intended for unrestricted use—**TBC**	DOE Order 458.1(4)(k)(3)(b)(1)–(2) and (4)
	Where potentially contaminated surfaces are difficult to access for measurement (as in some pipes, drains, and ductwork), such property may be released after case-by-case evaluation and documentation based on both the history of its use and available measurements sufficient to demonstrate that the unsurveyable surfaces are likely to meet DOE Authorized Limits.		DOE Order 458.1(4)(k)(3)(b)(3)
Treatment of LLW	Waste treatment to provide more stable waste forms and to improve the long-term performance of a LLW disposal facility shall be implemented as necessary to meet performance objectives of the disposal facility.	Generation of LLW for disposal at a DOE LLW disposal facility—**TBC**	DOE M 435.1-1(IV)(O)
Disposal of solid LLW at DOE facilities	Shall meet waste acceptance requirements before it is transferred to the receiving facility.	Generation of LLW for disposal at a DOE facility—**TBC**	DOE M 435.1-1(IV)(J)(2)
Transportation of radioactive waste	Shall be packaged and transported in accordance with the substantive requirements of DOE Order 460.1C (*Packaging and Transportation Safety*) and DOE Order 460.2A (*Departmental Materials Transportation and Packaging Management*).	Preparation of shipment of radioactive waste—**TBC**	DOE M 435.1-1 (I)(1)(E)(11)
	To the extent practicable, the volume of waste and number of shipments shall be minimized.		DOE M 435.1-1 (III)(L)(2) DOE M 435.1-1 (IV)(L)(2)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
ASBESTOS-CONTAINING WASTES			
Management of ACM prior to disposal	Discharge no visible emissions to the outside air or use one of the emission control and waste treatment methods specified in paragraphs (a)(1) through (a)(4) of 40 *CFR* 61.150 [paragraphs (B)(1) through (B)(4) of *OAC* 3745-20-05].	Generation, collection, processing, packaging, and transportation of any asbestos-containing waste material that is not Category I or II nonfriable ACM waste that did not become crumbled, pulverized, or reduced to powder [40 *CFR* 61.150(a) (5)]—**applicable**	40 *CFR* 61.150(a) *OAC* 3745-20-05(B)
	All asbestos-containing waste material shall be deposited as soon as practicable at a waste disposal site operated in accordance with the provisions of 40 *CFR* 61.154 [*OAC* 3745-20-06] or an appropriate site that coverts RACM and asbestos-containing waste materials into nonasbestos (asbestos-free) materials according to the provisions of 40 *CFR* 61.155 [*OAC* 3745-20-13].		40 *CFR* 61.150(b)(1) - (2) *OAC* 3745-20-05(A)
	The requirements of 40 *CFR* 61.150(b)(1) and (2) [*OAC* 3745-20-05(A)]do not apply to Category I nonfriable ACM that is not RACM.		40 *CFR* 61.150(b)(3) *OAC* 3745-20-05(A)(4)
Disposal of asbestos-containing waste material (e.g., transite siding, pipe lagging, insulation, ceiling tiles)	All asbestos-containing waste material must be deposited as soon as practicable at a waste disposal site operated in accordance with Section 61.154 [*OAC* 3745-20-06] or a site that converts RACM and asbestos-containing waste material into nonasbestos (asbestos free) material according to the provisions of 40 *CFR* 61.155 [*OAC* 3745-20-13].	Removal and disposal of RACM except Category I nonfriable asbestos containing material—**applicable**	40 *CFR* 61.150(b)(1) and (2) *OAC* 3745-20-05(A)
	May use an alternative emission control and waste treatment method that will control asbestos emissions equivalent to currently required methods, the alternative method is suitable for the intended application, and the alternative method will not violate other regulations and will not result in increased water or land pollution or occupational hazards.		40 *CFR* 61.150(a)(4) *OAC* 3745-20-05(B)(4)
Transportation of asbestos-containing waste materials off site	For asbestos-containing waste material to be transported off the facility site, label containers or wrapped materials with the name of the waste generator and location at which the waste was generated.	Preparation for transport of asbestos-containing waste materials off site—**applicable**	40 *CFR* 61.150(a)(1)(v) *OAC* 3745-20-05(C)(1)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Transportation of asbestos-containing waste materials off site (continued)	Mark vehicles used to transport asbestos-containing waste material during the loading and unloading of waste so that the signs are visible. The markings must conform to the requirements of 40 *CFR* 61.149(d)(1)(i), (ii), and (iii).		40 *CFR* 61.150(c) *OAC* 3745-20-05(E)
UNIVERSAL WASTES			
Characterization and management of universal waste	A large quantity handler of universal waste is prohibited from disposing, diluting, or treating universal waste except in accordance with 40 *CFR* 273 [*OAC* 3745-273-33 or 3745-273-37].	Generation of universal waste [as defined in 40 *CFR* 273 and *OAC* 3745-273] for disposal—**applicable**	40 *CFR* 273.31 *OAC* 3745-273-31
	A large quantity handler of universal waste must manage universal waste in accordance with 40 *CFR* 273 [*OAC* 3745-273-33] in a way that prevents releases of any universal waste or component of a universal waste to the environment.		40 *CFR* 273.33 *OAC* 3745-273-33(A)
	Must label or mark the universal waste to identify the type of universal waste.		40 *CFR* 273.34 *OAC* 3745-273-34
	May accumulate waste for no longer than 1 year from the date the waste is generated or received from another handler unless the requirements of 40 *CFR* 273.35(b) [*OAC* 3745-273-35(B)] are met		40 *CFR* 273.35(a) *OAC* 3745-273-35(A)
	May accumulate universal waste for longer than 1 year from the date the universal waste is generated or received from another handler if such activity is solely for the purpose of accumulation of such quantities of universal waste as necessary to facilitate proper recovery, treatment, or disposal. However, the handler bears the burden of proving that such activity was solely for this purpose.		40 *CFR* 273.35(b) *OAC* 3745-273-35(B)
	Shall ensure that all employees are thoroughly familiar with proper waste handling and emergency procedures relative to their responsibilities during normal facility operations and emergencies.		40 *CFR* 273.36 *OAC* 3745-273-36

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Characterization and management of universal waste (continued)	A large quantity handler of universal waste must immediately contain all releases of universal wastes and other residues from universal wastes, and must determine whether any material resulting from the release is hazardous waste, and if so, must manage the hazardous waste in compliance with all applicable requirements.		40 *CFR* 273.37 *OAC* 3745- 273.37
Transportation of universal waste off site	Off-site shipments of universal waste by a large quantity handler of universal waste shall be made in accordance with 40 *CFR* 273.38 [*OAC* 3745-273-38].	Preparation of universal waste for transport off site—**applicable**	40 *CFR* 273.38(c) *OAC* 3745-273-38(A), (C), (D), and (E)
	Must keep a record of each shipment of universal waste received and sent from the facility and retain record for at least 3 years. Record must include waste handler, shipper, or destination facility name and address, quantity and type of waste, and date shipment left or was received at facility.		40 *CFR* 273.39 *OAC* 3745-273.39
	Off-site shipments to a foreign destination must comply with requirements applicable to a primary exporter in *OAC* 3745-52-10, 3745-52-53, 3745-52-56 and 3745-52-57 and export waste only upon consent of the receiving country and in conformance with the EPA "Acknowledgement of Consent" as defined in *OAC* 3745-52-50 to 3745-52-57. A copy of the consent must be provided to the transporter.		40 *CFR* 273.40 *OAC* 3745-273.40
Management of universal waste batteries	A large quantity handler of universal waste must contain any universal waste battery that shows evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions in a container.	Generation of universal waste batteries [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-02]—**applicable**	40 *CFR* 273.33(a)(1) *OAC* 3745-273-33(A)(1)
	Container must be closed, structurally sound, compatible with the contents of the battery, and lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions.		
	Batteries, or container or tank in which the batteries are contained, must be labeled or marked clearly with any one of the following phrases: "Universal Waste – Battery(ies)" or "Waste Batter(ies)" or "Used Battery(ies)."		40 *CFR* 273.34(a) *OAC* 3745-273-34(A)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Management of universal waste pesticides	A large quantity handler of universal waste pesticide must contain the pesticide in a container that remains closed, structurally sound, compatible with the pesticide, and that lacks evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions. A leaking pesticide container must be put into an overpack container, tank, or transport container, as detailed in 40 *CFR* 273.33(b) [*OAC* 3745-273-33(B)].	Generation of universal waste pesticides [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-03]—**applicable**	40 *CFR* 273.33(b) *OAC* 3745-273-33(B)(1) – (4)
	A container, tank, transport vehicle or vessel in which recalled or unused pesticides are contained must be labeled or marked clearly with the label that was on or accompanied the product and the word “Universal Waste – Pesticide(s)” or “Waste – Pesticide(s).”		40 *CFR* 273.34(b) and (c) *OAC* 3745-273-34(B) and (C)
Management of universal waste thermostats or other mercury-containing equipment	A large quantity handler of universal waste must contain any mercury-containing equipment that shows evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions in a container.	Generation of universal waste mercury-containing equipment [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-04]—**applicable**	40 *CFR* 273.33(c)(1) *OAC* 3745-273-33(C)(1)
	Container must be closed, structurally sound, compatible with the contents of the thermostat, and lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions, and be reasonably designed to prevent the escape of mercury into the environment by volatilization or any other means.		
	May remove the mercury-containing ampule or the open original housing holding the mercury from mercury-containing equipment and manage and dispose of it in accordance with regulations.		40 *CFR* 273.33(c)(2) - (4) *OAC* 3745-273-33(C)(2) - (4)
	Mercury-containing equipment or a container in which the equipment is contained must be labeled or marked clearly with any of the following phrases: “Universal Waste – Mercury-Containing Equipment” or Waste Mercury-Containing Equipment” or “Used Mercury-Containing Equipment.”		40 *CFR* 273.34(d)(1) *OAC* 3745-273-34(D)(1)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Management of universal waste thermostats or other mercury-containing equipment (continued)	Mercury-containing thermostats or containers containing only these thermostats must be labeled or marked clearly with any of the following phrases: "Universal Waste – Mercury Thermostat(s)" or "Waste Mercury Thermostat(s)" or "Used Mercury Thermostat(s)."		40 *CFR* 273.34(d)(2) *OAC* 3745-273-34(D)(2)
Management of universal waste lamps (fluorescent, mercury vapor)	A large quantity handler of universal waste must contain any lamp in containers or packages that are structurally sound, adequate to prevent breakage, and compatible with the contents of the lamps. Such containers and packages must remain closed and must lack evidence of leakage, spillage, or damage that could cause leakage of hazardous constituents under reasonably foreseeable conditions.	Generation of universal waste lamps [as defined in 40 *CFR* 273.9 and *OAC* 3745-273-05] —**applicable**	40 *CFR* 273.33(d)(1) *OAC* 3745-273-33(D)(1)
	A large quantity handler of universal waste lamp must immediately clean up and place in a container any lamp that is broken and must place in a container any lamp that shows evidence of breakage, leakage, or damage that could cause the release of mercury or other hazardous constituents to the environment.		40 *CFR* 273.33(d)(2) *OAC* 3745-273-33 (D)(2)
	Each lamp or container or package in which such lamps are contained must be labeled or marked clearly with one of the following phrases: "Universal Waste-Lamp(s)," or "Waste Lamps," or "Used Lamps."		40 *CFR* 273.34(e) *OAC* 3745-273-34(E)
	Mark or label the individual item with the date the lamp(s) became a waste, or mark or label the container or package with the date the wastes were received.		40 *CFR* 273.35(c) *OAC* 3745-273-35(C)
MISCELLANEOUS WASTES			
	Beryllium-containing wastes		
Release of beryllium-contaminated equipment or other items	Must clean beryllium-contaminated equipment or other items to the lowest contamination level practicable, not to exceed the levels established in 10 *CFR* 850.31(b) and (c) and label them before release.	Release of beryllium-contaminated equipment or other items to general public or another DOE facility—**applicable**	10 *CFR* 850.31(a)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Release of beryllium-contaminated equipment or other items (continued)	Before being released to the general public or another DOE facility, ensure that the removable contamination level of equipment and item surfaces does not exceed the higher of 0.2 µg/100 cm^2 or the concentration level of beryllium in soil at the point or release, whichever is greater;		10 *CFR* 850.31(b)(1)
	Ensure equipment or item is labeled in accordance with 10 *CFR* 850.38(b); and		10 *CFR* 850.31(b)(2)
	Release is conditioned on the recipient's commitment to implement controls that will prevent foreseeable beryllium exposure.		10 *CFR* 850.31(b)(3)
	Before being released to another facility performing work with beryllium, must ensure that removal contamination level of equipment and other item surfaces does not exceed 3 µg/100 cm^2;		10 *CFR* 850.31(c)(1)
	Ensure equipment or item is labeled in accordance with 10 *CFR* 850.38(b); and		10 *CFR* 850.31(c)(2)
	Enclose or place in sealed, impermeable bags or containers to prevent the release of beryllium dust during handling or transportation.		10 *CFR* 850.31(c)(3)
	Used oil		
Management of used oil	Used oil shall not be stored in a unit other than a tank, container, or RCRA regulated unit.	Generation and storage of used oil, as defined in 40 *CFR* 279.1 [*OAC* 3745-279-01(A)(12)], that meets the applicability requirements of 40 *CFR* 279.10—**applicable**	40 *CFR* 279.22(a) *OAC* 3745-279-22(A)
	Containers and aboveground tanks used to store used oil must be in good condition (no severe rusting, apparent structural defects, or deterioration) and not leaking (no visible leaks).		40 *CFR* 279.22(b)(1) and (2) *OAC* 3745-279-22(B)(1) and (2)
	Containers and aboveground tanks used to store used oil and fill pipes used to transfer used oil into USTs must be labeled or marked clearly with the words "Used Oil".		40 *CFR* 279.22(c)(1) and (2) *OAC* 3745-279-22 (C)(1)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Management of used oil (continued)	Upon detection of a release of used oil to the environment, a generator must stop the release; contain, clean up, and properly manage the released used oil; and, if necessary, repair or replace any leaking used oil storage containers or tanks prior to returning to service.	Release of used oil to the environment—**applicable**	40 *CFR* 279.22(d) *OAC* 3745-279-22(D)
Transportation of used oil off site	Except as provided in paragraphs (a) to (c) of 40 *CFR* 279.24 [*OAC* 3745-279-24(A) to (C)], generators must ensure that their used oil is transported by transporters who have obtained EPA ID numbers.	Preparation of used oil for transport off site—**applicable**	40 *CFR* 279.24 *OAC* 3745-279-24
	Refrigeration equipment		
Disposal of refrigeration equipment	With the exception of the substitutes in the end uses listed in 40 *CFR* 82.154(a)(1)(i) – (vi), no person maintaining, servicing, repairing, or disposing of appliances may knowingly vent or otherwise release into the environment any refrigerant or substitute from such appliances.	Appliances that contain Class I or II substances used as a refrigerant—**applicable**	40 *CFR* 82.154(a)(1)
	De minimis releases associated with good faith attempts to recycle or recover refrigerants are not subject to this prohibition.		40 *CFR* 82.154(a)(2)
	No person may dispose of such appliances, except for small appliances, MVACs, and MVAC-like appliances, without: • Observing the required practices set forth in 40 *CFR* 82.156 and • Using equipment that is certified for that type of appliance pursuant to 40 *CFR* 82.158.		40 *CFR* 82.154(b)

State of Ohio construction-demolition debris			
Exclusions for disposal or reuse of construction and demolition debris, or "clean hard fill" [as defined in *OAC* 3745-400-01(E)]	Construction and demolition debris facility requirements do not apply to construction and demolition debris or clean hard fill used in one or more of the following ways: • Any construction site where construction debris and trees and brush removed in clearing the construction site are used as fill material on the site where the materials are generated or removed • Any site where clean hard fill is used, either alone or in conjunction with clean soil, sand, gravel, or other clean aggregates, in legitimate fill operations • Any site where debris is not disposed, such as where debris is reused or recycled in a beneficial manner, or stored for a temporary period remaining unchanged and retrievable.	Use of construction and demolition debris or clean hard fill at a site—**applicable**	*OAC* 3745-400-03
Disposal of construction and demolition debris	Shall be disposed of only in an authorized construction and demolition debris facility or solid waste disposal facility; by means of open burning if permitted as provided in *OAC* 3745-19; or by other methods provided such methods are demonstrated to be capable of disposing without creating a nuisance or health hazard, without causing water pollution, and without violating any regulations under Chapters 3745, 3704 or 3734.	Disposal of construction and demolition debris—**applicable**	*OAC* 3745-400-04(A) and (B)
Disposal of construction and demolition debris as "clean hard fill"	Clean hard fill consisting of reinforced or nonreinforced concrete, asphalt concrete, brick (includes but is not limited to refractory brick and mortar), block, tile, or stone shall be managed in one or more of the following ways: • Recycled into usable construction material • Disposed in construction and demolition debris or other waste facilities • Used in legitimate fill operations for construction purposes or to bring the site up to consistent grade, on the site of generation, or on a site other than the site of generation, pursuant to paragraph (C) of *OAC* 3745-400-05.	Use of clean hard fill (does not include materials contaminated with hazardous, solid, or infectious waste) to bring a construction site up to consistent grade—**applicable**	*OAC* 3745-400-05(A)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Disposal of construction and demolition debris as “clean hard fill” (continued)	Clean hard fill may be stored for a period of less than 2years. “Stored” means held in a manner remaining retrievable and substantially unchanged. Clean hard fill piled adjacent to a construction materials processing facility shall not be considered stored for more than 2 years if the pile is active, i.e., if clean hard fill material is added to and removed from the pile within a 2-year period.		*OAC* 3745-400-05(B)
AIR EMISSIONS			
	Fugitive air emissions		
Activities causing fugitive dust (particulate) emissions	Shall take reasonable achievable control measures to prevent particulate matter from becoming airborne. Reasonable achievable control measures shall include, but are not limited to, the following:	Fugitive emissions from transportation, land-disturbing, or building alteration activities located in areas identified in Appendix A to *OAC* 3745-17-08, except as exempted under *OAC* 3745-17-08(A)(3) — **relevant and appropriate**	*OAC* 3745-17-08(B)
	• Use, where possible, of water or chemicals for control of dust and in demolition of existing buildings or structures, construction operations, grading of roads, or the clearing of land		*OAC* 3745-17-08(B)(1)
	• Periodic application of asphalt, oil (excluding used oil), water, or other suitable chemicals on dirt or gravel roads and parking lots, materials stock piles, and other surfaces that can create airborne dusts, or the use of canvas or other suitable coverings for all materials stockpiles and stockpiling operations except temporary stockpiles		*OAC* 3745-17-08(B)(2) and (6)
	• Install and use hoods, fans, and other equipment to adequately enclose, contain, capture, vent, and control the fugitive dust at the point(s) of capture to the extent possible with good engineering design. Equipment must meet the efficiency requirements of *OAC* 3745-17-08(B)(3)(a) and (b)		*OAC* 3745-17-08(B)(3)
	• Use of adequate containment methods during sandblasting or similar operations		*OAC* 3745-17-08(B)(5)
	• Cover, at all times, open-bodied vehicles when transporting materials likely to become airborne		*OAC* 3745-17-08(B)(7)

Table F.2. ARARs and TBC Guidance for the Site-wide Waste Disposition Evaluation Project Off-Site Disposal Alternative at PORTS, Piketon, Ohio (Continued)

Action	Requirements[a]	Prerequisite	Citation
Activities causing fugitive dust (particulate) emissions (continued)	• Pave and maintain roadways in a clean condition and • Promptly remove, in such a manner as to minimize or prevent resuspension, earth or other material from paved streets onto which this material has been deposited by trucking or earth moving equipment or erosion by water or other means.		*OAC* 3745-17-08(B)(8) *OAC* 3745-17-08(B)(9)
	Air emissions from a stationary source		
Activities causing release of air pollutants	Shall not cause the emission or escape into the open air from any source or sources whatsoever of smoke, ashes, dust, dirt, grime, acids, fumes, gases, vapors, odors, or any other substances or combinations of substances in such manner or in such amounts as to endanger the health, safety, or welfare of the public, or cause unreasonable injury or damage to property.	Activities causing the release of air pollution nuisances as defined in *OAC* 3745-15-07(A)—**applicable**	*OAC* 3745-15-07
	The operation of a hazardous waste facility shall not cause, permit, or allow the emission there from of any particulate matter, dust, fumes, gas, mist, smoke, vapor, or odorous substance that unreasonably interferes with the comfortable enjoyment of life or property by persons living or working in the vicinity of the facility or that is injurious to public health.	Site where hazardous waste will be managed such that air emissions may occur—**applicable**	*ORC* 3734.02(I)
Airborne radionuclide emissions	Emissions of radionuclides to the ambient air from DOE facilities shall not exceed those amounts that would cause any member of the public to receive an EDE of 10 mrem per year.	Radionuclide air emissions to the ambient air from DOE facilities—**applicable**	40 *CFR* 61.92

The purpose of this appendix is to evaluate disposal landfill subsidence avoidance process options to support the technology screening phases of the Feasibility Study (FS) for the decontamination and decommissioning (D&D) of the large radiologically contaminated equipment in the process buildings and the FS for the waste disposition decision at the Portsmouth Gaseous Diffusion Plant (PORTS) in Piketon, Ohio. Radiologically contaminated process equipment is expected to represent the highest radiological hazards to PORTS workers and off-PORTS receptors during D&D. However, as a result of their design, they may also represent a significant technical issue for proper design and operation of disposal facilities because of the large void fractions internal to the equipment. This evaluation is conducted in the event that waste acceptance criteria (WAC) require the generating projects to control void spaces in or degradation of their waste to mitigate long-term subsidence. This document addresses subsidence avoidance process options for the process equipment and is primarily oriented toward converters and compressors. Both the waste disposition and process building FSs will use results from this study.

G.1. INTRODUCTION

The U.S. Department of Energy (DOE) is evaluating waste disposition options for up to 1.47 million cy of primarily low-level (radioactive) waste (LLW) anticipated to be generated at the PORTS Facility[1]; 272,000 cy of this volume is process gas equipment. This analysis only addresses the volumes of major equipment from the X-330 and X-333 Buildings that are assumed for on-Site disposal (219,000 cy, of which 154,000 cy are process converters). These converters are assumed in the overall evaluation to be segmented and the nickel removed for future disposition; however, the original in situ volume of 154,000 cy is used for this analysis. Another 53,000 cy (approximately 24 percent) are compressors from the X-330 and X-333 buildings, and 12,000 cy (5.5 percent) are other process gas equipment from these buildings (surge drums and recycle coolers). These three components represent one of the largest, and the most highly contaminated, waste streams requiring disposal under this remedial action.

G.2. SCOPE AND OBJECTIVES

The gaseous diffusion enrichment process equipment is among the largest waste streams expected to be disposed in a potential on-Site disposal cell (OSDC), and the anticipated waste volume for on-Site disposal is approximately 219,000 cy of original equipment. The designs of the process equipment result in significant internal voids. The radioactive contamination inside the equipment and the size of the equipment present a technical challenge, if the disposal facility requires that the disposed waste be controlled in some fashion to control subsidence at the disposal facility. This study evaluates process options to avoid subsidence at a potential OSDC. These options involve eliminating the void space by destructing the equipment, filling the voids in the equipment with a suitable material, or protecting the equipment from corrosion and subsequent degradation. This study does not address options that could be applied to OSDC design or operation to address subsidence concerns.

As remedial decisions, cell design, the WAC, and characterization information matures into a final plan, it is expected that different process options may be selected or not even be needed. This study identifies the representative process options that will be used in the FSs to allow a consideration of the impacts such a requirement may impose.

---

[1] These waste volumes represent uncontainerized waste with no adjustments for expansion or compaction.

The following addresses the initial scope assumptions for this evaluation. Equipment considered is as follows:

- X-330 converters and compressors-Though the converters will be disassembled and segmented to recover the nickel, the original in situ volume will be included in this analysis for comparison of alternatives.
- X-333 converters and compressors-Though the converters will be disassembled and segmented to recover the nickel, the original in situ volume will be included in this analysis for comparison of alternatives.
- Size reduction of process piping will not be evaluated. It will be demolished with the building and size-reduced with the other building steel.
- Other process equipment (e.g., recycle coolers and surge drums) is similar to the converters and compressors so that subsidence avoidance process options can be extrapolated to them.

If any process gas equipment requires disassembly to remove materials, then the logical process at that point is to continue and segment the equipment into pieces to prevent voids during disposal.

Table G.1 describes the quantities of process equipment being evaluated in this document.

Table G.1. Process Equipment at PORTS

Building	Equipment	Type (Designators)	Quantity[1]
X-333	Converter	X-33 or 000	652
	Compressor	X-33 or 000	655
	Recycle Coolers	000 Trane and Koven	82
	Surge Drums	8 ft × 40 ft and smaller	44
X-330	Converter	X-31 or 00 Sizes 4/5/7	511
	Converter	X-29 or 0 Sizes 0 thru 5	621
	Compressor	X-31 or 00	509
	Compressor	X-29 or 0	600
	Recycle Coolers	000 or 00 York	52
	Recycle Coolers	0 2X	60
	Surge Drums	8 ft × 40 ft (and smaller)	82

[1] Quantities are from Mass Flow Commodity Quantities. Some quantities are uncertain because the specific types for spare equipment are not known.

Table G.2 provides the nominal weight and installed volume of each component.

Converters consist of a nickel-plated steel shell with one inlet process pipe, two outlet process pipes, a finned copper tube cooler with smaller inlet and outlet pipes, and the barrier bundle. The barrier bundle consists of a flow transition (aluminum sheet), tube sheets (nickel-plated steel), a center tube (nickel-plated steel), and thousands of barrier tubes (porous nickel). The readily accessible voids are the inlet and outlet pipes around the outside of the cooler and the outside of the barrier bundle. Inaccessible voids are inside the flow transitions, barrier tubes, cooler tubes, and the cooler inlet and outlet pipes.

Table G.2. Parameters of Process Equipment at PORTS

Building	Equipment	Type (Designators)	Component Weight (lb) Each	Component Volume (cy) Each
X-333	Converter	X-33 or 000	67,514	152.1
	Compressor	X-33 or 000	37,552	57.8
	Recycle Coolers	000 Trane and Koven	8,211 average	19.6
	Surge Drums	8 ft × 40 ft and others	17,347	67.5
X-330	Converter	X-31 or 00 Sizes 4/5/7	21,561	55.0
	Converter	X-29 or 0 Sizes 0 thru 5	16,656	42.7
	Compressor	X-31 or 00	14,152	28.2
	Compressor	X-29 or 0	14,835	28.2
	Recycle Coolers	000 or 00 York	8,403	5.2
	Recycle Coolers	0 2X	2,900	5.2
	Surge Drums	8 ft × 40 ft and others	17,421	67.9

Note:
Parameters are from Mass Flow Commodity Quantities.

The compressors in X-330 and X-333 are axial flow and consist of a nickel-plated steel shell that has an inlet nozzle, a compressor body with a side inlet nozzle, and a discharge nozzle. Inside the shell is a stationary compressor stator (aluminum) with aluminum blades; a rotor (nickel-plated steel) with aluminum blades mounted on a rotating shaft. The rotating shaft penetrates the shell where two compressor seals form a barrier from the outside. The accessible voids in the compressor are the space between the stator and shell, the space between the rotor and stator where the blades are, and all of the nozzles. The inaccessible voids are the interior of the rotor and the ends of the rotor adjacent to the seals.

Recycle coolers are a nickel-plated steel shell with an inlet and outlet process pipe and a copper-finned tube cooler with smaller inlet and outlet pipes. The accessible voids are inside the shell and process inlets. The inaccessible voids are inside the cooler tubes and the cooler inlet and outlet pipes.

Surge drums are nickel-plated steel tanks with inlet and outlet process pipes. The interior is empty and all voids are accessible.

Table G.3 presents a summary of the void spaces in the various process equipment items being evaluated in this study.

The void fractions above are conservative for two reasons. First, some components’ volumes are determined here by simple maximum length, width, and height, and do not take into account irregularities and dimension changes that would reduce the volume. Second, some items inside the equipment (e.g., cooler tubes, impellers, bellows) may have the materials of construction (e.g., exterior nickel plating, aluminum, monel) and structural integrity to withstand the disposal facility stresses without collapse, and thus could potentially be exempted from any future potential requirement for void filling in the WAC.

Table G.3. Void Space in Process Equipment at PORTS

Building	Equipment	Type (Designators)	Void Fraction (%)
X-333	Converter	X-33 or 000	96
	Compressor	X-33 or 000	88
	Recycle Coolers	X-33 or 000	97
	Surge Drums	8 ft × 40 ft	98
X-330	Converter	X-31 or 000	95
	Converter	X-29 or 00	96
	Compressor	X-31 or 00	90
	Compressor	X-29 or 0	90
	Recycle Coolers	000, 00, or 0	93
	Surge Drums	8 ft × 40 ft	98

G.3. PROCESS OPTION DESCRIPTIONS

Subsidence avoidance process options are grouped: (1) segmenting the equipment uniquely or prior to a secondary treatment step to make the equipment void disappear (all surfaces available for fill placement), (2) filling the equipment voids with material compatible with potential future WAC of the disposal facility, or (3) protecting the equipment from degradation for the design life of the facility. Segmentation process options before or during demolition include:

- Cutting into pieces/shapes capable of bulk disposal
- Shearing into pieces/shapes capable of bulk disposal
- Cutting or disassembling to fit into a compactor to prevent subsidence
- Cutting or disassembling to fit into a shredder to prevent subsidence
- Cutting or disassembling to fit into a melter to prevent subsidence.

Void-filling process options to prevent subsidence without segmentation include:

- Foaming with an approved dense foam in situ, at a intermediate foaming station, or at the disposal facility

- Sand or other dry solid media fill at the disposal facility

- Low-density grout fill at the disposal facility.

Subsidence avoidance process options to prevent subsidence through corrosion inhibition include:

- Surrounding the equipment with concrete fill
- Applying corrosion resistant external fixatives.

G.3.1 COMMON ELEMENTS

During the evaluation of these various options, there are some common elements that will be part of the cost estimate to give an accurate reflection of program-level cost impacts. In all cases, some equipment cutting is needed prior to removal of hold-up material or to remove the equipment from the buildings. Then a capping process is used to prevent the spread of contamination after cutting. Finally, the equipment is moved to a shop for further segmentation, a storage area for additional subsidence avoidance efforts, or the disposal facility where some subsidence avoidance efforts may be used. The following process option discussion highlights the common elements that are used in the cost estimate for each subsidence avoidance process option.

Air carbon arc cutting, previously known as air arc cutting, is an arc-cutting process where metal is cut and melted by the heat of a carbon arc. Molten metal is then removed by a blast of air. It employs a consumable carbon or graphite electrode to melt the material, which is then blown away by an air jet. It is the current method used at PORTS to remove equipment that has welded flanges.

Plasma is a process used to cut steel and other metals of different thicknesses (or sometimes other materials) using a plasma torch. In this process, an inert gas (in some units, compressed air) is blown at high speed out of a nozzle; at the same time an electrical arc is formed through that gas from the nozzle to the surface being cut, turning some of that gas to plasma. The plasma is sufficiently hot to melt the metal being cut and moves sufficiently fast to blow molten metal away from the cut. Plasma is currently used at PORTS for cutting pipe and welds where reinstallation preparation will be needed.

Oxy-acetylene is a process that uses a cutting torch to heat metal to kindling temperature. A stream of oxygen is then trained on the metal. The metal burns in that oxygen and then flows out of the cut as an oxide slag. This process requires both fuel and oxygen tanks. It cuts at approximately the same speed as arc air, but tank change outs result in a lower effectiveness. Slag, gases, and fumes are also considerable. Historically, oxy-acetylene cutting has been used extensively in cutting operations at PORTS, although less often on process equipment.

Mechanical cutting is a process where machinery (e.g., circular or reciprocating saws) is used to cut out equipment. Localized heating is much less than with hot cutting. It is much slower than hot cutting, and the in-hand equipment is much heavier for manual cutting (mechanized setup and cutting is generally not feasible for gaseous diffusion equipment). Shards are minimal and gases and fumes are nonexistent. Mechanical cutting was used on the smaller K-25 equipment and piping in Oak Ridge, Tennessee, where limited equipment and piping were removed prior to demolition.

Plastic (3 to 7 mil thickness) and duct tape for capping of openings after cutting are most often used when contamination control is desired. There are minimal security concerns, and no structural strength is required for air or fill pressure on the opening. It is the most common method of capping currently employed at PORTS.

Sheet metal (14- to 18-gauge thickness) and two-part epoxy are used for capping when contamination control is required and some security concerns exist. Oftentimes, duct tape or clamps are used to allow setting of the epoxy. Generally, this process option is not applicable for grout or sand fill pressures on the openings, but it has been successfully used in sealing for foaming operations. This method was used at the K-25 D&D Project in Oak Ridge.

The addition of a plate (1/8 to 1/4-in. thickness) with tack or seam welds is used to provide contamination control, security, and/or fill pressure effectiveness. In some instances, clamps and/or gaskets can be substituted for the welds. Large diameter plates may also require stiffening beams to withstand fill pressures. This method is currently in use at PORTS for sealing of equipment for security requirements or for subsequent pressurization of equipment.

Some segmentation and subsequent mining may occur to comply with a numerical or safety-based WAC. Converters would be removed by cleared workers, capped with plastic and duct tape (sheet metal or plates may be required if uncleared movers are employed), and moved by cart to the decontamination area. In a secure facility, special carts are employed to cut loose and hold the inlet head and outlet head with the cooler assembly. Then the barrier bundle is extracted from the center shell and the transition is removed. The heads and shell are inspected to determine if holdup is present. If holdup is present (not considered likely), then the subassemblies are moved for mechanical or wet decontamination of holdup.

Compressors may have the compressor seals removed in the process buildings before compressor removal by cleared workers, any visible holdup is removed from the seal cavity, and the cavity is sealed with a special bolted plate or sheet metal around the shaft. In situ nondestructive assay (NDA) may then be conducted to determine if further material removal is still required. If necessary, the compressor is then removed from the cell by cleared workers, closed with plastic and duct tape, and removed from the process building onto a cart. Uncleared workers transport the compressor to the decontamination area. The inlet and discharge nozzles are removed, and the rotor and stator are removed from the compressor body. Visible holdup is removed by mechanical scraping or by wet decontamination.

G.3.2 SEGMENTATION SUBSIDENCE AVOIDANCE OPTIONS

The segmentation subsidence avoidance options are as follows:

Segmentation to a Small Size. This process option uses the cutting techniques discussed above to continue disassembly of the equipment to remove material sufficiently to meet the WAC of a disposal facility. In this process option, future potential WAC are met by reducing the size of the residual pieces of the equipment. In general, pieces of waste no larger than 4 ft in length are anticipated.

Shearing In Situ. Shearing is used to significantly avoid subsidence by cutting equipment and piping in the field. It also crushes the equipment together to some extent and achieves some further void reduction in this manner. Special equipment is required to shear process equipment of this size, and this can result in a technology limitation because of the size of tracked equipment that can be effectively used. Shear throat sizes of 18 to 24 in. are achievable, and designs that punch through equipment metal to allow cutting in the throat can be obtained. This process option was successfully used to shear smaller diameter process piping (up to 12-in. diameter), centrifugal compressors, and structural steel during demolition of the K-25 Building in Oak Ridge.

Compaction. Compaction is often coupled with an initial shear or segmentation to facilitate the process. This process option was successfully used by British Nuclear Fuel Limited (BNFL) in the processing and disposition of process equipment from the K-29, K-31, and K-33 buildings in Oak Ridge. Compaction opening size (throat) and high efficiency particulate air (HEPA) filtration are factors affecting cost and operations, as well as the need for separate compactors if classified components are to be processed. Delivery of the subassemblies or sectioned subassemblies to the compactors requires additional movement equipment (carts, conveyors, or wheeled handling equipment). Compacted materials require transfer to conveyances, depending on the requirements of the disposal path, perhaps requiring additional movement equipment. Most of these conveyances become weight-limited rather than volume-limited for transportation. Not all equipment or subassemblies benefit from compaction.

Shredding. Equipment subassemblies could be fed to commercial shredders specially modified to handle radioactive materials by the addition of HEPA filters and ductwork to control airborne contamination. Equipment cost is primarily a factor of shredder opening size (throat) and power (metal types and thicknesses). Larger throat sizes require higher capacity HEPA filtration, so there is a tradeoff between shredder size and the need to further segment subassemblies, although perhaps not to the extent for waste packaging/void avoidance. Security concerns may also require a minimum of two shredders to process the classified waste separately from the remainder of the process equipment. Delivery of the subassemblies or sectioned subassemblies to the shredders requires additional movement equipment (e.g., carts, conveyors, or wheeled handling equipment). Shredded materials are collected in hoppers and require transfer to conveyances, depending on the requirements of the disposal path. Not all subassemblies benefit from shredding. Curved steel plate may actually result in fewer voids than shredded plate. Cooler and barrier tube shredding would reduce the voids for these subcomponents. Although separated from the equipment, they meet the future potential WAC of the disposal facilities because of their small diameters.

Melting. This process option eliminates voids in the equipment and produces ingots that are volumetrically contaminated. As with the other process options, melters require some additional segmentation of subassemblies so they can be placed in the melter. At the melter, special handling equipment is necessary to load and unload them. Slag (more highly contaminated) is either added to the melted material or segregated as a separate waste stream. After cooling, the ingots are placed into conveyances, depending on the requirements of the disposal path. Most of these conveyances would become weight-limited rather than volume-limited for transportation.

G.3.3 SUBSIDENCE AVOIDANCE WITHOUT SEGMENTATION AND SIZE REDUCTION (VOID FILLING)

Subsidence avoidance without segmentation or size reduction occurs through the introduction of inert materials of sufficient strength to withstand disposal facility waste and cap pressures after the process equipment external shell has degraded (oxidized) to the point that structural integrity is lost. The amount of necessary subsidence avoidance is a function of the design and future WAC at the disposal facility. This is still indeterminate for any potential OSDC. Using the component weights and volumes in Table G.2 and assuming all materials are the density of steel, rough total void fractions are provided in Table G.3. If needed, these void fractions will be refined with more accurate weight and volume determinations, based on materials of construction in the D&D design phase. However, for now, they are conservatively suitable for process option discussions concerning subsidence avoidance.

Three media are considered for void-filling of the PORTS process equipment, low-density grout, dry sand, or high-strength foam. Of the three, only the foam option is considered feasible for all of the equipment at a location remote from the disposal facility because of the weight gains associated with the other process options. Introduction of sand and grout is assumed to occur at a potential OSDC. The three media and their use are described in the following paragraphs:

High-density Foam. High-density foam such as isocyanate foams can be used to fill the voids in the process equipment. These foams are injected as two relatively nonviscous liquids that rapidly react and expand into a hard, solid matrix that has a density of approximately 135 lb/cy. Foaming requires commercial foam injection equipment, and injection occurs in nominally 2-ft lifts to allow the material below to react and harden. The injection equipment is portable, and hoses with mixing guns are used to inject the foam. The liquids are generally supplied in drums or slightly larger totes, which are delivered by truck or forklift. As with the grout (and sand), the same numbers of holes or ports are used for introduction, the viscosity prevents some voids from being reached (although the expansion does assist), the converter security requirements remain, and contamination control with HEPA is likewise needed.

Foaming at the point of generation is a possibility because of the relatively low weight density, the equipment required, and the method of introduction. During the K-25 Building D&D, it was successfully used in the cell enclosures for void reduction in Size 3 and 4 converters (nominally the size of the X-326 converters). Two sub-options are foaming after cutting and capping the process equipment and foaming before cutting and capping. Because of combustibility, foaming cannot be used where hot cutting techniques are employed. Therefore, if foaming occurs before cutting the equipment, piping is foamed also and mechanical cutting becomes the only alternative for removal. Foaming also has nuclear safety analysis ramifications. If a building fire is a credible nuclear accident scenario, one of the foam components is combustible, and this could cause a limit to the amount of foam inventory allowed in the facility. The operations and equipment may also be subject to nuclear safety controls dictated by the analysis.

Sand. Sand may be used from the top to fill the voids in the process equipment. Dry sand has a nominal density of 2,700 lb/cy and flows into a relatively compact form that does not compress or settle significantly. In order to introduce the sand, all openings in the process equipment must be capped with plates capable of withstanding static pressure from the sand during curing, which can be several hundred pounds per square foot of opening. This generally requires the welding-on of steel plates, or they can be tack-welded or clamped with compressed gaskets. This is assumed to occur during equipment removal from the process buildings. Three types of sand introduction are possible, gravity pour, augered, or pumped. This requires openings or ports on the top (or side near the top) of the equipment at each location where the equipment is sectioned off by the internal components. The sand introduction phase may require some method of contamination control to prevent airborne contamination from exiting the opening and contaminating the equipment or personnel. Generally, this is provided by localized portable HEPA systems. Security controls and cleared workers are also required when accessing a converter for the introduction of sand. Sand may be added at a disposal facility transfer area, at the disposal area face, or inside the disposal area. Each of these options is feasible, but adding sand outside of the disposal area requires heavy duty carts and cranes or other heavy lifting equipment to place the equipment. Sand filling is expected to be slower than grout introduction, and it is not expected to fill as much void space as grout. Dry sand does pose a storage problem prior to use, and silica can be a worker health hazard. An alternative to sand introduction at the potential OSDC could be preparation of the equipment so sand or compact gravel could be placed in its voids after placement of the equipment in the disposal facility. While this is not a viable process option for converters or centrifugal compressors, it could be employed by placing axial compressors with their nozzles in the vertical position, filling around the body, and then filling the nozzles with sand or gravel that will self-compact. A similar technique may be applicable to some models of the recycle coolers.

Low-Density Grout. Grout with a sufficient compressive strength to meet future potential WAC requirements could be introduced into the tops of the process equipment to fill voids. Generally, grout densities of 500 to 3,000 lb/cy can be formulated to provide strengths equal to or greatly exceeding 50 lb/sq ft. Robust opening caps are needed, as with sand, and the security concerns and need for cleared workers remain. The methods of movement or introduction at the disposal facility remain as with the sand. Once again, HEPA ventilation for contamination control may be required. Mixtures with low viscosity can be produced to maximize infiltration of voids. Grout could be mixed at PORTS or purchased for delivery. On-PORTS mixture requires materials storage, expertise in mixing equipment and technology, procedures, and quality assurance programs. Grout filling has been successfully used for some equipment (e.g., centrifuge casings) at the Environmental Management Waste Management Facility in Oak Ridge.

G.3.4 SUBSIDENCE AVOIDANCE THROUGH CORROSION INHIBITION

The design of the process equipment is expected to be able to withstand the soil pressures of the disposal facility without significant deflection or subsidence, although this will have to be technically verified.

The process equipment exterior surfaces are mild steel and will be subject to oxidation corrosion and slow structural degradation, eventually resulting in deflection and subsidence. If this corrosion could be arrested for the life of the disposal facility, then subsidence of the cap could be avoided. Based on highway structure designs and testing, two methods of significantly arresting mild steel corrosion is immersion in concrete rubble or application of noncorrosive protective coverings to the steel. These two process options are described as follows:

Surround with Concrete Fill. This process option can be performed if a supply of concrete fill is available during placement of the process equipment. Depending on how the equipment is placed in the disposal facility, approximately 100,000 to 150,000 cy of concrete fill would be necessary to surround the 219,000 cy of process equipment (assuming all placed without void reduction). Placement would begin with a lift of concrete fill; then placement of the process equipment; then buildup around the equipment with concrete fill, eventually filling up, over, and between the equipment with concrete; and finally a compacted lift of concrete fill above the equipment so another layer of equipment could be placed.

Corrosion-Resistant Exterior Fixatives. Fixatives similar to those used in highway structure designs could be applied to the exterior of the process equipment, forming an impervious barrier to moisture and oxidation of the steel. Application would be by brush or spray, depending on the thickness of application. Normal waste fill or procured fill could then be placed around and between the equipment as with the previously discussed concrete fill.

G.4. PROCESS OPTION EVALUATION DISCUSSION

The following discussion evaluates the effectiveness, implementability, and cost of the various subsidence avoidance process options. Effectiveness evaluates the capability of the process option to reduce disposal facility subsidence through elimination of void from the process equipment, reducing the void in intact equipment by filling it to the extent reasonable with a material that can withstand disposal facility fill pressures, or protecting the equipment from oxidation and subsequent structural degradation. Implementability addresses maturity and acceptability of the processes in comparison to current equipment, facilities, and resource experience. It highlights any significant implementation challenges or schedule impacts. It also addresses the impact of the process option on the size of the disposal facility. Health and safety issues are also discussed under implementability.

The cost evaluation presents capital costs of the entire process equipment removal, treatment, and transportation effort for on-Site disposal, including the cost of the subsidence avoidance process option. Disposal costs assuming on-Site disposition are included. The cost estimates are used only for technology screening and are not used in the detailed analysis of alternatives. More detailed estimates are used at that phase of the project. The first cost estimate on segmentation is considered the baseline case, and it assumes removal and size reduction of the X-330 and X-333 converters and compressors. Estimates from other studies have been used as available, either directly or parametrically, for the changes to each estimate brought about by differing subsidence avoidance process options. If no existing estimates exist, then an estimate has been formulated and the basis of the estimate is documented.

G.4.1 SEGMENTATION TO SMALL SIZE

Segmentation Effectiveness – Good. Disassembly and cutting up of the process equipment renders the equipment very similar to the size reduced steel waste from building demolition (e.g., structural steel, nonprocess piping) and allows it to be dumped and placed in a manner similar to that of the building waste in a potential OSDC. As with building waste, it allows mixing at the disposal point with either soil,

soil-like waste (e.g., rubblized concrete, roofing materials), or fill to meet landfill requirements. Similar to other building waste, there would be short lengths of intact tubing and curved steel surfaces that might cause localized voids (depending upon final orientation), but these would be dispersed through the disposal facility with the other waste. Thus, differential subsidence because of localized large voids would not occur.

Segmentation Implementability – Good. Existing equipment, procedures, and resources have been used to perform very similar work at PORTS in the recent past during pre-D&D activities in the X-705, X-700, and X-720 buildings. These existing buildings, and the existing processes and equipment they contain, are considered viable for executing this process option and likely represent the process option with the least impact to starting work. This process option is planned to be used to remove material from the interior of process equipment to meet the numerical WAC of any disposal facility, or to meet transportation limits for off-Site transport. Thus, this process option is expected to be implemented for some of the process equipment without respect for subsidence avoidance. It does allow segregation and reduction of classified materials, reducing the impact and size of this unique waste stream.

Segmenting the equipment is expected to reduce the total volume of process equipment waste in the cell from approximately 219,000 cy (the equipment volume for X-330 and X-333 converters and compressors) to approximately 60,000 to 70,000 cy, or perhaps less (i.e., about a 12 percent reduction in total waste volume for D&D). The 219,000 cy excludes the intact X-326 converters and compressors.

The major issue with segmenting the process gas equipment is that the removal, moving, and processing of all the equipment (piece-by-piece) is very labor-intensive and slow. It may impact the overall D&D schedule (likely it would be critical path to process building D&D startup). The size of the equipment and a significant contamination exposure potential for workers during removal and size reduction all contribute to potential safety issues for the workers. Processing the equipment requires double handling (movement and lifting) of the equipment and causes significant security concerns in dismantling and handling the classified components in the equipment. Staging areas would be required for classified and unclassified equipment and processed waste containers. Depending on the final sizing of the waste, new fixtures, containment systems, and movement equipment may need to be designed and fabricated.

Segmentation Cost. The costs for this process option are reasonably well understood, given that it has been estimated using the methods used for estimating the FS alternatives. The major costs of the segmentation-to-small-size process option are as follows:

1. Removal (X-330 and X-333 equipment)	$38.0 million
2. Movement (X-330 and X-333 equipment)	$5.7 million
3. Disassembly and segmentation systems (X-330 and X-333 equipment) capital and operating cost	$123.5 million
4. Disposal facility capital and operating cost (including trucking) for 66,000 cy	$59.7 million
Total Capital Costs	**$226.8 million**

G.4.2 SHEARING IN PLACE

Shearing Effectiveness – Good. Shearing is applicable only to compressors after the seals are removed. Converters cannot be sheared at the demolition location because of classification issues, and they must be processed using one of the other process options (assumed for this analysis to be disassembly and segmentation). Shearing with machine-mounted equipment during demolition results in metal waste for disposal that is similar to the size-reduced structural steel of the buildings. This process option is somewhat superior because curved surfaces can be flattened and metals generally can be bent into more compact or conforming shapes, depending on the amount of processing in the field.

Shearing Implementability – Excellent. Shearing of the compressors involves a much less labor-intensive approach than segmentation and the process options discussed below because of its dependence on heavy equipment. Shearing of the process equipment would use essentially the same mobile heavy equipment and shears used to process structural steel and would let the majority of the size-reduced process equipment be mixed with the building waste for shipment. This process option could reduce the labor and time (perhaps significantly) for cutting and removing the compressors from the field because it could occur during building demolition and use the same equipment. This could result in an earlier start of building demolition because process equipment removal and processing is expected to be the critical schedule driver of process building D&D. Shearing has a significant safety benefit. It removes many workers from the safety risks of cutting, moving, and segmenting the compressors. This process option would not be applicable to converters from X-330 and X-333. Because of security concerns, they would have to be segmented into disposable waste without the benefit of field shearing.

Implementing this process option during demolition would result in compressors being pulled down from the elevated cell floor along with all of the process piping and nonprocess equipment, piping, and structural steel. The primary concern is loss of contamination control and the potential spread of contamination through the storm drain system or dust migration. Commingling of these wastes is not expected to affect waste disposal, as both the process equipment and the structures are currently expected to be treated as LLW. Whether the process equipment is present or not, dust suppression techniques would be employed during demolition. Shearing of process equipment on the demolition location does increase the risk of contaminant migration to storm water. This technique was used during the K-25 Building west wing demolition, but with equipment foamed for contamination control and controlled shearing of process equipment. Also, storm water retention and storm grate filtration were employed for both particulate and contaminant control, although building radioactivity was not detected in either the storm water or the storm grates. No violations of storm water management requirements occurred because of radionuclide transport. There were pH violations resulting from incorrect gravel placement. This is attributed in part to the large amount of concrete from the structure, which tended to immobilize any radioactive contamination flowing from the demolition area in surface waters.

In order to implement this process option, a fixative to immobilize the majority of residual internal contamination in the compressors is conservatively assumed to be necessary. Contamination fixation technologies such as CCFix® or CCWet® could be employed to spray accessible sections of the compressors after cutting from the process piping. Application techniques would have to be developed, but at present, it is assumed that the number of cuts could be reduced from the amount needed during implementation of the segmentation process options. Additional access holes for the compressors would be necessary to allow the maximum feasible coverage inside the equipment.

Shearing of the compressors (with segmentation for the converters) is expected to reduce the total volume of process equipment waste in the cell from approximately 219,000 cy (as is equipment volume) to approximately 60,000 to 70,000 cy, or perhaps less, waste truck volume (i.e., about a 12 percent reduction of total waste volume for D&D). For this analysis, it was assumed that the compressors would be sheared to the same extent that converters are segmented in the segmentation shop (a volume reduction factor of 3.3).

Shearing in place at PORTS is a new process option, at least for the large process equipment D&D, which would require specialty fabrication of shearing fixtures, equipment operations training, readiness evaluation, and new procedures for safety and quality documentation.

Shearing Cost. Costs for this process option are based on shearing efforts implemented with the building structure demolition shearing (with a percentage increase to the average for the heavier work). This process option is considered to be well developed, consisting of techniques used in other contaminated D&D projects throughout the country. The major costs of shearing in place of compressors and using segmentation for removed converters are as follows:

1. Removal (X-330 and X-333 converters) and fixing with CCFix® (X-330 and X-333 compressors)	$41.1 million
2. Movement (X-330 and X-333 converters)	$4.0 million
3. Disassembly and segmentation systems (X-330 and X-333 converters) capital and operating cost	$90.5 million
4. Shearing of X-330 and X-333 compressors in place	$8.5 million
5. Disposal facility capital and operating costs, including trucking for 66,000 cy	$59.7 million
Total Capital Costs	**$203.7 million**

G.4.3 COMPACTION

Compaction Effectiveness – Very Good, Slightly Superior to Segmentation. Compaction starts with the same process of disassembly and segmentation as the baseline process option, but only segments to the point the waste can fit into the compactor(s). This process option is superior because curved surfaces are flattened, tubing is flattened or crushed, and metals are generally bent into more compact or conforming shapes. Compaction was successfully used on the K-31 and K-33 equipment removal project in Oak Ridge.

One uncertainty is the loss of compaction during placement in the disposal facility. Crushed groupings of metal may separate to some extent, depending on the equipment used to place the waste in the disposal facility (e.g., bulldozers). Also, tightly packed groupings may affect the ability to surround them with soil-like waste or fill. This could be exacerbated if bulldozer placement of waste is used, less so with front end loader placement. But if this process option is extensively used, then the suspected subsidence avoidance is expected to be quite uniform and significantly less than placement of whole equipment.

Compaction Implementability – Fair. This process option relies significantly on the disassembly and segmentation process option for implementation. It has one process advantage. Depending on the compactor design, it could somewhat reduce the segmentation effort (although not disassembly). A compactor design with shearing capabilities, similar to the one used in the BNFL process, would reduce hot work cutting. Compaction does introduce an additional handling process to move the disassembled and partially segmented materials to the compaction operation.

This process option would not be applicable to converter bundles from X-330 and X-333. They would have to be segmented to disposable waste without benefit of compaction because of security concerns.

Use of compaction is expected to reduce the total volume of process equipment waste in the cell from approximately 219,000 cy (as is equipment volume) to approximately 40,000 to 50,000 cy, or perhaps less (i.e., about a 13 percent reduction of total waste volume for D&D).

Compaction is a new process option at PORTS, requiring design, fabrication, construction, testing and checkout, training, and readiness evaluation. New procedures, safety documents, and quality documents would have to be written. Safety risks would change and may actually improve, based on the BNFL success with compaction, over complete hot work segmentation of the equipment. There may be significant schedule delays for construction of the compactor and when the compactor is not operational.

Compaction Cost. Costs for compaction are reasonably well understood; components of which have been estimated by DOE in Critical Decision-1 for budgetary as well as regulatory purposes. The major costs of compaction with some segmentation are as follows:

1. Removal (X-330 and X-333 equipment)	$38.0 million
2. Movement (X-330 and X-333 equipment)	$5.7 million
3 Disassembly and segmentation systems (X-330 and X-333 equipment) capital and operating cost, including full size reduction of converter bundles	$120.1 million
4. Compaction capital and operating cost (including movement)	$15.3 million
5. Disposal facility capital and operating costs (including trucking) for 45,000 cy	$40.7 million
Total Capital Costs	**$219.7 million**

G.4.4 SHREDDING

Shredding Effectiveness – Very Good, Slightly Superior to Segmentation and Compaction. This process option is beneficial because large metal components are reduced to shards of metal that can be placed in a landfill, easily mixed with soil-like waste or fill, and compacted. The expected subsidence is expected to be quite uniform and significantly less than for placement of whole equipment.

The only detriment to the effectiveness of this process option is that the large plate steel in the equipment may actually increase in volume from the previous two process options. The significance of this increase is dependent on the shredded shard shape and size. Partial segmentation of the equipment is still needed prior to feeding the waste into the shredder.

Shredding Implementability – Fair. Shredding relies significantly on disassembly and segmentation, but only to the extent required to access the shredder(s). Shredding could, depending on the shredder design, somewhat reduce the segmentation effort (although not disassembly). The shredder throat size would be crucial in determining the extent of segmentation required. This study assumes that some additional segmentation beyond that required for direct disposal is required for shredding.

This process option could be applicable to process converter bundles from X-330 and X-333. A smaller dedicated unit could be employed to shred partially segmented bundles and barrier to disposable waste. The shredding and landfill placement of this waste would require security controls (e.g., controlled processing area, sacrificial containers or supersacks, cleared workers).

As with compaction, shredding is expected to reduce the total volume of process equipment waste in the cell from approximately 219,000 cy (as is equipment volume) to approximately 30,000 to 40,000 cy, or perhaps less (i.e., about a 14 percent reduction of total waste volume for D&D).

Equipment shredding at PORTS is a new process option, requiring design, fabrication, construction, testing and checkout, training, and readiness evaluation. New procedures, safety documents, and quality documents would have to be written. Safety risks would change and are uncertain because of the additional handling and process steps that shredding would add. As with compaction, there is a potential for schedule delays resulting from design and construction of the facility and potential facility or equipment failure.

Shredding Cost. Costs for shredding are reasonably well understood. The capital and operating costs of the shredding operation have been evaluated as a recycling process option. The major costs of the shredding process option are as follows:

1. Removal (X-330 and X-333 equipment)	$38.0 million
2. Movement (X-330 and X-333 equipment)	$5.7 million
3. Disassembly and segmentation systems (X-330 and X-333 equipment) capital and operating cost	$126.9 million
4. Shredding capital and operating cost (including converter bundles)	$24.6 million
5. Disposal facility capital and operating cost (including trucking) for 35,000 cy	$31.6 million
Total Capital Costs	**$226.8 million**

G.4.5 MELTING

Melting Effectiveness – Excellent, Superior to Segmentation, Compaction, and Shredding. This process option is beneficial because large metal components are reduced to ingots that can be placed in a landfill, easily surrounded with soil-like waste or fill, and compacted. The expected subsidence avoidance is the ultimate that is achievable and significantly less than for placement of whole equipment. As with compaction and shredding, partial segmentation is needed prior to waste entering the melter.

Melting Implementability – Fair. Melting relies significantly on disassembly and segmentation and requires a significant new process option never utilized at PORTS. It starts with the same process of disassembly and segmentation as the baseline process option, but stops the segmentation at a point that depends on the size and capabilities of the melter(s) employed. As with the shredding, it is currently assumed that segmentation for melting would result in more cutting than the direct disposal alternative. The melter capacity/entrance size would be crucial in determining the extent of segmentation required.

This process option could be applicable to process converter bundles from X-330 and X-333 with the addition of security controls. A smaller dedicated unit could be employed to melt partially segmented bundles and barrier to disposable waste that has little or no security requirements.

Melting is expected to reduce the total volume of process equipment waste in the cell from approximately 219,000 cy (as is equipment volume) to approximately 10,000 to 20,000 cy (i.e., about a 16 percent reduction of total waste volume for D&D).

Equipment melting at PORTS is a new process option requiring design, fabrication, construction, testing and checkout, training, and readiness evaluation. New procedures, safety documents, and quality documents would be needed. Safety risks would change, but they are uncertain at this time because of the uniqueness of the process option and the additional handling and processing steps that melting would add. Depending on the design and operation of the melter(s), there is a risk of total or partial outages from unforeseen events. The risk of equipment failure is considered highest for this process option. Schedule risks and delays are also the highest for this process option because melter design and construction are anticipated to take several years.

Melting Cost. Costs for this process option are less certain, given the relatively new technology. The capital and operating cost of the melting operation has been evaluated as a recycling process option and has been reviewed. Specifically, the vacuum induction melting process option was used as a basis for a cost estimate. The major costs of the melting process option are as follows:

1. Removal (X-330 and X-333 equipment)	$38.0 million
2. Movement (X-330 and X-333 equipment)	$5.7 million
3. Disassembly and segmentation systems (X-330 and X-333 equipment) capital and operating cost	$130.4 million
4. Melting capital and operating cost (including converter bundles)	$325.1 million
5. Disposal facility capital and operating cost (including trucking) for 15,000 cy	$13.6 million
Total Capital Costs	**$512.7 million**

G.4.6 FOAMING

Foaming Effectiveness – Good. This process has the same effectiveness as grouting and is more effective than sand because of flowability. Foam is used by the K-25 D&D Project in Oak Ridge. Historically, it has effectively filled most of the void spaces in their process equipment, at least to the level required to meet a future potential WAC of the disposal facility. The foam does not appreciably enter the barrier and cooler tubes, and it does not reduce the process equipment volume in the disposal facility.

Foaming Implementability – Good. Foam is introduced after hot cutting of the process equipment to remove it from the building. Introducing foam before cutting would require mechanical cutting of the large process equipment to avoid a fire, but this is not considered to be feasible for the large equipment.

This process option has one advantage. It could allow compressor (but not converter) shearing during demolition, providing contamination control and allowing loading and movement with the other sheared building waste. Foam can also be introduced at the process buildings, which would avoid filling at the disposal facility. Lighter plates (or even sheet metal) could be used to seal the equipment after foaming, thus avoiding the heavier plates and attachment methods used with grouting and sand.

Foaming does not reduce the total in situ process equipment volume (219,000 cy) destined for the disposal facility.

Foaming Cost. Foam has some very significant material costs, although the capital cost of application equipment is considerably less than those for other process options. Costing for this process option assumes hot cutting of the equipment first. The costs also assume movement of the equipment to the disposal facility for burial without any further processing. The costs are as follows:

1. Cutting and removal and installation of plates, and foam injection and vent ports		$51.5 million
2. Foam in situ capital and operating cost		$145.2 million
3. Disposal facility capital and operating cost (including trucking) for 219,000 cy		$200.0 million
	Total Capital Costs	**$396.7 million**

G.4.7 SAND

Sand Effectiveness – Good. The introduction of dry, pourable, sand-like materials of sufficient structural strength into the equipment at the disposal cell would lessen subsidence upon equipment degradation and steel collapse. This process option, however, does nothing to reduce the overall process equipment volume placed in the disposal facility.

Sand Implementability – Good. The introduction of sand can occur during normal disposal facility operations, avoiding or minimizing additional moves for processing. The sand would be introduced at the disposal location because the weight of a sand-filled piece of equipment would make transport difficult. Sand filling is not as labor-intensive as the segmentation process options. It is applicable for both converters and compressors.

This process option has not been implemented during any DOE D&D activities, mainly because grouting process options have been considered to be superior because of flowability and weather considerations. Sand does require the installation of heavier plates to seal the equipment from the pressures of the sand. In addition, introduction of the sand requires the cutting of access ports in the equipment. Vent ports are also required, and contamination control filters must be attached. The sand needs to be kept dry, and implementing this process option would require covered storage areas and potentially dry weather operations only.

Placement of the equipment in the disposal facility could require additional equipment, depending on the location of the sand introduction. After placement, special efforts to fill and compact around the equipment would be necessary.

Sand Cost. Filling with sand has some significant material costs, but comparatively little capital cost for processing equipment. Costing for this process option assumes plates, pouring holes, and vent holes are installed during equipment removal. Placement would involve crane movement for the equipment. The costs are as follows:

1. Removal and installation of plates, and pouring and vent holes		$51.9 million
2. Sand capital and operating cost		$31.1 million
3. Disposal facility capital and operating cost (including trucking) for 219,000 cy		$200.2 million
	Total Capital Costs	**$283.2 million**

G.4.8 GROUTING

Grouting Effectiveness – Good. Introduction of grout materials with sufficient structural strength into the process equipment at the disposal cell would prevent subsidence indefinitely. This process option, however, does nothing to reduce the overall process equipment volume placed in the disposal facility.

Grouting Implementability – Very Good. Grouting can be implemented during normal disposal facility operations, and it could avoid or minimize additional equipment movement for processing. Grouting is not as labor-intensive as the segmentation process options. It is applicable to both converters and compressors.

Grouting does require the installation of heavier plates to seal the equipment from the pressures of the grout. Also, introduction of the grout requires the cutting of access ports in the equipment. Vent ports are also required, and contamination control filters must be attached. Cold weather grouting requires additional curing measures to assure solidification.

Placement of the equipment in the disposal facility could require additional equipment, depending on the location of the grouting. After placement, special efforts to fill and compact around the equipment would be necessary. Grouting operations at the disposal facility would also be somewhat weather dependent because grouting would cease during rain or snow events.

Grouting Costs. Grouting has some significant material costs, but comparatively little capital cost for processing equipment. Costing for this process option assumes plates, cutting of injection and vent holes during equipment removal, and grout injection (as opposed to gravity flow). Placement would involve crane movement for all equipment. The costs are as follows:

1. Removal, including installation of plates, injection ports, and vent ports	$51.9 million
2. Grouting capital and operating cost	$35.3 million
3. Disposal facility capital and operating cost (including trucking) for 219,000 cy	$200.0 million
Total Capital Costs	**$287.2 million**

G.4.9 SURROUND WITH CONCRETE FILL

Surround with Concrete Fill Effectiveness – Fair. The effectiveness of surrounding the process equipment with concrete fill is based on verification of two factors: (1) the ability of concrete fill to inhibit corrosion of the external steel surfaces for the design life of the disposal facility cap, and (2) the strength of the unfilled process equipment to withstand the structural pressures of the disposal facility. Surrounding with concrete does not reduce the total in situ process equipment and piping volume (219,000 cy) destined for the disposal facility.

Research shows that corrosion inhibition of concrete for oxidation of steel is significantly slower than for soils. If this slower reaction is more than a factor of 4 to 6, then it is possible for the process equipment encased in concrete fill to survive without rusting away and collapsing for the design life of the disposal facility cap.

Although the equipment strength would have to be confirmed with calculations, the cylindrical shapes of the major equipment are sufficiently similar to those of large corrugated piping (21 ft in diameter) tested at significant burial depths (up to 75 ft), which showed that the piping could potentially support the soil pressure with minimal deflection (< 5 percent) (Ohio Department of Transportation [ODOT] 2004).

Surround with Concrete Implementability – Fair. This process option's implementability is dependent upon a ready source of concrete fill, such as the concrete rubble from the process building floors and slabs. This presents a logistics problem because the process equipment would be available for burial and require staging in the process buildings well before the concrete is rubblized, at least for the first process building demolished. Concrete rubble from other demolished buildings could be used, but it would likely be deficient in quantity (nominally 10,000 - 25,000 cy would be required initially). It would also require a segregation effort to extract the concrete rubble from other D&D waste.

If available, this process option offers a direct equipment placement technique that avoids all specific processing and movements other than the initial logistics of obtaining sufficient concrete fill for placement around the equipment.

Surround with Concrete Costs. This process option has the second lowest capital and operating costs of all of the process options, assuming concrete fill is available. The costs are as follows:

1. Removal	$47.7 million
2. Concrete rubblization	$31.3 million
3. Disposal facility capital and operating cost (including trucking) for 219,000 cy	$200.0 million
Total Capital Costs	**$279.0 million**

G.4.10 CORROSION-INHIBITING EXTERNAL FIXATIVE

Corrosion Fixative Effectiveness – Fair. This process option's effectiveness is fair, provided the fixative can withstand the burial process, and has a design life that is a significant fraction of the cap design life. As with the previously discussed concrete-fill process option, the ability of the unfilled process equipment to withstand the structural pressures of the disposal facility is a necessary element of its effectiveness. There is no reduction in volume of the process equipment with this option. External fixatives have not been used by DOE as a method of corrosion inhibition in disposal facilities.

Corrosion Fixative Implementability – Very Good. Fixatives would be easy to implement if effective spray technologies can be developed. Such technologies must provide sufficient coverage and thickness to ensure the corrosion inhibitor would not degrade within the design life of the disposal facility. If viable as a spray, the optimum method for implementing this process option would be spraying in place prior to removal, spraying at a local spraying station in the process buildings before movement to a disposal facility, or spraying at the disposal facility prior to placement. If the inhibitor requires more aggressive application (surface preparation, dipping, two-part application), then these methods would require development, and the equipment may have to be moved to a processing area similar to the one for the segmentation process options.

Corrosion Fixative Costs. The costs are somewhat uncertain and are dependent on design requirements such as containment and method of application. It is assumed for this study that surface preparation is not required and that spray gun application is possible. Curing times are assumed to be several hours, allowing application in an assembly line method. This approach would be best performed in place inside the cell enclosures just before cutting and capping for removal, or immediately afterwards. The costs are as follows:

1. Removal	$38.0 million
2. Fixative application capital and operating costs	$19.9 million
3. Disposal facility capital and operating cost (including trucking) for 219,000 cy	$200.0 million
Total Capital Costs	**$257.8 million**

Table G.4 provides an evaluation summary for the previously discussed subsidence avoidance process options.

Table G.4. Summary of the Subsidence Avoidance Process Option Evaluation for PORTS

Void Reduction Process Option	Effectiveness	Implementability	Capital Cost
Segmentation to small size	Pro – Waste would be similar to construction debris; eliminates large majority of void Con – Tubing would be intact for short lengths; would be many curved surfaces that do not nest well in packages or landfill Good effectiveness	Pro – Currently in use; facilitates material removal if necessary; allows segregation of classified materials; achieves ability to cover disposal lifts; reduces process equipment volume in disposal facility from 219,000 cy to 60-70,000 cy Con – Extensive labor; hot cutting is a safety risk; double handling; processing classified equipment is a security risk; requires some new fixtures Good Implementability	Pro – Existing space and equipment; support and documentation largely in place; people are trained Con – Removal and segmentation are both labor-intensive $227 million
Shearing In Place	Pro – Would be demolition waste; eliminates large majority of void Con – Not applicable to converters Good effectiveness	Pro – Same equipment as used to shear structural steel in field; waste shipped with other building waste; significantly reduces pre-demolition equipment removal and segmentation. Improved safety. Reduces process equipment volume to 60-70,000 cy Con – Contamination would spread if not fixed/foamed Excellent Implementability	Pro – Avoids removal, movement, and segmentation (but not cutting) of all equipment and piping except converters Con – Increases demolition equipment and labor costs; adds capital and labor cost of fixation equipment; still requires segmentation of converters $204 million

Table G.4. Summary of the Subsidence Avoidance Process Option Evaluation for PORTS (Continued)

Void Reduction Process Option	Effectiveness	Implementability	Capital Cost
Compaction	Pro – Eliminates large majority of void; would crush tubing Con – Requires partial segmentation to enter compactor throat; curved heavy metal plate may not compact totally, leaving void Very good effectiveness	Pro – Same as segmentation; less hot cutting required Con – Same as segmentation but less cutting required; converter bundles must be handled separately; compaction is new operation, has new safety concerns, and is single point constraint if not operating; facility construction; 12 to 18 months to operation start Fair Implementability	Pro – Reduces segmentation to disassembly and segmentation to fit compactor; reduces disposal facility size and placement cost slightly from segmentation process option Con – Not viable for converters; double handling; construction and operating cost of compactor $220 million
Shredding	Pro – Eliminates large majority of void; good uniform waste matrix; mixes easily with fill Con – Requires partial segmentation to enter shredder throat; expands volume of plate steel walls Very good effectiveness	Pro – Same as compaction Con – Same as compaction Fair implementability	Pro – Reduces disposal facility size and placement cost slightly from segmentation process option Con – Increases amount of segmentation slightly; double handling; construction and operating cost of shredder $227 million
Melting	Pro – Eliminates all void Con – Requires partial segmentation to enter melter Excellent effectiveness	Pro – Same as compaction; eliminates classification constraints with processed waste Con – Same as compaction but greater safety issues; 2 to 4 years to operation start Fair implementability	Pro – Reduces disposal facility size and placement cost considerably from segmentation process option Con – Increases segmentation cost slightly to fit melter; double handling; construction and operating cost of melter $513 million

Table G.4. Summary of the Subsidence Avoidance Process Option Evaluation for PORTS (Continued)

Void Reduction Process Option	Effectiveness	Implementability	Capital Cost
Foaming	Pro – Fills large majority of void Con – Does not appreciably enter tubes; fills void, does not eliminate it Good effectiveness	Pro – Allows pipe shearing during demolition; provides effective contamination control; avoids classified segmentation; avoids all movement and effort of other processes Con – Must foam after cutting; additional equipment movement during demolition; requires equipment placement and filling around in disposal facility; would not apply to surge drums (continue to segment) Good implementability	Pro – Avoids all equipment removal (but not cutting) and segmentation except surge tanks; avoids equipment movement to processing Con – Requires additional foam holes in equipment; adds capital, material, and operating cost of foaming $397 million
Sand	Pro – Fills majority of voids Con – Does not appreciably enter tubes; requires filling at or near disposal facility; fills void, does not eliminate it Good effectiveness	Pro – Potentially single move to disposal; equipment preparation minimal; not labor-intensive; avoids classified segmentation; sand operations can be constructed during disposal facility construction Con – Requires placement and filling around in disposal facility; material must be kept dry; material takes up disposal cell space; not as effective as grout in reducing voids; would not apply to surge drums (continue to segment) Good implementability	Pro – Avoid segmentation costs for most of the equipment; avoid movement to segmentation Con –adds capital, material, and operating cost of sand filling $283 million
Grouting	Pro – Fills majority of void; provides long term structural stability Con – Same as sand Good effectiveness	Pro – Same as sand Con – Requires placement and filling around in disposal facility; material takes up disposal cell space; cold weather grouting requires additional curing measures; would not apply to surge drums (continue to segment) Very good implementability	Pro – Same as sand Con – adds capital, material, and operating cost of grouting $287 million

Table G.4. Summary of the Subsidence Avoidance Process Option Evaluation for PORTS (Continued)

Void Reduction Process Option	Effectiveness	Implementability	Capital Cost
Surround with Concrete Fill	Pro – Protects against subsidence Con – Corrosion inhibition for design life not technically proven; does not eliminate void Fair effectiveness	Pro – Eliminates need for additional move and segmentation; provides use for concrete fill waste; avoids classified segmentation Con – Introduces logistics of managing concrete; requires placement and fill in disposal facility; likely not logical for surge drums Fair implementability	Pro – Avoids all equipment removal (but not cutting) and segmentation except surge tanks; avoids equipment movement to processing Con – Requires special processing of concrete beyond that for normal demolition $280 million
Corrosion-inhibiting external fixative	Pro – Protects against subsidence Con – Corrosion inhibition for design life not technically proven; does not eliminate void Fair effectiveness	Pro – Eliminates need for additional move and segmentation; avoids classified segmentation Con – Introduces external fixation process before removal; requires placement and fill in disposal facility; likely not logical for surge drums Very good implementability	Pro – Avoids all equipment removal (but not cutting) and segmentation except surge tanks; avoids equipment movement to processing Con – Adds capital and operating cost for external fixation $258 million

G.5. SUMMARY

Numerous potential process options and approaches can be used to minimize future subsidence in a potential OSDC. An evaluation of the effectiveness, implementability, and cost of the process options that could be applied to the waste shows that some of the options are not viable for further consideration at PORTS. Those process options with a high reliance on newly designed and constructed facilities such as a compactor, shredder, or melter are no longer considered viable because of the increased schedule delays that would occur as a result of designing these facilities, constructing them, and training a work force to operate them. More importantly, these facilities could add additional costs with only a minimal improvement in effectiveness over segmentation or shearing to reduce voids and prevent subsidence. A compactor was shown to be effective in Oak Ridge, and the extra costs for the compactor could be offset by a reduction in the volume disposed on Site, but the schedule delays for design and construction are still considerations. These process options were summarized and screened out in Section 7 of the waste disposition Remedial Investigation/FS Report.

The other process options not considered to be viable are the corrosion inhibition process options. This is attributed to significant uncertainty about their long-term effectiveness. The tests necessary to demonstrate their ability to prevent equipment degradation for the required 1,000 years have not been performed. Tests to duplicate the uncertain environment of a disposal cell would be very difficult to design. Although these process options are much less expensive and easier to implement than all of the others, they are no longer considered for application at PORTS.

The two cutting options (segmentation using workers and shearing using heavy equipment) and the three filling process options remain viable for further consideration in the process building FS for PORTS. It is expected that all process equipment containing deposits or excessive deposition that would represent a criticality concern or exceed the disposal facility WAC would be removed, disassembled to remove uranium materials to abate the concern, and then segmented using workers to small pieces for disposal using the segmentation-to-small-size process option. Based on the existing NDA data, this process will be used on only a small percentage (less than 10 percent) of the process equipment.

Two representative process options for the majority of the remaining process equipment are selected for the equipment not requiring segmentation for deposit removal; grout filling and shearing. These process options will be used in the process building FS to develop alternatives. The other filling process options could be reconsidered during design as well as other techniques to control subsidence.

Grout filling is selected as the representative process option for subsidence avoidance of the major process equipment in the FS. In this scenario, the majority of the process equipment (compressors, converters, coolers) would be removed before demolition. The majority of the equipment would be transported to a staging area or a potential OSDC where they would be filled with grout. This process option avoids the large amount of effort, safety issues, and cost involved with disassembly and segmentation of the converters, compressors, and coolers to small size.

Shearing will be the representative process option in the FS for subsidence avoidance of the piping and valves. The piping and valves in the cell and unit bypasses would be sheared into waste during demolition of the process buildings. This option significantly reduces the amount of manual pipe cutting necessary for D&D and is much more cost-effective than filling.

The combined use of segmentation, shearing, and grout filling results in a safe and cost-effective method of preparing the process equipment and piping for disposal, one that recognizes the various equipment designs. It is effective in avoiding subsidence by filling or destructing the voids in the process gas equipment. Implementing these process options is reasonable because all of them have been used in demolition of like uranium enrichment buildings and equipment. This combination of representative process options will allow the FS to present a fair analysis of the impacts of avoiding subsidence at a potential OSDC by additional handling of the waste.

ATTACHMENT G.1: BASIS OF ESTIMATES

Estimates have been for comparison purposes only between possible process options. To the extent practical, existing estimates have been utilized, with adjustment to escalated dollars based on the schedule for process building decontamination and decommissioning (D&D). No contingency has been applied. If existing estimates are mostly applicable but require minor reductions or additions, those modifications are described in the basis to estimate the process option costs. Some estimates are based on existing experience and productivity factors from other D&D activities or based on communications from other D&D projects.

The scope for all estimates is assumed to be all of the X-330 and X-333 converters and compressors, but not the X-326 converters and compressors which are currently planned to be disposed off Site without processing (see Tables G.1 and G.2 in the main appendix text).

Segmentation to Small Size

Removal

1. Used the estimate for converter and compressor removal costs in escalated dollars from Appendix F of the process building Remedial Investigation/Feasibility Study (RI/FS) estimate for D&D work breakdown structures (WBSs) EM.PO.04.01.01.02.12 for X-333 and EM.PO.04.01.02.02.12 for X-330. Included cutting, capping, and movement to facility exit. Assume all piping or other process equipment removal in these estimates is minimal and within the accuracy of the estimate.

Movement

2. Used waste transport to on-Site disposal cell (OSDC) in RI/FS estimate for equivalent movement of components to X-700 and X-705 facilities for disassembly and segmentation. Escalated rate per cubic yard to the midpoint of X-330 and X-333 deactivation (assumed fiscal year [FY] 2019). Applied rate per in situ cubic yard for 219,000 cy of converters and compressors.

Disassembly and segmentation systems capital and operating cost

3. Used the estimate for refurbishment and capital modifications to disassemble and segment X-330 and X-333 converters and compressors from the process building RI/FS, Appendix F, Sensitivity Analysis of D&D with Off-Site Disposal of Wastes under process building D&D WBS PORTS: EM.PO.04.01.02.02.05 X-330 – X-700 Refurbishment. Costs are in escalated dollars.

4. Used the estimate for operating costs to disassemble and segment all of the X-330 and X-333 converters and compressors from the process building RI/FS, Appendix F, Sensitivity Analysis of D&D with Off-Site Disposal of Wastes under process building D&D WBS PORTS: EM.PO.04.01.01.02.05 X-333 – Material Removal-Process Deposit Mat and Recover Nickel and EM.PO.04.01.02.02.05 X-330 – Material Remove-Process Deposit Mat and Recover Nickel. Costs are in escalated dollars.

Trucking of segmented materials

5. This cost is included in the disposal facility capital and operating costs below.

Disposal facility capital and operating cost for 66,000 cy

6. Used the waste disposition RI/FS cost estimate for planning, design, capital construction, operating, and closure costs (but not long-term surveillance and maintenance) divided by the total waste volume to be disposed (1,300,000 cy) to determine a total disposal cost per cubic yard of waste. Escalated this rate per cubic yard to the midpoint of X-330 and X-333 deactivation (assumed FY 2019). Applied the rate per processed cubic yard for 66,000 cy of segmented converters and compressors.

Shearing in Place

Removal (X-330 and X-333 converters and cutting and capping compressors)

1. Used the removal estimate for Segmentation to Small Size. Note the adjustment in item 2 below.

Fixation with CCFix® (compressors only, not converters)

2. Assumed the cutting included with Removal above makes the compressors accessible for introduction of fixative. Application of the fixative inside the compressors will increase the removal labor costs by 15 percent but will avoid the lifting and crane transport of the compressors to the crane hatches for transport (assumed to be 8 percent of the removal cost). Therefore, the net labor increase for compressor fixative is 7 percent of the removal labor cost.

3. Added fixation equipment (electric-powered spray machines with hose delivery), total of three with two spares. Added material costs of $1/sq ft coated. Assumed compressors are 65,000 cy, and the conversion factor is 0.5 sq ft/cf. This equals 878,000 sq ft and is conservative because of the amount of equipment surface inaccessible for coating.

Movement (X-330 and X-333 converters)

4. Used Waste Transport to OSDC in RI/FS estimate for equivalent movement of converters to the X-700 facility for disassembly and segmentation. Escalated rate per cubic yard to the midpoint of X-330 and X-333 deactivation (assumed FY 2019). Applied rate per in situ cubic yard for 154,000 cy of converters.

Disassembly and segmentation systems (X-330 and X-333 converters) capital and operating cost

5. Used the estimate for refurbishment and capital modifications to disassemble and segment X-330 and X-333 converters from the process building RI/FS, Appendix E, Cost Estimate under process building D&D WBS PORTS: EM.PO.04.01.02.02.05 X-330 – X-700 Refurbishment. Costs are in escalated dollars.

6. Used the estimate for operating costs to disassemble and segment all of the X-330 and X-333 converters from the process building RI/FS, Appendix E, Cost Estimate under process building D&D WBS PORTS: EM.PO.04.01.01.02.05 X-333 - Material Removal-Process Deposit Mat and Recover Nickel and EM.PO.04.01.02.02.05 X-330 - Material Remove-Process Deposit Mat and Recover Nickel. Costs are in escalated dollars.

Shearing of compressors in place

7. Used the cost estimates for X-330 and X-333 Building Demolitions in the process building RI/FS, Appendix E, Cost Estimate, WBSs EM.PO.04.01.01.03.03 and EM.PO.04.01.02.03.03. Assumed that compressor density and complexity would increase the demolition effort by 50 percent for the cubic yards of compressors over the average cubic yard of building waste. The total cubic yards in situ of X-330 and X-333 building waste (excluding slabs and underground structures and piping) is 426,000 cy. Used the demolition estimates divided by the waste volume to determine the rate per cubic yard. Increased this rate by 50 percent and applied it to 65,000 cy of compressors. Costs are in escalated dollars.

Trucking of sheared materials (and segmented X-330 and X-333 converters)

8. This cost is included in the disposal facility capital and operating costs below.

Disposal facility capital and operating savings for 66,000 cy

9. Used the waste disposition RI/FS cost estimate for planning, design, capital construction, operating, and closure costs (but not long-term surveillance and maintenance) divided by the total waste volume to be disposed (1,300,000 cy) to determine a total disposal cost per cubic yard of waste. Escalated this rate per cubic yard to the midpoint of process building D&D (assumed FY 2019). Applied the rate per processed cubic yard for 66,000 cy of segmented converters and sheared compressors.

Compaction

Removal

1. Same estimate as segmentation.

Movement

2. Same estimate as segmentation.

Disassembly and segmentation systems (X-330 and X-333 converters and compressors) capital and operating cost

3. Used segmentation estimate, but reduced the operating cost by 5 percent for less segmentation required to fit compactor throat.

Compaction capital and operating cost (including movement)

4. Assumed two compactors similar to those estimated in the Critical Decision-1 estimate. Added 30 percent for supporting equipment and materials. Escalated to the midpoint of capital construction (assumed FY 2015).

5. For additional compactor operations, added one foreman, six D&D laborers, four D&D workers, and four rad techs for duration of operation (assumed 6 years). Added 20 percent for support equipment and materials beyond compactors. Escalated to the midpoint of process building D&D (assumed FY 2019).

Trucking of compacted materials (and segmented converter bundles)

6. This cost is included in the disposal facility capital and operating costs below.

Disposal facility capital and operating savings for 45,000 cy

7. Used same approach as segmentation except for 45,000 cy.

Shredding

Removal

1. Same estimate as segmentation.

Movement

2. Same estimate as segmentation.

Disassembly and segmentation systems (X-330 and X-333 converters and compressors) capital and operating cost

3. Used segmentation estimate, but increased segmentation operations cost by 5 percent for additional segmentation necessary to meet shredder throat size.

Shredding capital and operating cost (including movement)

4. Used the shredding automated sorting process white paper as a cost basis with the changes below. Assumed classified shredding would add a single shredder and conveyor equal to the secondary shredder.

5. Deducted the cleaning station, eddy current separator, ferrous sorting belts, nonferrous sorting belts, and radiation detection and monitoring allowance.

6. Removed contingency and escalated to the midpoint of capital construction (assumed FY 2015).

7. For shredding operations, added one foreman, six D&D laborers, four D&D workers, and four rad techs for duration of operation (assumed 6 years). Added 20 percent for support equipment and materials beyond shredding equipment. Escalated to the midpoint of process building D&D (assumed FY 2019).

Trucking of compacted materials

8. This cost is included in the disposal facility capital and operating cost below.

Disposal facility capital and operating savings for 35,000 cy

9. Used same approach as segmentation except for 35,000 cy.

Melting

Removal

1. Same estimate as segmentation.

Movement

2. Same estimate as segmentation.

Disassembly and segmentation systems (X-330 and X-333 converters and compressors) capital and operating cost

3. Used segmentation estimate with changes below.

4. Increased the segmentation operations cost for converters and compressors by 10 percent for more cuts required.

Melting capital and operating cost (including movement)

5. Used *Cost Estimate to Meet CERCLA Needs Related to Constructing a Melter Thermal Waste Treatment Alternative* (Restoration Services, Inc. [RSI] 2011) for capital costs. Added an additional 5-ton melter for barrier. For operating costs, used shredder operating costs plus 10 percent. Escalated to the midpoint of capital construction (assumed FY 2015).

6. Used the following assumptions for melting operations costs. Assumed a standalone facility with full operations support. Labor costs included one project manager, three engineers, three health and safety specialists, one radiological engineer, five rad techs, one quality specialist, two quality techs, two waste management specialists, two foremen, five waste management workers, four laborers, three equipment operators, two mechanics, two electricians, and one truck driver. Assumed materials and equipment costs at 30 percent of labor costs. Assumed facility power costs are 4 megawatts on

average. Assumed subcontract costs are $500,000 annually. Escalated to the midpoint of process building deactivation (assumed FY 2019).

Trucking of melted materials

7. This cost is included in the disposal facility capital and operating cost below.

Disposal facility capital and operating savings for 15,000 cy

8. Used same approach as segmentation except for 15,000 cy.

Foaming

Cutting and preparation

1. Used segmentation process option removal costs. Added three additional D&D workers each to three crews for the period of D&D deactivation. Assumed the personnel associated with rigging and moving the equipment and piping, plus the three additional workers per crew, will now be dedicated to the foaming process after cutting and installing caps on the equipment and piping.

Installation of plates, foam injection ports, and vent ports

2. Additional cutting for foam holes adds one additional D&D worker and one additional high-lift platform to each of the three removal crews for the period of D&D deactivation.

3. Plates must be sheet metal and be taped or epoxy-attached, not covered with plastic. Added one D&D worker for each of the three removal crews. Increased material costs for 3,548 converters and compressors by $700 each.

Foam capital and operating cost

4. Capital cost for foaming assumed as one foaming unit for the three removal crews plus two spares at $75,000 per unit (total of five), heated foam storage units (three each) at $30,000, four each 5,000-lb forklifts, and two additional high-efficiency particulate air units per crew (total of six).

5. Material cost for foam assumed as $500 (FY 2013 dollars) per cy foamed. Conservatively, assumed all 219,000 cy are foamed.

6. Operating costs for foaming are included in the cutting estimate above. Foaming support costs for all the removal crews assumed as two D&D workers and one equipment operator for movement and control of foam materials for each crew for the period of D&D deactivation.

Movement to disposal facility

7. This cost is included in the disposal facility capital and operating cost below.

Disposal facility capital and operating cost for 219,000 cy

8. Used same approach as segmentation except for 219,000 cy. Added disposal facility capital and operating costs for a 100-ton crane for the period of D&D deactivation.

Sand Filling

Removal

1. Used the same estimate as segmentation. Adjusted for different plate strengths and ports in next item.

Installation of plates, pouring, and vent ports

2. Added 30 percent additional labor (including the cleared workers for converters) to removal and movement to install heavier plates, and to cut and temporarily seal pour and vent ports.

3. Added material costs of $1,200/component for 3,548 converters and compressors for heavier bracing on large plates and fabrication costs for port seals.

Movement to disposal facility

4. This cost is included in the disposal facility capital and operating cost below.

Sand capital and operating cost

5. Assumed design and construction of a covered materials storage area for 1,000 cy of sand. Assumed use of front end loaders for loading sand into dump trucks.

6. Assumed dry materials for 219,000 cy of sand, two front end loaders, and two 5,000-lb forklifts.

7. Major equipment to handle the process gas equipment and piping assumed to be two trucks, two 25-ton forklifts, and one 100-ton mobile crane. Escalated to the midpoint of capital construction (assumed FY 2015).

8. Operations personnel assumed to be one supervisor, one foreman, four waste management workers, three equipment operators, two craftsmen, and two rad techs for a period of 6 years (length of X-330 and X-333 deactivation). Escalated to the midpoint of process building deactivation (assumed FY 2019).

Disposal facility capital and operating cost for 219,000 cy

9. Used same approach as segmentation except for 219,000 cy. Added disposal facility capital and operating costs for a 100-ton crane and two sand auger conveyors for the period of D&D deactivation.

Grouting

Removal

1. Used the same estimate as segmentation. Adjusted for different plate strengths and ports in next item. Installation of plates, injection ports, and vent ports.

2. Added 30 percent additional labor (including the cleared workers for converters) to removal and movement to install heavier plates, injection ports, and vent ports.

3. Added material costs of $1,200 each for 3,548 converters and compressors for heavier bracing on large plates and fabrication costs for injection and vent ports.

Movement to disposal facility

4. This cost is included in the disposal facility capital and operating costs below.

Grouting capital and operating cost

5. Used the process building RI/FS D0 cost estimate for grouting at the OSDC. Removed the estimates for movement and trucking (included elsewhere in this estimate).

Disposal facility capital and operating cost for 219,000 cy

6. Used same approach as segmentation except for 219,000 cy. Added disposal facility capital and operating costs for a 100-ton crane for the period of D&D deactivation.

Surround with Concrete Fill

Removal

1. Used the same estimate as segmentation. Adjusted for heavy plate installation in the next item.

2. Added 20 percent additional labor (including the cleared workers for converters) to Removal to install heavier plates.

3. Added material costs of $900 each for 3,548 converters and compressors costs for heavier bracing on large plates.

Concrete rubblization and staging

4. For an in situ equipment and piping volume of 219,000 cy, the as-placed volume was assumed to be nominally 360,000 cy; therefore, assumed that 141,000 cy of rubblized concrete fill is required. Used 160,000 cy for edge effects. Because concrete is already part of the D&D waste, the process option estimate used assumption to segregate, process, and manage it for use as fill around the equipment.

5. Segregation assumed to be with one track-mounted machine outfitted with a grappler and one front end loader to remove concrete slabs and chunks. Processing assumed to be with two track-mounted machines outfitted with concrete pulverizers (this is because of the rate of generation; if faster is required, then add a concrete crusher) and two front end loaders. Trucks and drivers for movement of concrete fill are already included in the D&D estimate.

6. Labor and materials cost included one supervisor, one foreman, seven equipment operators, two D&D workers, three craftsmen (maintenance), and two rad techs for the period of D&D deactivation. Material costs included pulverizer teeth changeout each 500 cy and maintenance contracts on equipment.

Movement to disposal facility

7. This cost is included in the disposal facility capital and operating costs below.

Disposal facility capital and operating cost for 219,000 cy

8. Used same approach as segmentation except for 219,000 cy. Added disposal facility capital and operating costs for a 100-ton crane.

Corrosion-Inhibiting Fixative

Removal

1. Same estimate as segmentation.

Fixative application capital and operating costs

2. Added two additional D&D workers, two laborers, and one equipment operator to each of the three removal crews for converters and compressors. These personnel assumed to be dedicated to the fixation process after cutting and installing caps on the equipment.

3. Added coating equipment (electric-powered spray machines with hose delivery), one per cutting/coating crew with two spares for a total of five. Added material costs of $4/sq ft coated. Assumed process equipment is 219,000 cy and the conversion factor is 0.5 sq ft/cf because of the larger diameters. This equals 3.0 million sq ft.

Movement to disposal facility
4. This cost is included in the disposal facility capital and operating cost below.

Disposal facility capital and operating cost for 219,000 cy
5. Used same approach as segmentation except for 219,000 cy. Added disposal facility capital and operating costs for a 100-ton crane.

H.1 INTRODUCTION

The permanent disposition of the Portsmouth Gaseous Diffusion Plant (PORTS) decontamination and decommissioning (D&D) waste in a potential new on-Site disposal cell (OSDC) requires a substantial quantity of structural fill soil ("fill") to achieve OSDC design and compaction requirements for waste placement. "Fill" in this appendix refers to engineering category (EC)-1 as defined in Section 1.1 of the main text of the Site-wide Waste Disposition Evaluation Remedial Investigation/Feasibility Study (waste disposition RI/FS). The potential construction of a new OSDC to compliantly dispose of the D&D waste that would result from the takedown of the PORTS buildings and structures is part of Alternative 2, the combined on-Site and off-Site disposal alternative, under evaluation in the waste disposition RI/FS. The waste disposition RI/FS is being conducted to satisfy requirements in *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) (Ohio Environmental Protection Agency [Ohio EPA] 2012).

This appendix presents the results of a fill source evaluation study to identify and evaluate the options for obtaining fill in sufficient quantities to meet potential on-Site D&D waste placement needs, if Alternative 2 is selected for implementation in the waste disposition Record of Decision (ROD).

Alternative 2 is described in detail in Section 8.3.2 Description of Alternative 2 in the main body of the RI/FS report. The primary feature of Alternative 2 is the design and construction of a new OSDC in an area of the plant where the most favorable underlying geology is present to support an on-Site waste disposal approach. The intent of the fill source evaluation presented in this appendix is to identify a range of viable options (termed "process options") that can satisfy a potential OSDC's projected fill needs, and to then identify a representative process option for inclusion in the formulation of Alternative 2 to support the detailed alternative evaluation presented in Section 9 of the RI/FS report.

The concept of using representative process options to formulate and evaluate RI/FS alternatives is a fundamental tool recognized in the U.S. Environmental Protection Agency's (EPA's) *Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA* (EPA 1988). During the development of alternatives, "…technology processes (called process options) considered to be implementable are evaluated in greater detail before selecting one process to represent each technology type to simplify the subsequent development and evaluation of alternatives without limiting flexibility during remedial design. The representative process provides a basis for developing performance specifications during preliminary design; however, the specific process actually used to implement the remedial action at a site may not be selected until the remedial design phase." The fill source evaluation presented in this appendix adopts the representative process option concept, as recognized by the EPA RI/FS guidance, to arrive at the identified option for inclusion in Alternative 2. All viable process options, however, including the representative option, would remain available for consideration during remedial action selection, design, and implementation as necessary, consistent with the representative process option concept adopted by the RI/FS guidance.

H.1.1 PROJECTION OF OSDC FILL VOLUME REQUIREMENTS IN THE DEVELOPMENT OF ALTERNATIVE 2

Under Alternative 2, it is estimated that 1.078 million cy of D&D waste requiring fill (EC-2) would require placement in a potential OSDC. FS-level design calculations for a potential OSDC indicate that a 2:1 EC-1/EC-2 ratio would be required to achieve design and compaction requirements in the placement of the waste (2 cy of soil [EC-1] required for each cy of waste requiring fill [EC-2] placed in a potential OSDC). Using this target 2:1 ratio, there is a need for 2.156 million cy of fill to satisfy projected waste placement demands. The final EC-1/EC-2 ratio would be established during detailed remedial design, if Alternative 2 is selected as the preferred remedial action for the ROD. For FS-level planning purposes, however, the 2:1 ratio is considered representative and is used to support all calculations in the waste disposition RI/FS and this companion fill source evaluation appendix.

In the DFF&O (Para. 5(e)(3) and 5(e)(4)(ii)), residual soil is identified as soil which adheres to the equipment, structures, piping, building contents, concrete foundations, etc., while integral soil refers to soil that otherwise must be excavated as part of dismantlement, demolition, and removal activities, or as an integral part of a removal or remedial action pursuant to the DFF&O. It is estimated that 53,000 cy of "residual soil" (EC-1) would be generated concurrently with and as a consequence of demolition activities. The residual soil is primarily from adherence to slabs and subsurface structures, utility corridor excavations, and the need for laybacks to support removal of building foundations. The residual soil (EC-1) volume offsets a portion of the projected fill requirement, resulting in a net need for 2.103 million cy of fill. This 2.103 million cy net projection is used throughout this appendix to develop and evaluate process options for meeting the projected needs.

H.1.2 IDENTIFICATION OF PROCESS OPTIONS TO MEET PROJECTED FILL VOLUME REQUIREMENTS

The fill source evaluation considered the following range of viable process options to meet the 2.103 million cy projected OSDC fill volume requirements under Alternative 2:

- **Source Option 1:** Purchase clean fill from commercial off-PORTS sources (referred to as the "Buy" option).

- **Source Option 2:** Use on-PORTS clean soil obtained from one or more new on-PORTS soil borrow areas that would be developed within the boundaries of the PORTS reservation, including the possibility of borrow sources within the potential OSDC construction footprint itself (referred to as the "Make/Clean" option).

- **Source Option 3:** Use on-PORTS sources of non-D&D contaminated soil obtained from various areas of the plant (referred to as the "Make/Contaminated" option).

Each of these three source options is described in detail in Section H.2 and then evaluated in Section H.3. In Section H.4, the representative process option is identified, based on the overall evaluation. For orientation purposes, Figure H.1 shows the locations of the soil contamination areas (EC-1) at PORTS that are candidates for inclusion in developing Source Option 3, regardless of the regulatory authority required to excavate and dispose of the soil. Within the identified area there are several closed landfills or land disposal units, including X-231A, X-231B, X-749, X-749A, and X-749B. The identified areas also include many solid waste management units, some of which have not been fully characterized and were deferred under the Ohio Consent Decree.

H.1.3 APPROACH TO EVALUATING AND COMPARING FILL SOURCE OPTIONS

The source-option evaluation is conducted by first assessing the ability of each potential option to meet the engineering needs, quantity demands, and timing of the fill requirement. All three of the potential source options are considered able to meet the engineering needs, quantity demands, and timing, and are therefore identified as viable options for inclusion in the detailed evaluation.

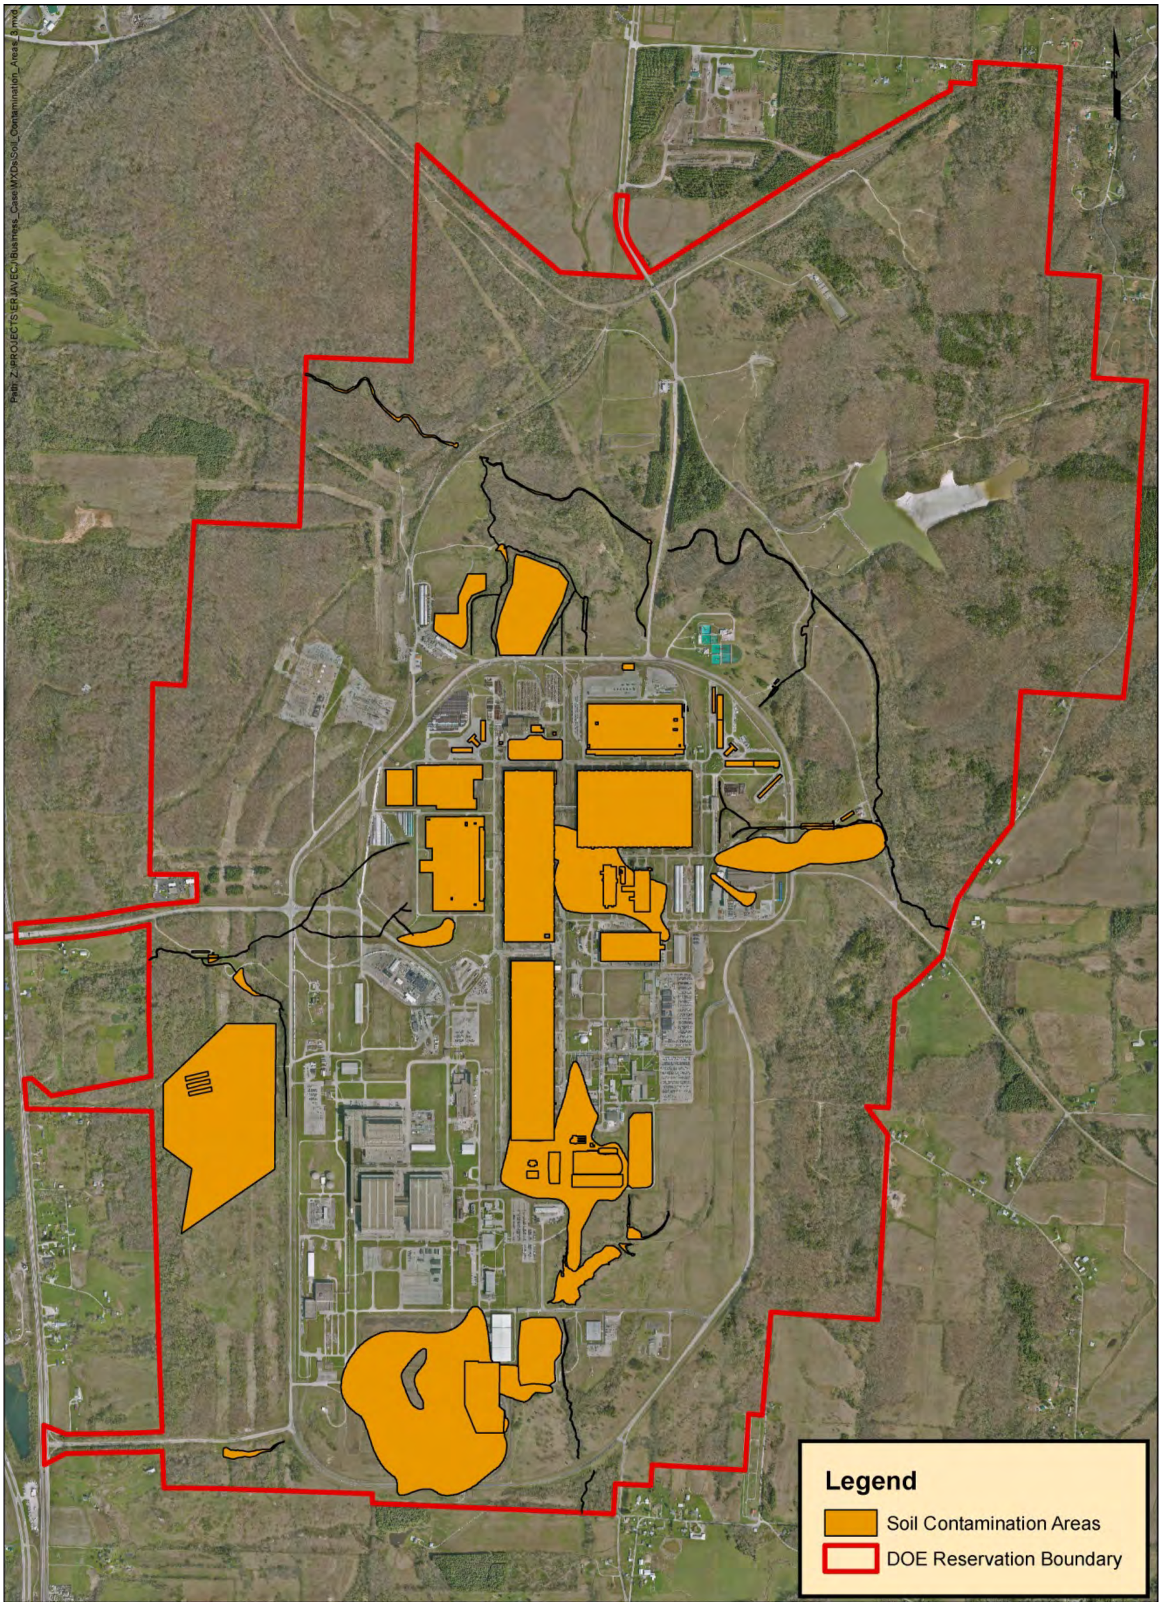

Figure H.1. Candidate Soil Contamination Areas for Consideration as Sources of Fill

The evaluation considers the cost of the three viable source options to support the identification of the representative option. This is presented in detail in Section H.3. The representative process option that is identified in Section H.4 of this appendix is then carried forward to support the formulation of waste-disposal Alternative 2.

Excavation of non-D&D contaminated soil for use as fill could impact areas that have undergone final or interim action under the Ohio Consent Decree. Those areas include landfills that have caps that would be removed if the underlying soil were used as a source of fill and areas with active groundwater interim remedies including monitoring wells and other components that could be impacted by fill excavation activities. The U.S. Department of Energy (DOE) would be required to seek and gain approval from Ohio EPA before undertaking any fill excavation activities that would impact such areas. Completing this process with Ohio EPA would increase the administrative requirements for implementing Alternative 2. Following completion of any fill excavation activities, any follow-on evaluation or remedial activities for affected areas would be conducted in accordance with the Ohio Consent Decree.

H.1.4 APPENDIX H ORGANIZATION

The remainder of Appendix H is organized into the following major sections and contents:

Section H.2	**Options to Obtain Fill for a Potential OSDC:** Describes each of the three source options individually and identifies the major potential sources of contaminated soil for inclusion in the development of Source Option 3.
Section H.3	**Cost Comparison of the Three Options to Obtain Fill:** Evaluates and compares the cost of the three options.
Section H.4	**Identification of the Representative Process Option:** Reviews the results of the evaluation and identifies the representative fill source option for inclusion in waste disposal Alternative 2 in the main body of the RI/FS report.

H.2 OPTIONS TO OBTAIN FILL FOR A POTENTIAL OSDC

As discussed in Section H.1.2, several viable options for obtaining fill are available, consisting of: (1) buying clean fill from off-PORTS sources; (2) excavating clean fill from on-PORTS source areas (e.g., site preparation activities in the potential OSDC footprint); and (3) excavating contaminated soil from various locations across the PORTS reservation. The following subsections describe these three primary options in detail.

H.2.1 SOURCE OPTION 1: BUYING CLEAN FILL FROM OFF-PORTS SOURCES

In this option, fill would be purchased from an off-PORTS vendor and managed by plant personnel for delivery into a potential OSDC, concurrent with waste placement activities within a potential OSDC.

As discussed in Section H.1.1, the volume of fill required is 2.103 million cy. Trucks would transport soil from a vendor facility to an approved clean stockpile area within a potential OSDC operations footprint and staged adjacent to a potential OSDC. When waste placement operations within a potential OSDC require fill, the requisite volume of soil would be transferred from the staging area into a potential OSDC. This operation is anticipated to be two-fold. Load-out operations would be conducted using “clean” heavy equipment to load the transport trucks. The transport trucks would be required to enter the waste areas within a potential OSDC and as such they would be considered “contaminated”, requiring segregation to prevent contaminating clean areas. This segregation of equipment would allow the fill staging area to remain clean, permitting the vendor to consistently operate unencumbered by radiological control operations associated with OSDC waste placement.

H.2.2 SOURCE OPTION 2: EXCAVATION OF CLEAN SOIL FROM ON-PORTS BORROW AREAS FOR USE AS FILL

This option considers the generation of clean soil from areas within the PORTS reservation for the creation of 2.103 million cy of fill. Specifically, the source area is the footprint of a potential OSDC where site preparation activities would generate soil and rock that can be amended with the soil to satisfy the fill requirements, along with other clean source areas at PORTS. The use of the materials generated from the construction of a potential OSDC was reviewed as a source due to the fact that the materials would be generated as part of OSDC construction activities and made readily available at that time.

During the construction of a potential OSDC, several million cubic yards of overburden soil and rock would be generated. The excess soil and rock would be stockpiled adjacent to the construction area, and this mixture of soil and rock would be processed into a product that would meet design specifications and could be used as fill. This processing would include such operations as screening and crushing, which add to the typical borrow area costs of simple excavation and transportation of clean material.

Processing would take place in a designated clean area near a potential OSDC. The rock from site preparation activities would be screened and crushed for size-reduction and then amended with the soil generated from those same site preparation activities, creating a usable and compactable material. When waste placement operations within a potential OSDC require fill, the requisite volume of soil would be transferred from the staging area into a potential OSDC.

This operation is anticipated to be two-fold. Screening and crushing operations would be conducted using “clean” heavy equipment to load the transport trucks. The transport trucks would be required to enter the waste areas within a potential OSDC, and as such they would be considered “contaminated”, requiring segregation to prevent contaminating clean areas. This segregation of equipment would allow the fill staging area to remain clean, permitting the plant personnel to consistently operate unencumbered by radiological operations.

H.2.3 SOURCE OPTION 3: EXCAVATION OF NON-D&D CONTAMINATED SOIL FROM ON-PORTS BORROW AREAS FOR USE AS FILL

Using non-D&D contaminated soil from various on-PORTS sources is a more complex option that requires a more detailed evaluation than the previous two options. The operational history at PORTS has resulted in the presence of surface and near-surface soil contamination areas, closed landfills, and contaminated groundwater areas. Together, these serve as the potential source(s) of contaminated fill for consideration in developing Source Option 3.

Surface and Near-Surface Soil Contamination Areas

There are various soil areas across the PORTS reservation that are expected to be contaminated as a result of historical plant operations, including, for example, the management of radiological and/or chemical materials or waste. The majority of these expected soil contamination areas are within Perimeter Road and are associated with the three main process buildings and the ancillary support facilities, while the remainder are just outside Perimeter Road and are associated with laydown or material staging areas. Although these soil areas have not yet been fully characterized, existing process knowledge and the available characterization conducted to date indicate these areas are viable sources of contaminated soil that could help satisfy fill quantity requirements for a potential OSDC.

Most of the contamination is expected to be limited to within the top few feet due to surficial contaminant deposition, with some contamination expected to be greater than 10 ft deep following preferential pathways near disturbed areas associated with subsurface structures. The estimated volume of non-D&D contaminated soil (EC-1) associated with these areas is 710,000 cy. The location and volume of the surface and near-surface soil contamination areas makes them ideal candidates for consideration under Source Option 3 to help satisfy the demands for fill.

Subsurface Soils Associated With On-PORTS Groundwater Contamination Areas

The contaminated subsurface soils that are in contact with contaminated groundwater at PORTS (EC-1) are the largest source of contaminated fill available for consideration in developing Source Option 3, and could complement the estimated 710,000 cy of potential fill projected to be available from the surface and near-surface soil contamination areas discussed above. While DOE does not expect to excavate Ohio Consent Decree plumes for groundwater remediation, those areas may be used to obtain additional fill. This subsection describes the five groundwater contamination areas at PORTS and identifies the subsurface contaminated soil quantities within the groundwater contamination areas that could serve as a source of fill for further consideration in developing Source Option 3 to achieve the 2.103-million-cy projected fill demand.

There are five general groundwater contamination areas at PORTS: X-701B, X-740, X-749/120, 7-Unit, and 5-Unit. Trichloroethene (TCE) is the primary contaminant in the groundwater. Based on the sizes and concentrations of TCE contamination observed in the groundwater, it is evident that in certain circumstances TCE has entered the subsurface as free-phase dense nonaqueous phase liquid (DNAPL) and created dissolved TCE groundwater plumes in the Gallia sand and gravel formation. In certain circumstances, DNAPL may have also accumulated in the weathered portion of the Sunbury shale formation below the Gallia sand and gravel formation, as illustrated in Figure H.2.

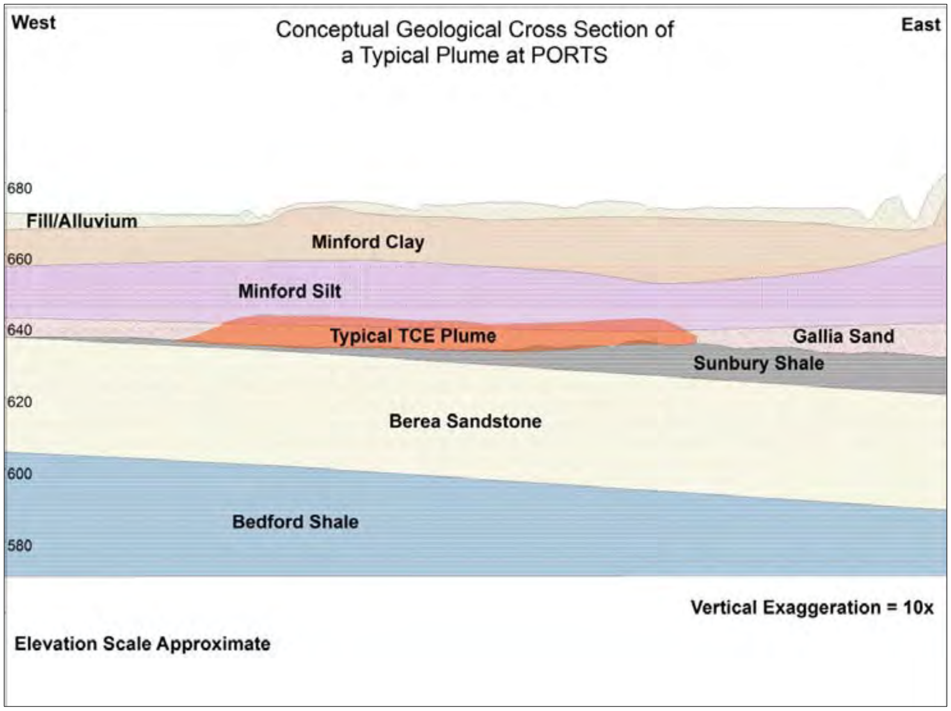

Figure H.2. Example of Cross Section of Typical Plume (not to scale)

The highest-concentration dissolved TCE groundwater contamination locations in the five groundwater contamination areas (and the areas where DNAPL contamination may be present) are the highest priority areas considered in this evaluation for obtaining contaminated fill from the groundwater contamination areas (EC-1).

An evaluation of the fill available from the subsurface soils in each of the five groundwater contamination areas is summarized below. The sources of this information are the PORTS Geographical Information System and interpretations of geological cross sections.

X-701B Groundwater Area

The X-701B soil contamination area that is impacted by the groundwater unit is generally defined as a roughly 7 ft thick Gallia Formation, plus 1 ft of overlying Minford silt sitting atop the Sunbury shale. This layer of contaminated soil, on average, is approximately 22 ft below ground surface and is beneath layers of alluvium, Minford clay, and the majority of the Minford silt. (Together these layers comprise the overburden material.)

Using the thickness of approximately 7 ft, the volume of contaminated soil within this area is 267,000 cy. Overlying that same area, the volume of overburden material is 719,000 cy.

In the X-701B area, the primary constituents of contamination concern are TCE and its degradation products. However, there also is a minor presence of polychlorinated biphenyls (PCBs), Resource Conservation and Recovery Act of 1976, as amended (RCRA) metals, and limited radionuclides (uranium and technetium-99).

X-740 Groundwater Area

The X-740 soil contamination area that is impacted by the groundwater unit is generally defined as a roughly 4-ft-thick Gallia Formation, plus 1 ft of overlying Minford silt sitting atop the Berea. This layer of contaminated soil, on average, is approximately 29 ft below ground surface and is beneath layers of alluvium, Minford clay, and the majority of the Minford silt (combined comprises the overburden material).

Using the thickness of approximately 4 ft, the volume of contaminated soil within this area is 15,000 cy. Overlying that same area, the volume of overburden material is 68,000 cy.

In the X-740 area, the primary constituents of contamination concern are TCE and its degradation products.

X-749/120 Groundwater Area

The X-749/120 soil contamination area that is impacted by the groundwater unit is generally defined as a roughly 6-ft-thick Gallia Formation, plus 1 ft of overlying Minford silt sitting atop the Sunbury shale. This layer of contaminated soil, on average, is approximately 19 ft below ground surface and is beneath layers of alluvium, Minford clay, and the majority of the Minford silt (combined comprises the overburden material).

Using the thickness of approximately 6 ft, the volume of contaminated soil within this area is 643,000 cy. Overlying that same area, the volume of overburden material is 1,367,000 cy.

In the X-749/120 area, the primary constituents of contamination concern are TCE and its degradation products. However, PCBs, RCRA metals, and limited radionuclides (uranium and technetium-99) also are present.

7-Unit Groundwater Area
The 7-Unit soil contamination area that is impacted by the groundwater unit is generally defined as a 9-ft-thick Gallia Formation, plus 2 ft of overlying Minford silt sitting atop the Sunbury shale. This layer of contaminated soil, on average, is approximately 30 ft below ground surface and is beneath layers of alluvium, Minford clay, and the majority of the Minford silt (combined comprises the overburden material).

Using the thickness of approximately 9 ft, the volume of contaminated soil within this area is 278,000 cy. Overlying that same area, the volume of overburden material is 789,000 cy.

In the 7-Unit area, the primary constituents of contamination concern are TCE and its degradation products. However, there also is a minor presence of technetium-99.

5-Unit Groundwater Area
The 5-Unit soil contamination area that is impacted by the groundwater unit is generally defined as a roughly 7-ft-thick Gallia Formation, plus 1 ft of overlying Minford silt sitting atop the Sunbury shale. This layer of contaminated soil, on average, is approximately 27 ft below ground surface and is beneath layers of alluvium, Minford clay, and the majority of the Minford silt (combined comprises the overburden material).

Using the thickness of approximately 7 ft, the volume of contaminated soil within this area is 292,000 cy. Overlying that same area, the volume of overburden material is 903,000 cy.

In the 5-Unit area, the primary constituents of contamination concern are TCE and its degradation products.

Several of the subsurface contamination areas described above include landfills that are positioned on top of the subsurface contaminated soil. These landfills contain contaminated soil (EC-1) along with waste requiring fill (EC-2). These landfills could also serve as a potential source of fill for a potential OSDC.

H.2.3.1 Assessment of Non-D&D Contaminated Soil as Fill Quantities for Developing Source Option 3

As discussed in Section H.1.1, the volume of fill required for a potential OSDC is 2.103 million cy in order to meet the waste placement requirements. The majority of contaminated soil on the PORTS reservation that would serve to satisfy this fill requirement would need to originate from the subsurface soil associated with the groundwater contamination areas (EC-1), supplemented with the estimated 710,000 cy of contaminated soil projected to be available from the surface and near-surface soil contamination areas (EC-1).

Landfills that would be potential sources of contaminated fill (EC-1 and EC-2) are located over or adjacent to two of the previously discussed soil contamination areas associated with the groundwater contamination. These landfills, X-231A, X-231B, X-749, X-749A, and X-749B, in general, have clean material (soil) serving as their associated caps, and the groundwater contamination areas have a relatively thick stratum of clean overburden overlying the subsurface contaminated soil. The approach for dealing with the clean cap and overburden soil is discussed in detail in the following section (Section H.2.3.2).

The landfills in question would have to be removed to provide access to the soil contamination areas associated with the groundwater contamination areas. These landfills contain, in total, approximately 223,000 cy of waste requiring fill (EC-2) and an estimated 345,000 cy of contaminated soil (EC-1) beneath their caps. At the expected 2:1 EC-1/ EC-2 ratio, use of the landfills would require an additional 446,000 cy of fill in order to be placed in a potential OSDC. Therefore, the fill requirement under Source Option 3 is increased by 101,000 cy (from 2.103 million cy to 2.204 million cy) after accounting for both the contaminated soil (EC-1) and also the waste requiring fill (EC-2) anticipated to be encountered during excavation of the landfills.

Table H.1 identifies the fill needs associated with Source Option 3 and outlines the proposed scenario for use of contaminated soil to meet those fill needs. Table H.1 is organized to present the waste volume requiring fill (EC-2) expected to be generated from the five targeted contaminated soil areas, in addition to the waste volumes requiring fill that would be generated from the D&D of the buildings (EC-2). The table then provides a breakdown of the additional soil (EC-1) required for placement of the additional waste requiring fill (EC-2) in the proposed OSDC. The volume of soil expected to be generated from the excavation of the landfills is then compared to the soil volume required for placement and the remaining soil needs are listed. The final column of the table goes on to show how contaminated soil would be used to balance all needs. The breakdown presented in this table summarizes the detailed planning that has been used in the development of Source Option 3. The table confirms that the use of contaminated soil under Source Option 3 can meet the projected fill requirements of a potential OSDC, even when the additional waste requiring fill from the landfills is considered.

H.2.3.2 Implementation Approach for Source Option 3

For Source Option 3, the intent is to cost-effectively satisfy the fill requirements for a potential OSDC using contaminated soil as the source of the fill. This intention considers that an area-by-area excavation process would be implemented — targeting the abundant source of contaminated subsurface soil associated with the groundwater contamination areas as the primary source of fill, and supplemented with the contaminated soil available from the surface and near-surface soil contamination areas. As described above in Section H.2.3.1, each of the subsurface fill sources associated with the groundwater areas lies beneath a “layer” of clean overburden soil. Therefore, the clean overburden materials would be removed and stockpiled in an adjacent and approved location for later use as backfill for the contaminated subsurface soil excavation area.

Several of the subsurface contamination areas include historical landfills that are positioned on top of the subsurface contaminated soil. These landfills, as encountered, would be excavated to the extent of their documented or delineated boundaries and depths with excavation continuing into the contaminated subsurface soil associated with groundwater contamination in order to obtain the required volumes from each area needed to satisfy the 2.204-million-cy projected fill demand.

Similar to the clean overburden associated with the subsurface contaminated soils, the landfills have caps constructed of clean soil, which would be stockpiled and utilized in the same manner as the aforementioned clean overburden. For purposes of cost analysis, the majority of the contaminated waste requiring fill (EC-2) encountered within the exposed landfills is assumed to meet the expected waste acceptance criteria (WAC) for a potential OSDC and waste meeting such WAC would be disposed at a potential OSDC. The landfills also contain contaminated soil (EC-1), which DOE anticipates using as fill to support waste placement in a potential OSDC.

Table H.1. Contaminated Source Areas for OSDC Fill under Source Option 3

Source Area	Waste Requiring Fill (EC-2) (cy)	Fill (EC-1) Required at 2:1 Ratio (cy)	Residual Soil (EC-1) (cy)	Contaminated Soil from Landfills (EC-1) (cy)	Net Fill (EC-1) Required (cy)	Contaminated Soil from Surface, Near Surface, and Subsurface Areas to be Used as Fill (EC-1) (cy)
Building Waste	1,078,000	2,156,000	53,000	--	2,103,000	--
Subtotal	***1,078,000***	***2,156,000***	***53,000***		***2,103,000***	--
Surface and Near-Surface Soil Contamination Areas	--	--	--	--		710,000

Grand Total	**1,301,000**	**2,602,000**	**53,000**	**345,000**	**2,204,000**	**2,204,000**

EC = engineering category

Any waste that did not meet the approved OSDC WAC would be sent off Site for treatment and/or disposal, as required.

Following completion of excavation of selected landfills and/or groundwater plumes, the set aside clean overburden from the same area would be used to backfill the excavated area. The filled footprint would be graded to drain. Following this excavation, backfill with the clean overburden soil, and re-grading process, there would not be deep holes and/or steep slopes left in the excavated areas. Range of the final soil surface contours within the Perimeter Road would be within approximately 10 ft and still relatively flat. The re-graded contours would also promote surface water drainage in a pattern similar to the pre-excavation conditions, so future surface water flow rates in the existing surface water drainage areas would not be significantly impacted. Based on preliminary cut and fill calculations, this final site condition can be achieved without importing clean fill.

H.3 COST COMPARISON OF THE THREE SOURCE OPTIONS FOR OBTAINING FILL

Each of the three source options (“Buy,” “Make/Clean,” and “Make/Contaminated”) to obtain fill (EC-1) for a potential OSDC has been estimated independently from each other, allowing their costs to be used in concert with the remaining costs associated with Alternative 2, to provide an assessment of each source option’s impact on Alternative 2.

H.3.1 SOURCE OPTION 1: “BUY” OPTION

The total estimated cost of Source Option 1 is $50 million, which is built up by the estimated purchase price of approximately $11/cy at 2.1 million cy, equaling $24 million for the materials with an additional $26 million for handling on-Site stockpile management, and placing with the contaminated D&D waste. In order to evaluate all options on equal ground, this constant dollar cost was converted into net present value (NPV), as recommended in EPA’s Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended, cost-estimating guidance (EPA 2000). With that, the NPV for the use of purchased clean soil as fill in a potential OSDC is $43 million.

H.3.2 SOURCE OPTION 2: “MAKE/CLEAN” OPTION

The total estimated cost of Source Option 2 is $61 million, which is built up by the estimated cost of the screening and crushing of the excavated rock at $52 million. The remaining $9 million is attributed to the transportation and use as fill. For the same reasons as stated above, this estimate was converted into NPV, resulting in a cost estimate of $53 million.

H.3.3 SOURCE OPTION 3: “MAKE/CONTAMINATED” OPTION

The total estimated cost of Source Option 3 is $299 million. This cost is built up by $136 million associated with excavation of the non-D&D contaminated soil as well as the staging and replacement of the clean overburden and caps. The remaining $163 million is attributed to the transportation and use as fill. As stated earlier, to provide an accurate comparison to the other options, the cost was converted into NPV. This results in an NPV cost estimate of $251 million for this option in total.

H.4 IDENTIFICATION OF THE REPRESENTATIVE PROCESS OPTION

In consideration of the three options evaluated in this appendix, Source Option 3 is identified as the representative process option to carry forward into Alternative 2 in the main body of the RI/FS report.

As the representative process option, Source Option 3 utilizes both the contaminated surface and near-surface soils and the subsurface soils from PORTS' groundwater contamination areas as the primary sources of OSDC fill — coupled with the concurrent removal of historical landfills from within the boundaries of Perimeter Road (EC-1 and EC-2).

In the short term, Source Option 3 has a higher cost compared to the clean fill options represented by Source Options 1 and 2. However, Source Option 3 has the potential to beneficially impact the final groundwater remedial actions that would be conducted under the Ohio Consent Decree and reduce the potential cost of such actions.

Decontamination and decommissioning (D&D) and waste disposition planning activities at the U.S. Department of Energy (DOE) Portsmouth Gaseous Diffusion Plant (PORTS) include the evaluation of on-Site waste disposal (Alternative 2) within an engineered on-Site disposal cell (OSDC) designed, constructed, operated, and closed to safely dispose of waste that would meet waste acceptance criteria (WAC) developed for such a potential OSDC. Waste that does not meet the WAC of such a potential OSDC would either be treated to meet the WAC or be disposed off Site at a DOE-approved waste disposal facility.

In accordance with *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) (Ohio Environmental Protection Agency [Ohio EPA] 2012), the Remedial Investigation (RI)/Feasibility Study (FS) is to include draft WAC. Per the DFF&O, WAC means "the criteria developed by Respondent with community input and approved by Ohio EPA which specify standards that must be met by each waste prior to its acceptance into any on-site disposal facility." WAC are the criteria which specify standards that must be met by each waste prior to its acceptance into a specific on-Site disposal facility. The WAC are comprised of prohibitions resulting from applicable or relevant and appropriate requirements (ARARs), as well as DOE operational decisions, and the six DFF&O components defined in Paragraph 5.mm as: (1) activity criteria and chemical concentration criteria, (2) waste evaluation and characterization standards, (3) waste physical characteristics standards, (4) waste packaging standards, (5) waste safe handling standards, and (6) waste transportation standards. A waste stream must meet each component before being allowed to be disposed in a potential OSDC.

The activity and chemical concentration WAC consider both results from fate and transport modeling to determine levels to ensure long-term protectiveness (performance-based criteria) and regulations that specify concentration limits for waste that may be placed in a potential OSDC. This appendix presents the fate and transport modeling completed to develop performance-based activity and chemical concentration WAC (referred to as modeled WAC).

I.1. INTRODUCTION

These performance-based activity and chemical concentration WAC (modeled WAC), are based on compliance with the long-term protectiveness requirements for a potential OSDC by applying fate and transport analysis conducted using conceptual design elements of a potential OSDC and industry-accepted groundwater and dose modeling approaches In development of draft modeled WAC, site-specific information obtained in accordance with the *Geotechnical Sampling and Analysis Plan for the Sitewide Waste Disposition Evaluation Project at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (DOE 2011a), referred to as the Geotechnical Sampling and Analysis Plan (SAP), such as hydraulic conductivity, distribution coefficient (K_d) values, etc., was used. Absent site-specific values, model default values, literature values, or values used in the PORTS-wide groundwater model, were used for the analysis and modified for specific geologic strata based on the site-specific uranium K_d relationships observed in the data. The modeling approaches used for this analysis are consistent with those described in *Work Plan for Modeling Analysis in Support of Regulatory Decisions at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (DOE 2011b).

I.2. REPRESENTATIVE OSDC LOCATION

I.2.1 REPRESENTATIVE LOCATION SELECTION AND FIELD INVESTIGATIONS

Appendix D of the *Remedial Investigation and Feasibility Study Report for the Site-wide Waste Disposition Evaluation Project at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio*, referred to hereafter as the waste disposition RI/FS, presents an analysis of four potential areas for siting a potential OSDC at PORTS, Study Areas A, B, C, and D (Figure I.1). Selection of a representative location, as well as development of a potential OSDC, requires data on hydrogeologic and geochemical properties of soil and rock for subsurface flow and transport modeling and modeled WAC development. Geotechnical data are also needed to determine soil properties such as subsidence, compaction, and permeability.

For these data collection efforts, several intrusive field methods were used to obtain the required geotechnical, geochemical, and analytical data, as outlined in the Geotechnical SAP (DOE 2011a). These methods include, but are not limited to, cone penetration testing, drilling in both unconsolidated and bedrock formations to collect soil samples for geotechnical and geochemical testing, and installation of monitoring wells and piezometers.

The Geotechnical SAP was written to ensure that the field investigation and sampling were performed in a technically acceptable manner. The specific types of data collected included the following:

- Hydrogeologic data such as depth to groundwater and vertical permeability for evaluating sites for a potential OSDC
- Geochemical data such as contaminant adsorption coefficients and fraction of organic carbon in soil to support modeling
- Geotechnical and analytical data from the four RI/FS study areas being evaluated
- Investigation of nearby surface water streams and installation of test pits to observe subsurface conditions.

Appendix D of the waste disposition RI/FS report evaluates the information available about each of the potential study areas. On the basis of geology, constructability, and public input, Study Areas A and B were removed from consideration. Study Areas C and D provide a superior level of protection and therefore were considered further. Study Area D in the northeast portion of the PORTS Facility was selected as the representative location for modeled WAC development because of the geology as well as improved operations and capacity for a facility at this location.

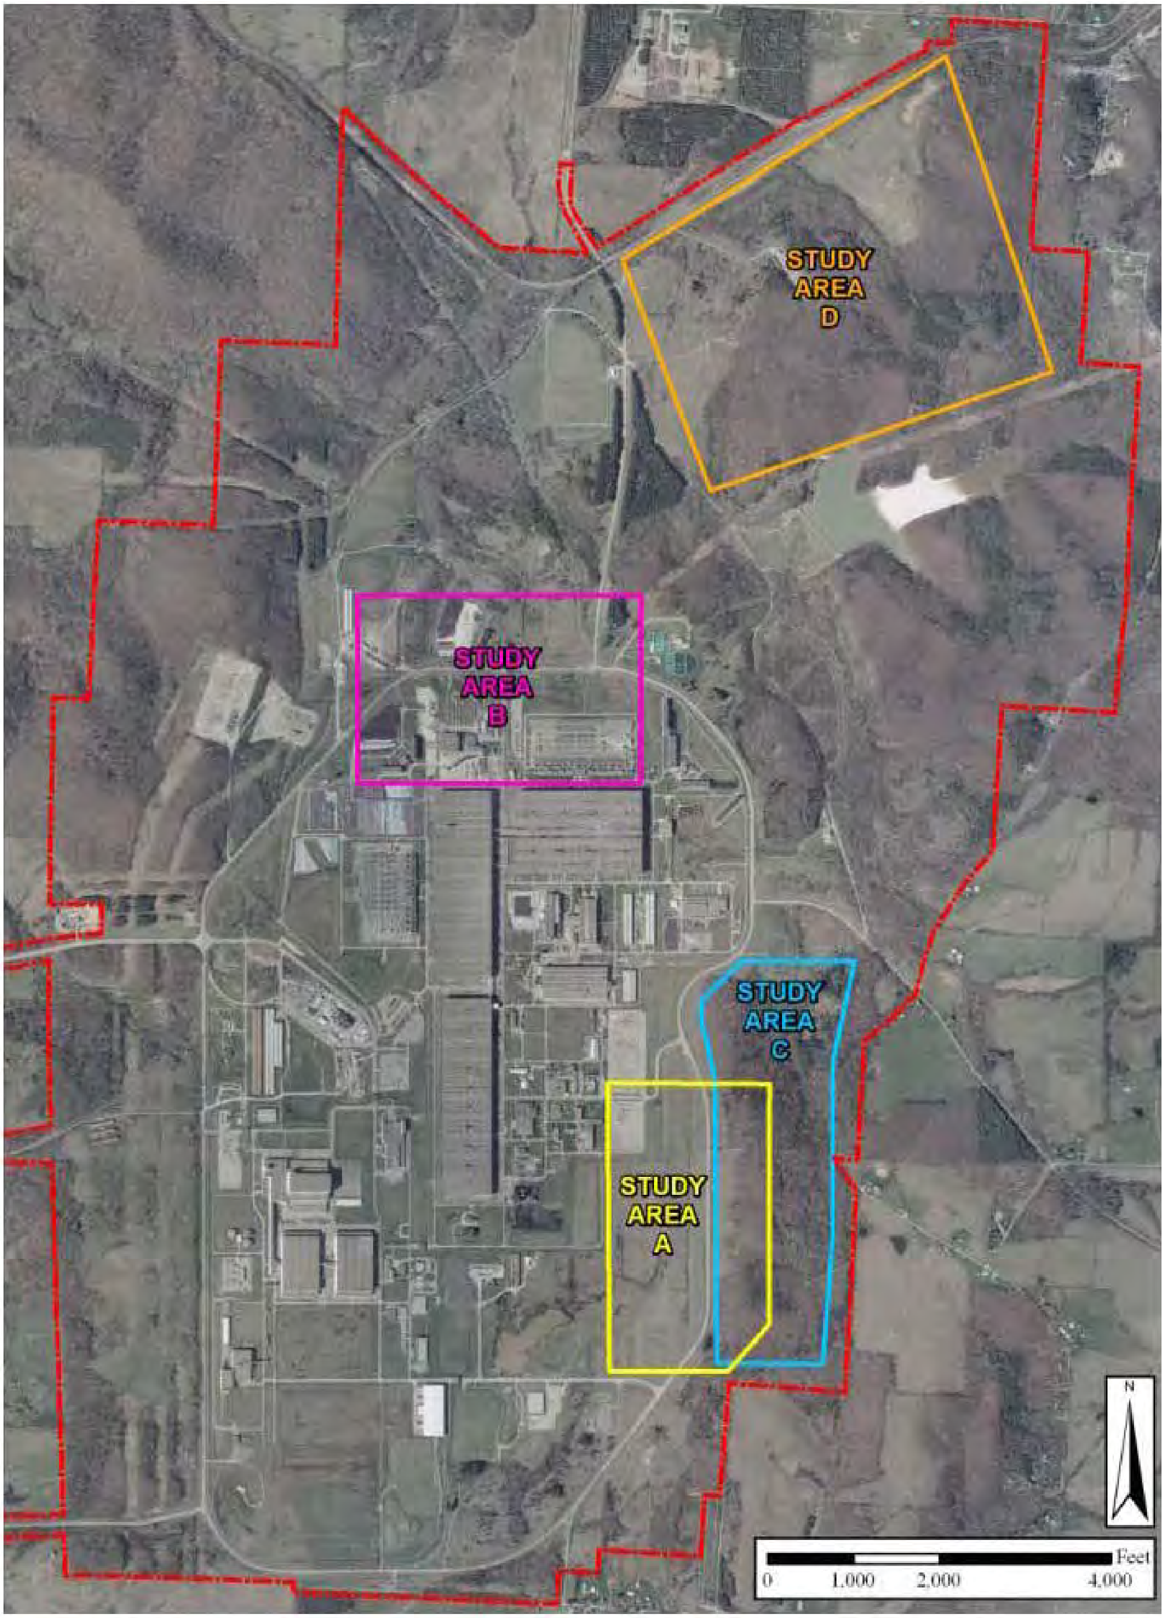

Figure I.1. Potential Study Areas for Waste Disposal at PORTS

I.2.2 HYDROGEOLOGIC CONDITIONS

A general cross section of the geology and hydrogeology of the PORTS study areas and the relative position of Study Area D are shown in Figure I.2.

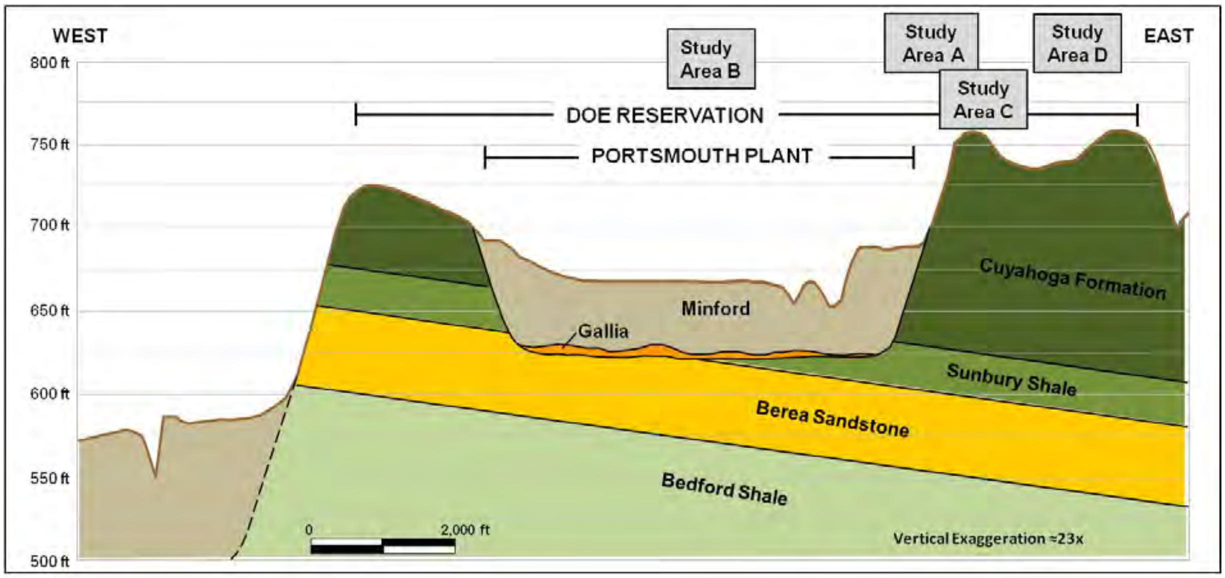

Figure I.2. Geological Cross Section of the PORTS Facility

Study Area D lies in an upland area predominantly outside the ancestral Portsmouth River valley. Stratigraphic units from oldest to youngest in age (Upper Devonian and Mississippi strata) include the Bedford shale, Berea sandstone, Sunbury shale, and Cuyahoga Formation. The Quaternary Teays Formation (Minford Member/Gallia Member) unconformably overlies the bedrock within the ancestral valley and pinches out on the western and northern flanks of the uplands.

The northern and western portions are underlain by the Minford/Gallia whereas most of the study area is underlain by the Cuyahoga Formation. Figure I.3 is a three-dimensional (3-D) representation of the major geologic formations at Study Area D. The depth to bedrock in Study Area D ranges from less than 10 ft in the upland areas to up to 40 ft deep on the western and northern boundaries. The Cuyahoga Formation is overlain by a combination of a thin veneer of Minford silt/clay and residual soil developed on the bedrock. The maximum thickness of the Cuyahoga Formation is estimated to be up to 120 ft where the uplands are at their greatest height. The Cuyahoga Formation is a moderately hard, thinly laminated shale with sandstone laminations. The Cuyahoga at Study Area D contains numerous thin (less than 3-in. thick) sandstone layers, and borings indicate a 2-ft-thick sandstone layer at an approximate elevation of 680 ft above mean sea level (AMSL). This layer is continuous across the study area. The sandstone layer extends outside of the study area eastward. This 2-ft-thick sandstone layer may be correlated to the 5-ft-thick “670 Sandstone Unit” at the Pike Sanitation, Inc. landfill located approximately 5 miles north-northwest of Study Area D (both units occur 30 to 40 ft above the contact between the Cuyahoga and Sunbury). Figure I.4 is a representation of the geologic formations at Study Area D showing the 2-ft-thick sandstone layer existing beneath Site D within the Cuyahoga shale and outcrops at several locations along the edges of the hillside, as well as the extent of this layer outside the DOE boundary. Currently, the water elevation in the X-611B Sludge Pond is approximately 680 ft AMSL, which is mostly above the elevation of the expected sandstone outcrops along the northern edge of the pond (approximately 675 – 681 ft AMSL). However, the assumed future condition of the X-611B Sludge Pond is that the water is drained and the remaining lime deposits are covered with soil to a final elevation at or below the elevation of the sandstone outcrops. This provides a natural discharge pathway from the sandstone layer.

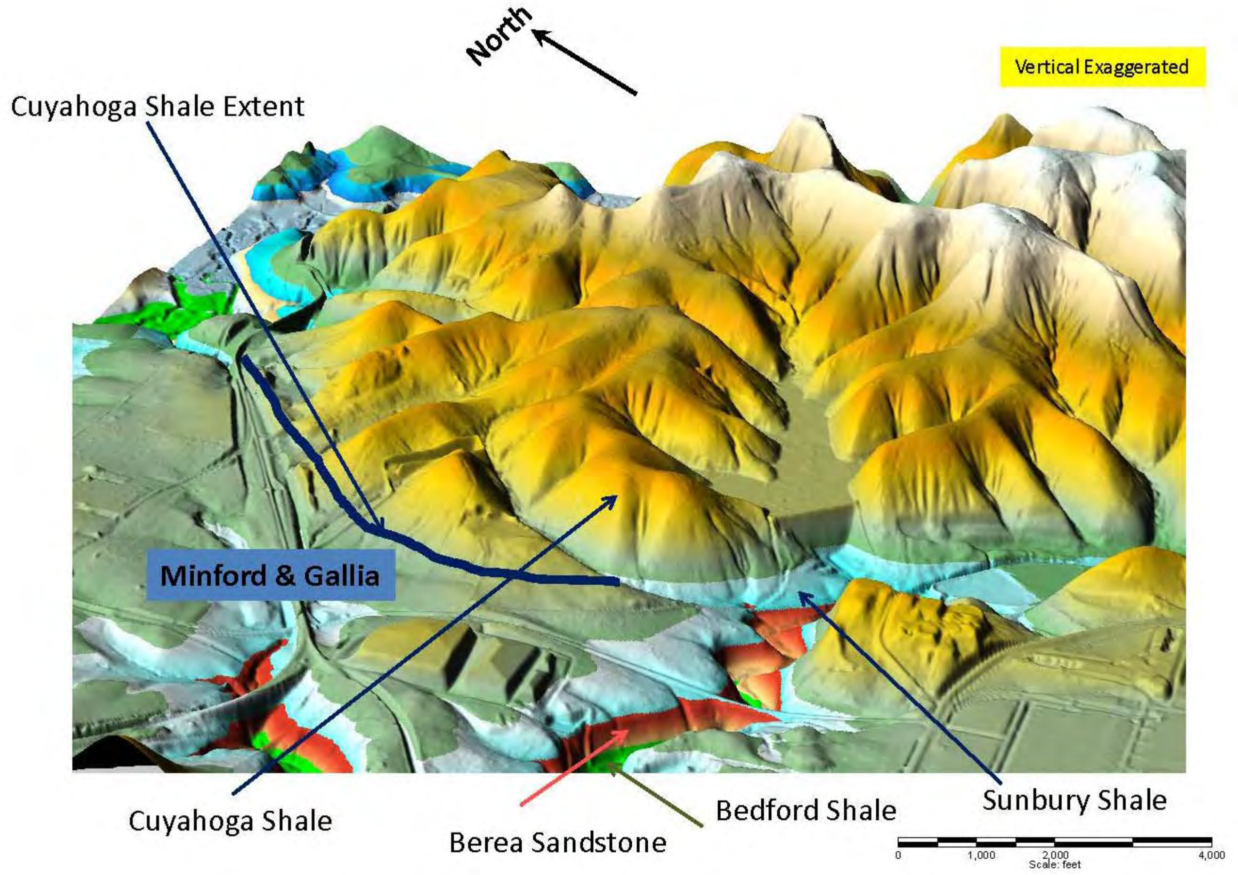

Figure I.3. Three-Dimensional Representation of Geologic Units at Site D

The Cuyahoga Formation also contains other thin, discontinuous sandstone layers with several layers occurring near the 720-ft AMSL horizon. These sandstone units are thinner (average approximately 0.5 ft thick) than the 680-ft sandstone layer and are not readily correlated from one boring to the next. These upper Cuyahoga Formation sandstone units have been grouped into geologic facies based on the presence of the different sandstone layers. The individual sandstone layers that comprise the 720-ft sandstone facies are difficult to correlate from boring to boring and do not appear to be continuous across Study Area D. Saturated conditions within the 720-ft sandstone facies appear to be limited or localized near the shallow hill slope area on the eastern side of the site.

The Cuyahoga is underlain by the Sunbury shale (approximately 20 ft thick) and the Berea sandstone (average thickness of approximately 35 ft) in the PORTS area. The Berea is composed of a light gray, hard, thickly bedded, fine-grained sandstone with thin shale laminations. The Berea sandstone overlies the Bedford shale. The bedrock formations dip gently to the east-southeast at approximately 30 ft/mile.

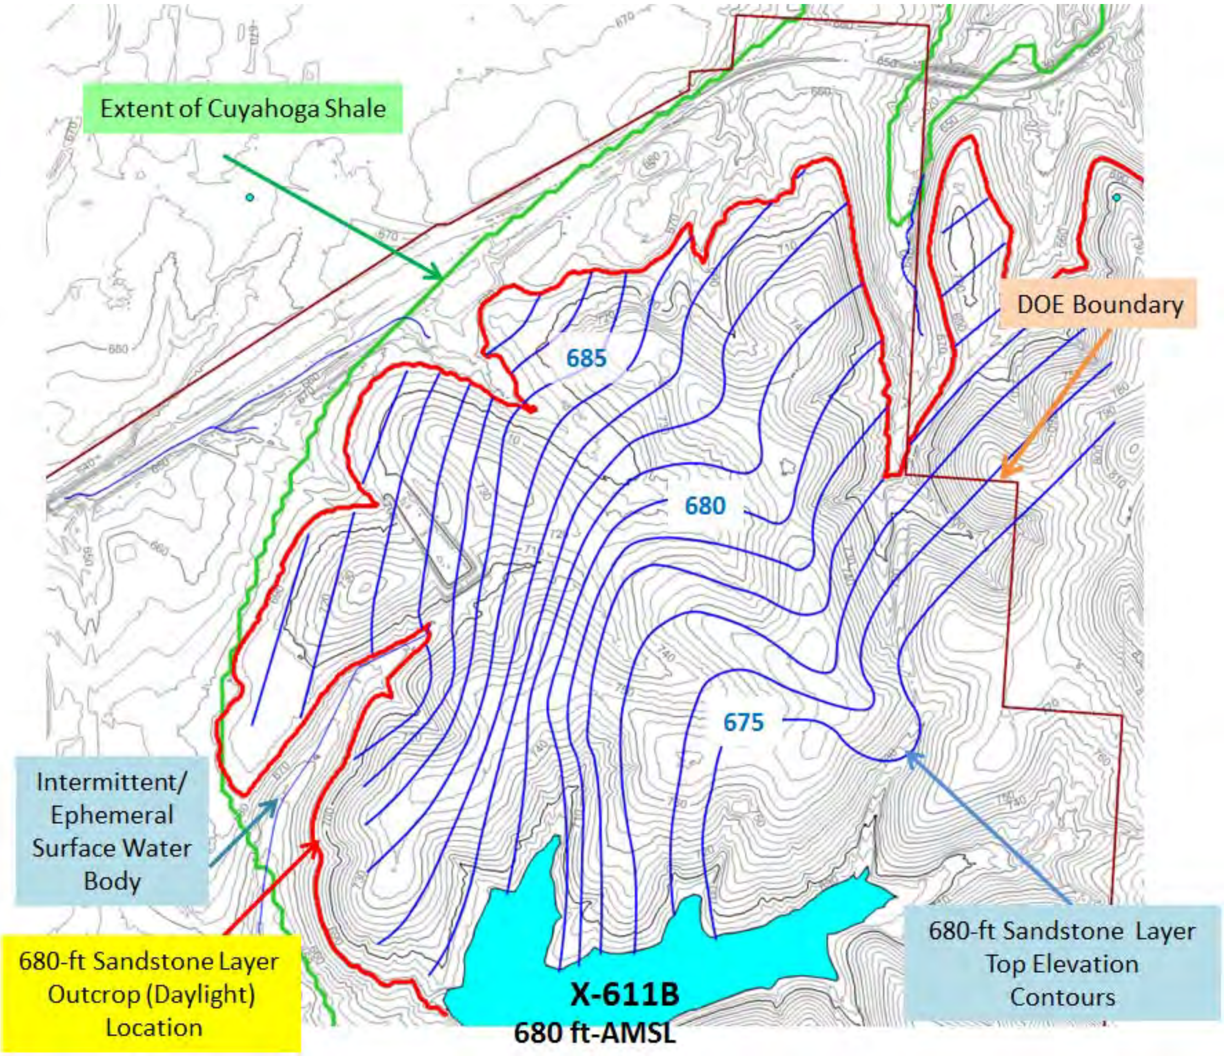

Figure I.4. Cuyahoga Shale and the Sandstone Layer Distribution and Exposure at Study Area D

The groundwater flow system at Study Area D includes the aquifers of the unconsolidated Gallia sand and gravel and the Berea sandstone, along with the aquitards of Cuyahoga/Sunbury shale, Bedford shale, and unconsolidated Minford clay and silt. The basal portion of the Minford is generally grouped with the Gallia to form the uppermost and primary aquifer beneath the industrial portion of PORTS. The Minford/Gallia are found only in the western and extreme northern portions of the study area and are absent in the upland areas where a potential OSDC would likely be located.

Natural recharge to the groundwater flow system comes mainly from precipitation, although land use and the presence of the bedrock shale units effectively reduce recharge to underlying units. Discharge of groundwater to the surface occurs primarily along streams that transect the plant. Natural recharge to the central portion of the plant is approximately 4 to 7 in./yr whereas recharge in the uplands, such as those at Study Area D (areas underlain by shale bedrock), is only 2 to 4 in./yr (Ohio Department of Natural Resources [ODNR] 2003). The recharge is less in the upland areas because of topography and low permeability of the bedrock and residual clayey soil. Water that infiltrates through the residuum likely moves laterally upon reaching the base of the deeply weathered zone because of the very low vertical permeability of the unweathered Cuyahoga Formation (1E-03 to 1E-05 ft/day).

Groundwater flow in the Gallia is essentially toward Little Beaver Creek and an unnamed tributary to Little Beaver Creek that lies west of the study area. The hydraulic gradient in the Gallia is low (ranging from less than 0.004 ft/ft to 0.015 ft/ft) with the steeper gradients existing closer to the discharge areas. Horizontal gradients measured in the Gallia during an 8-month period in 1994 averaged 0.0041 ft/ft. In the far western portion of Study Area D, groundwater flow in the Berea is towards the south-southwest, also discharging to Little Beaver Creek, with a gradient varying from less than 0.002 to 0.004 ft/ft (Figure D.26 in Appendix D of the waste disposition RI/FS report). Also, horizontal gradients measured at the same time in the Berea averaged 0.0025 ft/ft, slightly lower than that measured in the Gallia. Monitoring wells in the western portion of Study Area D showed no difference in water level elevation between the Gallia and Berea and suggest free groundwater exchange between the two units in this area. Within the remaining portion of Study Area D, groundwater flow in the Berea is predominantly eastward with a horizontal hydraulic gradient of approximately 0.006 ft/ft.

The thin sandstone layer within the Cuyahoga Formation may provide a significant zone of saturation. It appears saturated in portions of Study Area D. The horizontal permeability determined on tests of Berea sandstone cores ranges from 5.4E-03 to 9.9E-02 ft/day with a mean value of 2.0E-02 ft/day. Vertical permeability was slightly less than horizontal permeability with a mean value of 1.0E-02 ft/day. Based on tests of Berea cores from the X-737 area, the horizontal conductivity varied from 1 to 2.5 times greater than the vertical conductivity. Porosity of the Berea, measured in the western portion of Site D, was approximately 15 to 20 percent.

Borehole geophysical tools were used in selected soil borings at Study Area D to investigate the possible existence of fractures in the bedrock. An acoustic televiewer log was used because of its capability to provide an image similar to that of a video camera, and to provide azimuth and dip information for fractures and bedding structures. The data from this tool, used in conjunction with other geophysical tools described below, provided the location and orientation information for features such as fractures and lithologic contacts.

A suite of geophysical logs was collected in each piezometer in Study Area D, including caliper, natural gamma, single-point resistance, normal and lateral resistivity, and the digital acoustic televiewer. Variations in the resistance, resistivity, and natural gamma logs, in conjunction with the caliper and acoustic televiewer log responses, allowed the identification of lithologic changes and geologic features in the bedrock. Bedding plane fractures were noted at the upper bedding contact of the 2-ft-thick sandstone layer in piezometers WD-PZ08C and WD-PZ13C. No additional fractures or joints were identified in the geophysical logs. Additionally, a vertical fracture appears to exist as evidenced in WD-PZ09C, based on the geophysical log for this boring.

To visually assess the shallow subsurface bedrock features, a rock trencher was used to cut two vertical trenches in the bedrock (Cuyahoga shale) at two locations prior to excavating the rock between the trenches. Two parallel, 50-ft-long trenches were initially cut into the exposed rock surface to a depth of 4 ft. The trenches were 15 ft apart and ran in an east-west direction. Observations from the test pit included the following:

- Fractures seen on the surface of the 2-ft-thick sandstone in the Cuyahoga Formation continued throughout the thickness of the sandstone layer but did not extend into the underlying shale. Fractures in the 2-ft-thick sandstone layer also contained clayey soil approximately 0.5 in. thick.

- A 4-in.-thick sandstone layer was observed at a depth of approximately 4 ft. It was fractured in a fairly regular pattern with each piece exhibiting an average diameter of approximately 12 in. This layer was easily broken with the ripper attachment.

- Observed fractures and/or joints were limited to the more brittle sandstone layers. No fractures or joints were observed in the shale.

- The degree of weathering of the shale, as expected, diminished with depth. The moisture content of the shale was observed to be higher near the surface, and it decreased with depth.

- The bulldozer could easily remove the shale to a depth of 8 ft with the blade only, but a ripper attachment was needed to go deeper.

I.2.3 LABORATORY STUDIES AND GEOCHEMICAL CONDITIONS

Partition coefficient (K_d) analyses were performed to determine how species of uranium and technetium-99 in groundwater and soil partition between phases. This information is important in the analysis and evaluation of the retardation of uranium and technetium, the two primary contaminants of concern (COCs) at PORTS, and potential contaminant transport through the geologic strata. To obtain the most representative results, standard adsorption tests following American Society for Testing and Materials C 1733 were performed on collected soil/rock samples, using both contaminated groundwater from the plant and spiked water. The initial levels, or concentrations, of uranium and technetium-99 in the soil/rock samples and groundwater were determined by laboratory analyses. A summary of the results of the K_d analyses is listed in Table I.1 for the various geologic units at PORTS, including geometric means and arithmetic means (referred to as mean) of the data sets. All K_d results and laboratory reports are provided in Appendix C of the waste disposition RI/FS report. To be conservative, the lower values between the geometric means and the arithmetic means of these data are used in the modeling as described in Section I.5.2.2. These lower K_d values result in relatively higher mobility potential and therefore lower modeled WAC values. The exceptions are the Sunbury and Berea datasets in which the arithmetic means are used because the dataset is not large enough to calculate a geometric mean.

Table I.1. K_d Analytical Results for PORTS

Constituent	Geologic Unit	Min (mL/g)	Max (mL/g)	Median (mL/g)	Geometric Mean (mL/g)	Mean (mL/g)	Standard Error on the Mean (mL/g)	Number of Samples
Technetium-99	Waste	2.02	2.05	NA	NA	2.035	0.015	2
	Minford	2.72	4.97	4.01	3.79	3.84	0.16	15
	Gallia	4.32	8.16	7.29	6.36	6.59	1.16	3
	Regolith[1]	3.08	5.93	4.28	4.29	4.37	0.25	12
	Cuyahoga	3.17	8.86	4.33	4.60	4.87	0.83	6
	Cuyahoga (sandstone layer)	3.27	3.49	3.38	3.38	3.38	0.11	2
	Sunbury	130	303	217	198	217	86.5	2
	Berea[2]	3.29	3.38	3.34	3.33	3.34	0.045	2
Uranium	Waste	246	634	NA	NA	440	194.03	2
	Minford	3.67	118	10.4	14.2	26.1	11.1	10
	Gallia	12.3	118	15.3	28.1	48.5	34.7	3
	Regolith[1]	4.20	687	17.9	22.6	77.6	55.6	12
	Cuyahoga	2.04	58.5	7.03	6.60	14.82	8.96	6
	Cuyahoga (sandstone layer)	64.4	71.7	68.1	68	68.1	3.65	2
	Sunbury	757	757	NA	NA	NA	NA	1
	Berea[2]	1.13	1.94	1.54	1.48	1.54	0.41	2

[1] Regolith consists of in place weathered materials above the Cuyahoga shale.
[2] Discrepencies in the K_d results for the geologic units are due to differing geochemical conditions within the units which alter the sorption affinity of both technetium-99 and uranium.

Max = maximum detected value
Min = minimum detected value
NA = not applicable

I.2.4 CONCEPTUAL SITE MODEL

Development of a conceptual site model (CSM) is necessary prior to evaluating the likely impact of potential contaminants that might emanate from a potential OSDC at Study Area D. A CSM is a visual representation that identifies the types and locations of all potential sources and how and where exposure may occur. Figure I.5 illustrates the current condition CSM. This figure illustrates the relative ground elevations (vertically exaggerated) along with the underlying geology previously discussed for Study Area D. Visually establishing the current conditions from a geological/hydrogeological perspective ensures that the important components of the site are identified and an understanding of how they may be modified by or affected by the potential construction of a disposal facility at Study Area D is important to development of a future condition CSM.

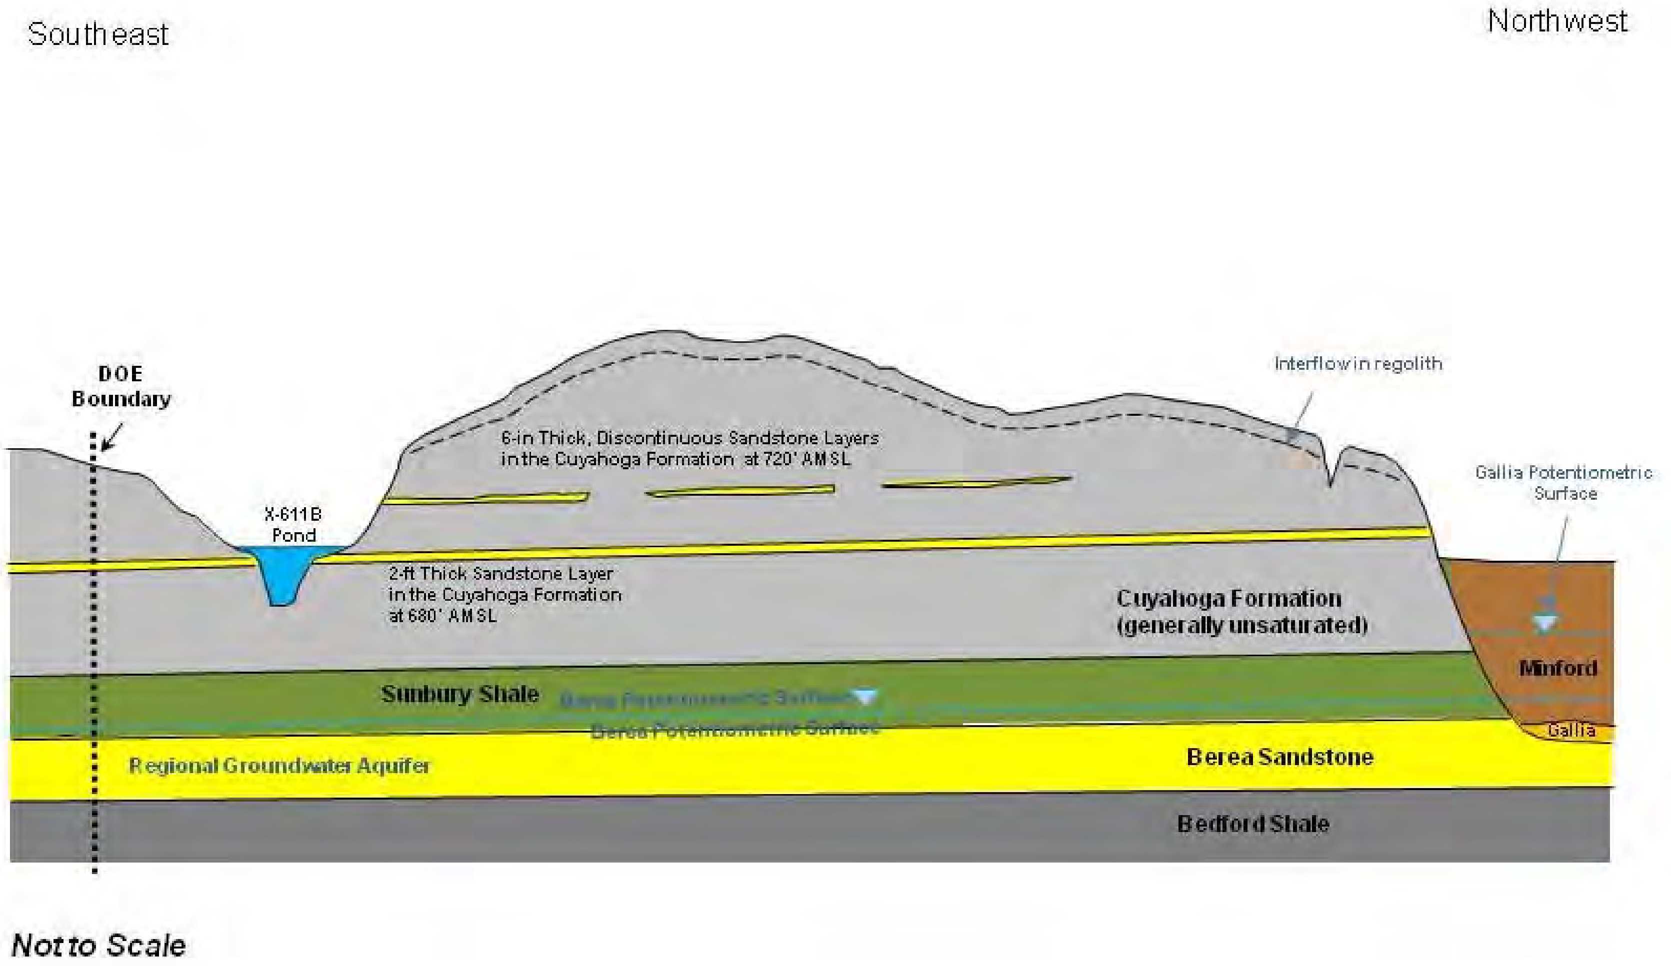

Figure I.5. Conceptual Site Model for PORTS Modeled Waste Acceptance Criteria – Current Condition

A future condition CSM identifies the key elements of fate and transport, which include the media that the contaminants may move through and the receptor that could become exposed to such contaminants. The locations of these receptors are termed point of assessment (POA) or point of compliance (POC) and are used to define the exposure assumptions that are to be considered in the modeled WAC development. A POA is a point at which it is assumed that a receptor may come in contact with media that may be contaminated by a potential OSDC based on fate and transport modeling and current and future site characteristics. POA locations are selected based on water flow directions beneath the site and likely future use scenarios in the vicinity of a potential OSDC, resulting in potential exposure to a receptor. Based on characteristics of the relevant exposure media and locations, specific exposure scenarios apply to the POAs which are considered in the development of modeled WAC to ensure protection of human health and the environment. The POC is a regulatory-driven requirement and is the basis for future monitoring of groundwater in the regional aquifer. The following summarizes the POAs and the POC that are to be evaluated in the WAC modeling for a potential OSDC:

- POA-1: maximum impacted surface water/sediment at the 680-ft sandstone discharge.

- POA-2: maximum impacted groundwater at facility boundary (300 ft from waste boundary [i.e., unit boundary]) within the 680-ft sandstone layer.

- POA-3: maximum impacted groundwater at facility boundary (300 ft from unit boundary) within the Berea sandstone under an open borehole configuration to allow for mixing from the 680-ft sandstone layer. (Note – under this POA scenario it is assumed that well water is withdrawn from the regional groundwater aquifer [Berea sandstone] in which an open borehole configured well is the only hydraulic connection between the regional groundwater aquifer and the shallow zone of saturation [i.e., 680-ft sandstone layer located immediately downgradient from the potential OSDC.])

- POA-4: maximum impacted groundwater/surface water under a future residential farmer scenario.

- POA-5 maximum impacted groundwater in Berea sandstone in the nearest downgradient point along the DOE property boundary which represents potential impacts of a potential OSDC to the regional groundwater aquifer (potential impacts to the Berea sandstone from the 680-ft sandstone layer is limited due to a greater distance from the waste).

- POC: groundwater monitoring at a point in the Berea sandstone at the downgradient edge of the unit boundary.

While this future condition CSM is a simplification of the fate and transport processes, it provides a visualization and general understanding of the potential impacts from a potential OSDC that are used to develop the WAC modeling processes.

Figure I.6 illustrates the future condition CSM applicable to Study Area D and, specifically, the primary steps in the modeled WAC development process for the constituents expected to be present in waste that could migrate from a potential OSDC to the applicable POA or POC. The steps include the following:

Step 1 Developing a source term for each constituent for the waste

Step 2 Estimating the infiltration rate for water moving through the cap and into the waste mass

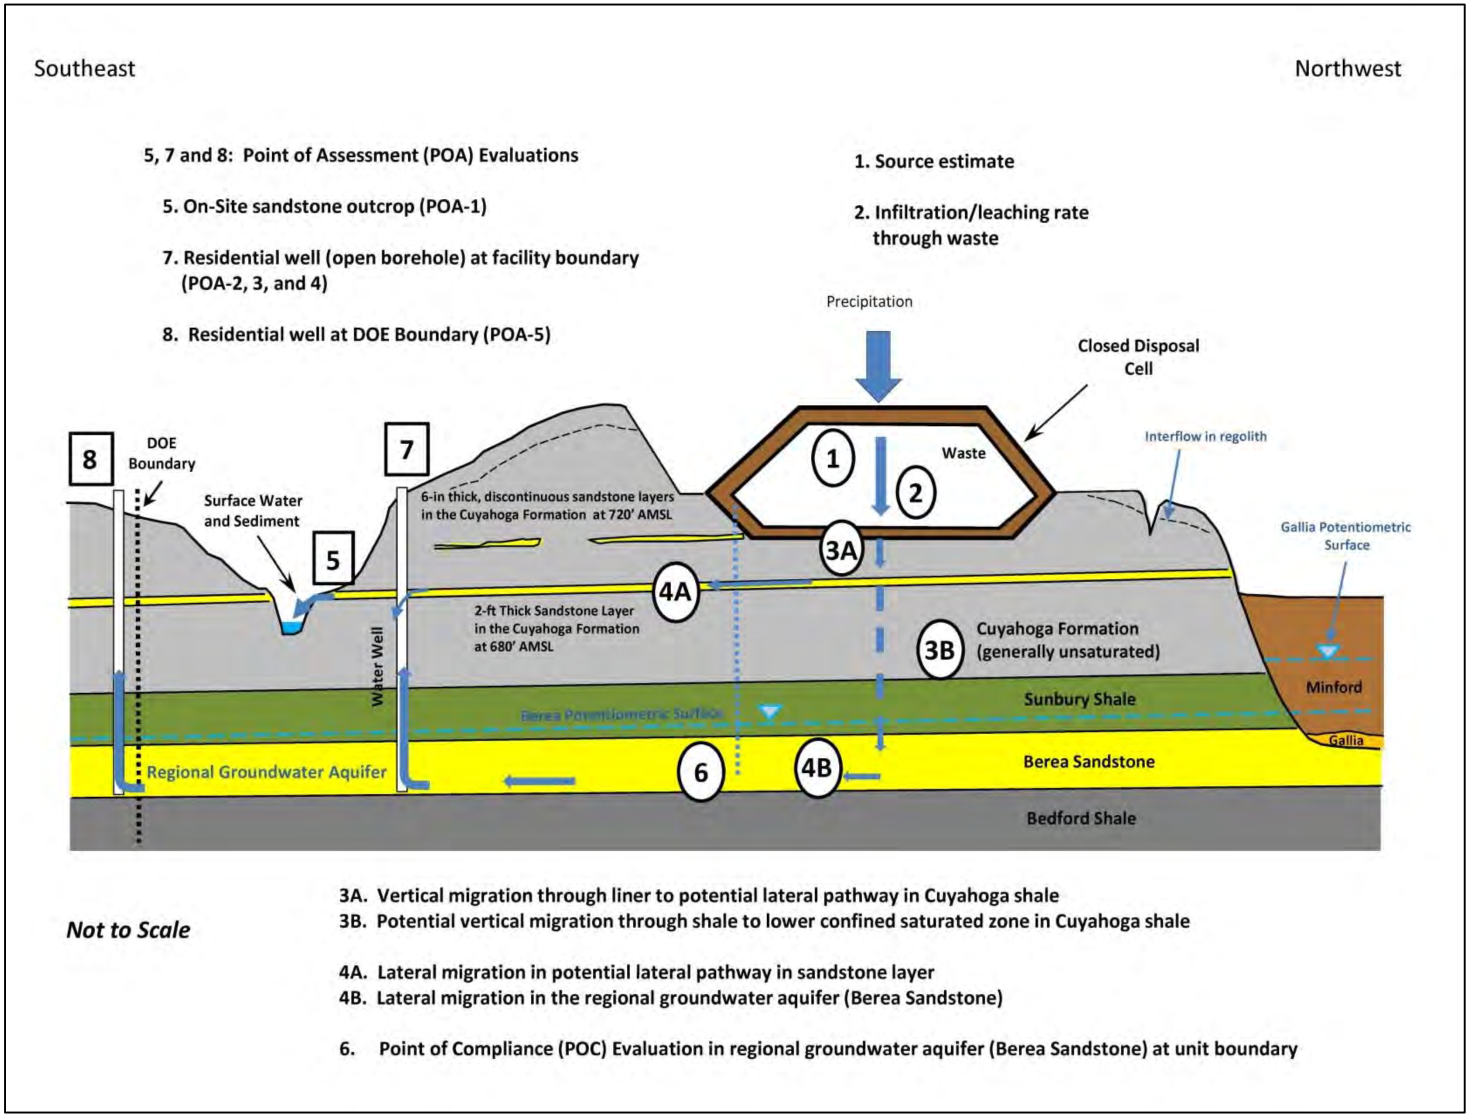

Figure I.6. Conceptual Site Model for PORTS Modeled Waste Acceptance Criteria – Future Condition

Step 3 Estimating the leaching rate of each constituent through the base liner materials and various layers (vadose and saturated zones) beneath the OSDC

Step 4 Predicting the lateral migration through the saturated zones (water bearing 2-ft sandstone layer in the unsaturated Cuyahoga Shale and regional Berea groundwater aquifer) within the compliance period of 1,000 years

Step 5 If applicable, estimating the contaminant concentration in surface water and sediment at POA-1 (sandstone outcrop) in the maximum impact direction from the OSDC within the compliance period of 1,000 years under a recreational exposure scenario

Step 6 If applicable, estimating the contaminant concentration in groundwater at the POC within the compliance period of 1,000 years

Step 7 If applicable, estimating the contaminant concentrations in groundwater at POA-2, POA-3, and POA-4 within the compliance period of 1,000 years and using maximum contaminant levels (MCLs)/risk-based concentrations for POA-2 and POA-3, and risk-based concentrations for all pathways under a future residential farmer scenario for POA-4

Step 8 If applicable, estimating the contaminant concentration in groundwater at POA-5 within the compliance period of 1,000 years using MCLs/risk-based concentrations.

The footprint for a potential OSDC at Study Area D and the basis for the CSM are the conceptual design described in Section 8 and drawings presented in Appendix J of the waste disposition RI/FS report. For purposes of modeled WAC development, a footprint applicable to an 11 cell, 5-million-cy capacity requiring 66 acres is assumed. The bottom liner of the facility is to be built on competent Cuyahoga shale in order to provide a stable base. As noted in the facility cross sections in Appendix J, the bottom elevations of the individual cells are cut below the existing grade elevation between approximately 10 ft and 45 ft. Therefore, construction of a potential OSDC at Study Area D would result in excavation of the weathered zone (i.e., regolith) within the footprint. Additionally, the bottom elevations of much of the base liner are below the discontinuous sandstone layer identified at 720 ft AMSL resulting in excavation of much of this sandstone. Excavation and/or isolation of the 720-ft sandstone layer under the potential OSDC during liner construction will be specified in the final design of the sub-grade to sufficiently eliminate this layer from becoming a lateral pathway for potential leaks to migrate outside of the potential OSDC footprint. Monitoring of the remaining portion of this layer outside but adjacent to the potential OSDC will also be conducted as part of the overall potential OSDC monitoring system. Therefore, no additional engineered features would be necessary to address the shallow subsurface water flow beneath a potential OSDC at Study Area D.

For each constituent that is modeled to reach the POA or POC within the compliance time frame, draft modeled WAC are derived using the ratios of risk-based or regulatory-based performance standards to model-predicted values to derive the maximum concentrations or maximum activity of COCs that may be placed in a potential OSDC at Study Area D.

I.3. WASTE STREAMS, WASTE ACCEPTANCE CRITERIA CONTAMINANTS, AND PERFORMANCE STANDARDS

Most of the waste planned to be generated is building waste (regulatory category [RC]-1, engineering category [EC]-2), the majority of it from the three large process buildings. The primary contaminants at PORTS are radionuclides, but other contaminants such as metals, organics, etc. are present. The large volume of soil assumed to be generated under the Ohio Consent Decree (RC-2, EC-1) is uncertain because remedial action objectives have not yet been established, and the soils beneath the process buildings and across much of PORTS have not been fully characterized. Soil brings a host of additional contaminants to the waste streams, which must be managed in a safe and compliant manner. In general, most of the waste streams are classified as low-level waste. Section I.3.1 discusses the waste types and volumes which subsequent sections discuss how contaminants were selected for modeled WAC development.

I.3.1 WASTE STREAMS, WASTE FORMS, AND CONTAMINANTS

The vast majority of waste expected to be generated during D&D of PORTS (RC-1) would originate from the three large gaseous diffusion process buildings, X-326, X-330, and X-333. The waste volumes include the structure of each facility, all process gas equipment (PGE) (except from X-326) and industrial equipment within each facility, and facility slabs. The balance of the expected volume is from hundreds of smaller buildings and man-made structures. This volume of waste requiring fill (RC-1, EC-2) (1.4 million cy) requires a disposal facility with a total capacity of approximately 3.9 million cy, assuming an EC-1/EC-2 ratio of 2 to 1. However, as a contingency for containing additional waste that may be generated at PORTS, a disposal facility with a total capacity of 5 million cy is assumed for modeled WAC development.

The primary waste forms associated with D&D of PORTS (RC-1) requiring on-Site disposal are as follows:

- Other building waste
- Concrete waste
- PGE waste
- Residual soils.

While not all of these wastes are candidates for disposal on Site, there would be large portions of each waste form that would be able to meet a potential OSDC WAC.

A starting point for characterization of the waste expected to be generated is identifying and understanding the processes that created radiological and/or chemical waste. Most of the effort in developing waste types has focused on the three process buildings because D&D at these facilities would generate a majority of the waste volume.

The primary radiological COCs within the process buildings are uranium (uranium-234, uranium-235, uranium-238) and technetium-99. The uranium contamination results from the gaseous diffusion process. Most of the technetium-99 was introduced into the cascade system either as direct feed of reactor returns or through feeding of Paducah product (UF_6) material. Radionuclides introduced into the gaseous diffusion system from the processing of reactor returns were typically generated through the plutonium uranium extraction PUREX process. A byproduct of this process was uranium trioxide, which was returned to the uranium feed cycle for the production of UF_6 feed materials. The PUREX process was highly efficient at separating out fission products and transuranic elements from its product streams.

However, for some radionuclides, the PUREX separation process was not fully effective. These reactor returns were introduced into the gaseous diffusion process to facilitate increased production and reduced reliance on commercial uranium ore mining and milling. As a result, the contaminants present in the feed materials generated from reactor returns are known to have contained measurable concentrations of fission products and transuranic elements, including most notably technetium-99, neptunium-237, and plutonium-239. Small quantities of transuranic elements, neptunium-237 and plutonium-239, are also suspected of being introduced into PORTS during the feeding of reprocessed uranium feed stock.

Exterior surface uranium contamination exists in all three PORTS process buildings (X-326, X-330, and X-333). Contamination resulted from maintenance activities and infrequent leaks of process gas during greater than atmospheric pressure operations in the X-330 and X-333 Buildings. Both fixed and removable contamination can be found on the operating and cell floors.

Chemical trapping materials in the process buildings include alumina, such as aluminum oxide (Al_2O_3) and sodium fluoride (NaF). These trapping materials contain elevated concentrations of uranium, hydrogen fluoride, technetium-99, and heavy metals. The alumina traps were used as final filtration before discharge of light gases to the atmosphere. Sodium fluoride was used to recover UF_6 from purge gas streams before return to the cascade and final purging. Magnesium fluoride (MgF_2) side-stream traps were installed in the X-326 Building (Cells 25-7-15, 17, and 19) to remove technetium-99 in the top of the cascade. This trapping system was successful in reducing the cascade technetium-99 inventory, but created a source of concentrated technetium-99 trap media. Also, there is an assumption that plutonium and neptunium may also be present on the magnesium fluoride trapping material. The traps have been disconnected from the cascade. Currently, they are compliantly stored in the X-326 Building (on the operating floor).

The primary COCs are polychlorinated biphenyls (PCBs), metals, asbestos, and strong oxidizing agents (as described in Section 5 of the waste disposition RI/FS). PCBs from electrical capacitors, transformers, and impregnated ventilation gaskets; metals such as lead and silver solder from tube fittings and other applications; cadmium and other metals from alloys and trapping materials; strong oxidizing agents from the residual UF_6 (fluorine); and hydrogen fluoride are anticipated to be present.

Initially, the PORTS recirculating cooling water (RCW) treatment system contained hexavalent chromium to prevent corrosion. In the 1990s, treatment of the cooling water was changed to a more environmentally acceptable phosphate-based system. Therefore, residual chromate and phosphate compounds are anticipated in the RCW system within the three process buildings. In addition, residual chromate is likely to be present in cooling towers and possibly other PORTS RCW support systems.

Residual amounts of hydrocarbon oils used to lubricate the process compressors and motors may be encountered in the lubricating oil headers, filters, tanks, and hydraulic lines, once drained from the system.

Small amounts of mercury are contained in various specialized instruments essential to the proper functioning and operation of the process equipment. For example, mercury is commonly found in temperature/pressure contact switches, chemical traps, fire pull stations, and mercury vapor lamps used for high-bay lighting (Theta Pro2Serve Management Company, LLC [TPMC] 2006). The X-326 Building instrument and sampling lines contain small mercury traps that were used to remove corrosive gases within the line and prevent damage to the mass spectrometer line recorders.

Arsenic may be found primarily in the X-326 Building instrument lines and sampling lines as a result of treatment gases. Beryllium is present in aluminum compressor blades and compressor impellers in low parts-per-million quantities.

I.3.2 MODELED WASTE ACCEPTANCE CRITERIA CONTAMINANT OF CONCERN SELECTION PROCESS

A qualitative human health and ecological risk assessment was conducted to assess the threat of contamination in the buildings at PORTS if no action is taken in the future and the buildings are allowed to degrade with no waste disposed. This assessment (Section 5 of the waste disposition RI/FS) identified the following COCs in the buildings at PORTS:

- Uranium isotopes (uranium-234, uranium-235, and uranium-238)
- Total uranium
- Technetium-99
- Asbestos-containing material (ACM)
- Trichloroethene
- PCBs (Aroclor-1254, Aroclor-1260)
- Chromium (including chromium III and VI).

These contaminants require an assessment of potential fate and transport through a potential OSDC into the underlying media. Because ACM is only a threat through inhalation and not a viable pathway from a closed cell, the compound was not modeled.

The risk assessment was qualitative and based on process knowledge. Existing data suggest that other contaminants are present, they could be placed in the OSDC, and such potential placement merits consideration. Based on existing analytical data from the process equipment, the following contaminants have also been assessed:

- Thorium-228
- Thorium-230
- Uranium-236
- Neptunium-237
- Plutonium-238
- Plutonium-239/240
- Americium-241.

Based on existing analytical data from the environmental media, the contaminants in Table I.2 have also been assessed as they may be present in other waste streams generated under the Ohio Consent Decree (RC-2) or as fill (RC-2, RC-3, EC-1) used in the operations of a potential OSDC. This list is derived by tabulating every COC that exceeded remedial action objectives or preliminary remediation goals in previous quadrant-specific Resource Conservation and Recovery Act of 1976 (as amended) (RCRA) Facility Investigations (DOE 1996a, 1996b, 1996c, 1996d), Corrective Measure Study documents (DOE 1998a, 1998b, 2000, 2001), the PORTS Baseline Human Health Risk Assessment (DOE 1995a) and the PORTS Baseline Ecological Risk Assessment (DOE 1996e), with the exception of naturally occurring daughter isotopes in the uranium and thorium decay chains. Data presented in these documents represent releases from activities that originally occurred in or around the buildings or as a result of waste generated in the buildings. As such, these contaminants are present in environmental media that may be candidates for disposal in a potential OSDC.

Table I.2. Modeled Waste Acceptance Criteria Contaminants of Concern from PORTS Environmental Data

Organic Constituents		Inorganic Constituents
Acenapthylene	Endosulfan II	Antimony
Benzene	Endosulfan sulfate	Arsenic
Benzo(a)anthracene	Endrin ketone	Barium
Benzo(a)pyrene	Ethylbenzene	Beryllium
Benzo(b)fluoranthene	Heptachlor	Cadmium
Benzo(g,h,i)perylene	Hexachlorobenzene	Cobalt
Benzo(k)fluoranthene	Hexachlorocyclohexane-alpha	Copper
Bis(2-chloroethyl)ether	Hexanone, 2-	Cyanide
Bromoform	Indeno(1,2,3-cd)pyrene	Fluoride
Butanone, 2-	Methoxychlor	Lithium
Carbon Tetrachloride	Methylnaphthalene, 2-	Manganese
Chlordane-gamma	Napthalene	Mercury
Chloro,3-methylphenol, 4-	Nitrobenzene	Nickel
Chloroform	Nitrobenzeneamine, 4-	Selenium
Chrysene	Nitrophenol, 4-	Silver
Dibenz(a,h)anthracene	n-Nitroso-di-n-propylamine	Vanadium
Dibenzofuran	Phenanthrene	Zinc
Dibromochloromethane	Tetrachloroethene	
Dichloroethane, 1,2-	Toluene	
Dichloroethene, 1,1-	Tribromomethane	
Dichloroethene, 1,2-	Trichloroethane, 1,1,1-	
Dieldrin	Trichloroethane, 1,1,2-	
Dimethylphthalate	Vinyl acetate	
Dinitrotoluene, 2,4-	Vinyl chloride	

As previously mentioned, a contingency volume is assumed for sizing a potential OSDC. Because this additional waste may contain constituents that could be classified as hazardous waste under RCRA, a consideration is made to include all constituents that are found on the Toxicity Characteristic Leaching Procedure (TCLP) table in 40 *CFR* 261. Table I.3 identifies additional modeled WAC COCs from the TCLP list.

Table I.3. Additional Modeled Waste Acceptance Criteria Contaminants of Concern from Toxicity Characteristic Leaching Procedure List

Organic Constituents		Inorganic Constituents
Chlordane	Methylphenol, 3- (m-Cresol)	Lead
Chlorobenzene	Methylphenol, 4- (p-Cresol)	
Cresol	Pentachlorophenol	
Dichlorobenzene, 1,4-	Pyridine	
Endrin	Toxaphene	
Hexachlorobutadiene	2,4-D	
Hexachloroethane	2,4,5-TP (Silvex)	
Lindane	2,4,5-Trichlorophenol	
Methylphenol, 2- (o-Cresol)	2,4,6-Trichlorophenol	

Finally, a review of landfills at the former DOE Oak Ridge K-25 site (now East Tennessee Technology Park), which are similar to those at PORTS, was performed in order to identify additional constituents for WAC modeling. These landfills (i.e., K-1070-A and K-1070-B landfills) received waste items and materials from the gaseous diffusion process and have been sampled and profiled for disposal at the on-site waste disposal facility in Oak Ridge. Using these data as proxy for the similar landfills at PORTS and comparing the maximum detected concentrations or activity concentrations to risk-based concentrations results in the addition of 8 organic constituents. Table I.4 identifies the additional modeled WAC COCs for PORTS.

Table I.4. Additional Modeled Waste Acceptance Criteria Contaminants of Concern Consistent with Similar Landfills at other DOE Sites

Organic Constituents
Acetone
Aroclor-1242
Anthracene
Methylene chloride

Source: Bechtel Jacobs Company LLC 2010.

I.3.3 PERFORMANCE STANDARDS

The performance standards for modeled WAC development are consistent with the remedial action objectives presented in Section 7.3 of the waste disposition RI/FS. Risk-based performance standards ensure that the excess lifetime cancer risk (ELCR) for each constituent is set at 1E-05 and the hazard quotient is set at 1. The regulatory-based performance standards consist of MCLs for protection of human health and Ohio ambient water quality criteria (AWQC) for the protection of aquatic species.

Based on the previously described POAs, the following receptors and exposure pathways are considered for the POAs:

- Recreational scenario (POA-1) – includes incidental ingestion and dermal contact with sediment and surface water potentially emanating from the 680-ft sandstone layer

- Ecological receptors (POA-1) – includes AWQC from *Ohio Administrative Code (OAC)* 3745-1-07 applicable to surface water potentially emanating from the 680-ft sandstone layer

- MCLs in groundwater (POA-2, POA-3, and POA-5) from the U.S. Environmental Protection Agency (EPA) publication *National Primary Drinking Water Regulations* (EPA 2009)

- Future residential farmer scenario (POA-4) – includes groundwater ingestion and ingestion of food crops and animal products (milk and beef) irrigated and watered with surface water and/or groundwater, as applicable.

The sources of the performance standards are as follows:

1) For sediment, values are calculated using the DOE Risk Assessment Information System (RAIS) with user-defined, site-specific exposure parameters consistent with *Methods for Conducting Human Health Risk Assessments and Risk Evaluations at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio,* (DOE 2011c) (referred to as the Risk Methods Document [RMD]) under a recreational teen exposure scenario (scaled to a hazard quotient of 1 or ELCR of 1E-05) (blue highlight).

2) For surface water, values are from RMD (yellow highlight) and RAIS (blue highlight) for constituents not listed in the RMD.

3) Ecological standards are from *OAC* 3745-1-70, Table 7-1, inside the mixing zone (green highlight).

4) MCLs are from EPA 2009 (orange highlight).

5) For groundwater and ingestion of vegetables, milk, and beef under a future resident farmer, all values are from RAIS (blue highlight).

The performance standards used in the derivation of modeled WAC are shown in Table I.5.

It should be noted that the radionuclide performance standards are risk- or ARAR-based. These standards are either equivalent to a 1E-5 ELCR, in the case for the recreational and resident farmer scenarios, or are based on the MCL for alpha or beta activity-related nuclides for groundwater exposure. *OAC* 3701:1-54-08(B)(1) requires that concentrations of radioactive material released to the general environment in groundwater, surface water, air, soil, plants, and animals must not result in an annual dose exceeding the equivalent of 25 mrem to the whole body, 75 mrem to the thyroid, or 25 mrem to any other organ to any member of the public. The risk- and ARAR-based performance standards meet (or exceed) this requirement. First, the risk-based performance standard concentrations are based on an ELCR that is nearly an order of magnitude lower than the equivalent risk associated with an annual dose of 25 mrem/yr to the whole body or any organ, which according to EPA equates to an approximate 5E-4 ELCR (EPA 1997), and an order of magnitude lower than the equivalent risk associated with an annual dose of 75 mrem/yr to the thyroid. Second, the MCL-based performance standards equate to an annual dose of between 2 and 11 mrem/yr to the whole body or any organ, again lower than the required dose.

Notes:
Yellow: PORTS RMD, Table 1, scaled to ELCR of 1×10^{-5} or hazard quotient of 1.
Blue: DOE's RAIS at http://rais.ornl.gov/ using exposure factors consistent with PORTS RMD document.
Green: *OAC* 3745-1-07, Table 7-1 and 7-9, IMZM classification
Orange: EPA 816-F-09-004, May 2009.

Because the performance standards are risk-based using typical exposure parameters, some constituents have standards greater than unity (that is 100%). This is an artifact of the method for calculating the performance standards and where this occurs, the physical limit becomes the *de facto* standard.

COC = contaminant of concern
DOE = U.S. Department of Energy
EPA = U.S. Environmental Protection Agency
IMZM = inside mixing zone maximum
MCL = maximum contaminant level
NV = no value

OAC = Ohio Administrative Code
POA = point of assessment
PORTS = Portsmouth Gaseous Diffusion Plant
RAIS = Risk Assessment Information System
RMD = Risk Methods Document

I.4. PRELIMINARY OSDC DESIGN

A conceptual design for a potential OSDC has been used for modeling and considers the volumes and types of waste (radiological and chemical waste streams) potentially projected to be placed in such a facility, consistent with those presented in Section 4 of the waste disposition RI/FS report. Because a potential OSDC would manage waste with RCRA, Toxic Substances Control Act of 1976, and radioactive contaminants, the conceptual design incorporates a number of elements associated with the various design requirements in the waste management regulations for each of these waste types. This includes a multilayer base liner system and a multilayer cap system. Understanding the physical design of a potential OSDC is essential to properly account for the impact of these design features in modeling contaminant transport. The description of a potential OSDC herein is for illustrative purposes only as the basis for draft modeled WAC development, and it should not be construed that Alternative 2 has actually been selected.

I.4.1 OSDC FOOTPRINT AND LAYOUT

A potential OSDC assumed in this modeled WAC analysis considers a 5 million cy volume capacity facility, which is the volume necessary to contain the DFF&O waste as well as additional waste that may be generated during the cleanup of PORTS. The disposal cells at Study Area D would sit on a topographic high area (Figures I.7 and I.8) and entirely on top of competent Cuyahoga shale, which includes both weathered shale and competent shale. The depth to bedrock in Study Area D ranges from less than 10 ft in the upland areas to up to 40 ft deep on the western and northern boundaries.

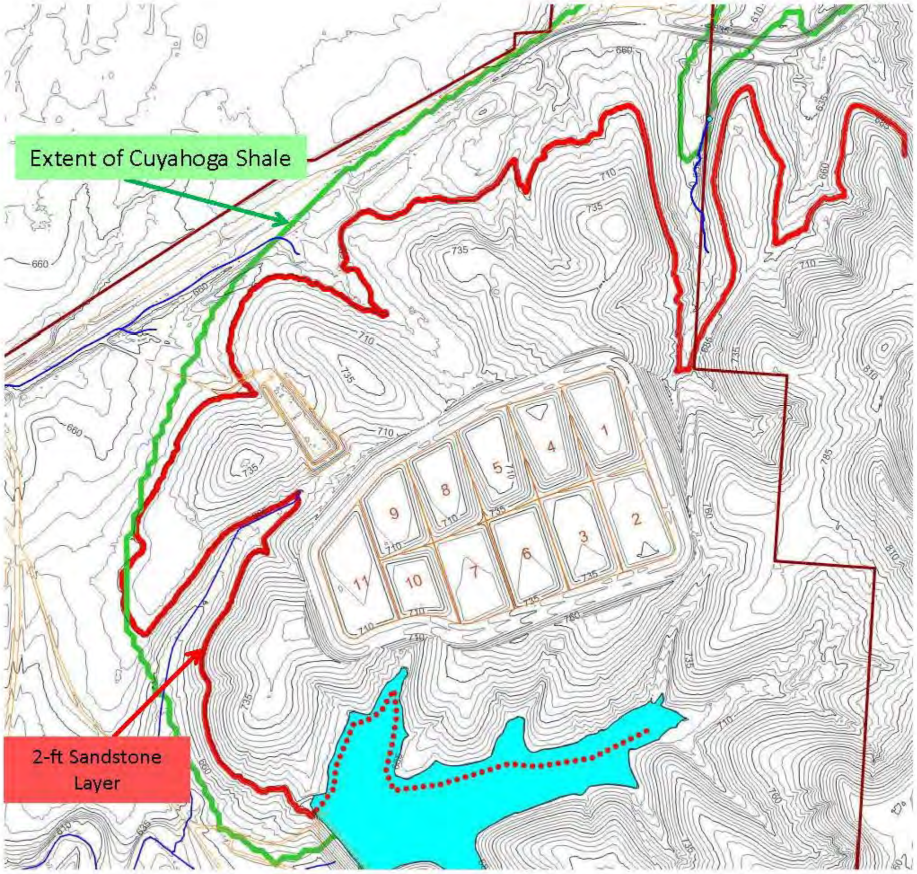

Figure I.7. Conceptual Location of a Potential OSDC at PORTS

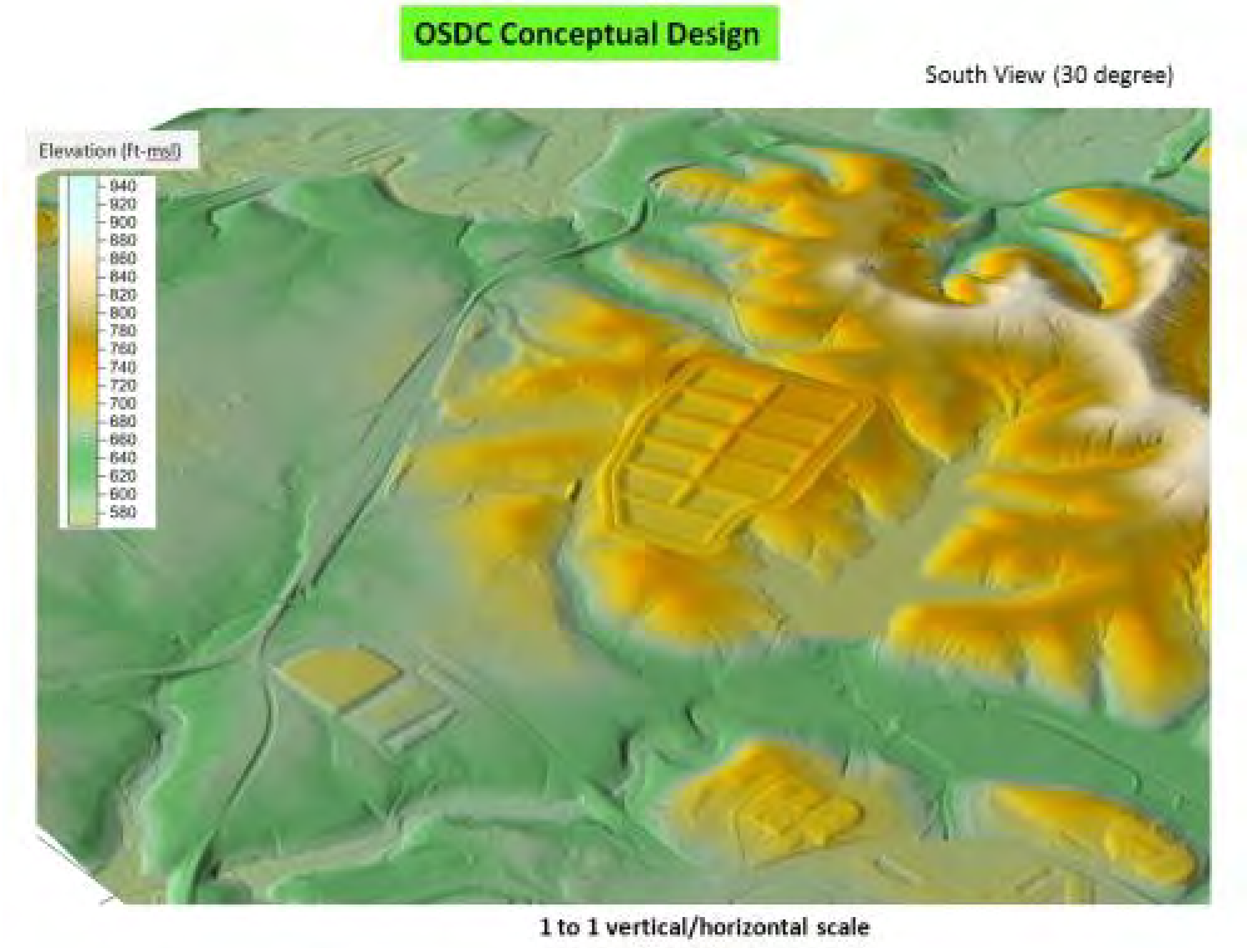

Figure I.8. Three-Dimensional Representation of OSDC Cells at PORTS

I.4.2 MULTILAYER BASE LINER SYSTEM

The purpose of this system is to prevent leachate from migrating out of the disposal unit. A compacted clay liner with a double geocomposite liner system is proposed, along with two low-permeability liners, a leachate collection and removal system, and a leak detection system. The primary liner would be constructed of a geomembrane to prevent migration of hazardous constituents into the secondary liner for the active life and post-operations care period. The secondary component of the composite bottom-liner would be designed and constructed using materials to minimize the migration of hazardous constituents if a breach in the primary liner were to occur. The active leachate collection system, which includes a drainage layer above the primary liner, would be designed, assembled, and installed to be fully functional for at least 30 years of post-operations, while the leak detection system between the primary and secondary layers would be capable of detecting leachate movement through the primary liner in excess of the action leakage rate. After the post-operations period ends, leachate would continue to be collected, although the amount generated is expected to be low. This leachate would be directed through the passive treatment system. The base liner proposed for the conceptual design includes the following layers from the cell base up:

- Compacted clay liner: A 3-ft-thick, low-permeability clay layer would be placed above the cut elevation (stable soil or bedrock) and have a hydraulic conductivity ≤ 1E-07 cm/s.

- Secondary liner: A geosynthetic clay liner (GCL) and flexible membrane liner (FML) would be installed. The FML would be a man-made geosynthetic barrier composed of materials compatible with the waste and resistant to degradation by the chemical constituents expected to be present in the leachate. A typical GCL consists of sodium bentonite encapsulated between two geotextiles. The GCL, which is less than 1 in. thick, typically has a hydraulic conductivity on the order of 5E-09 cm/s.

- Leak detection system drainage layer: This is a 1-ft gravel leak detection layer sandwiched between two geotextile layers on the cell floor. On the sloping (3 horizontal to 1 vertical) walls of the facility, geonet (a plastic grid sandwiched between two layers of geotextile with triple the flow capacity of gravel) would be used to transmit any leachate that penetrates the primary liner to the gravel leak detection system drainage layer on the cell base. This layer would be graded to drain toward detection piping. At each location where the leak detection piping penetrates a layer of the primary and secondary liner, an antiseep collar would be installed to prevent development of a preferential flow pathway. The detection piping would be connected to a separate detection sump in the leachate collection and transfer facility downgradient of the disposal cell. Little or no leachate is expected to be captured by this system during the operations or post-operations period.

- Primary liner: The primary liner would retard leachate migration out of the disposal cell and direct leachate into the primary leachate collection layer. The conceptual design includes an FML and a low-permeability GCL.

- Leachate collection system drainage layer: The primary leachate collection system drainage layer consists of a 1-ft-thick gravel layer on top of the primary liner on the cell floor and on the sloping walls. The leachate collection system drainage layer is sandwiched between two layers of geotextile on the cell floor and would collect significant volumes of leachate draining through the waste mass during operations and before placement of the cap. It would also collect small volumes of leachate during the post-operations period. The geotextile layers would cushion and protect the primary liner and retard infiltration of fines from the overlying soil and waste into the gravel, which would prolong the functional life of the leachate recovery system. Perforated leachate collection pipes would be placed in the gravel drainage layer and collect leachate in a central line that gravity flows out of the cell to a collection sump in the leachate collection and transfer facility. The primary leachate collection system would be designed with perforated collection piping and antiseep collars similar to those in the leak detection system drainage layer. On the sloping walls of the disposal cell, geonet (a plastic grid sandwiched between two layers of geotextile and with triple the flow capacity of gravel) would be used to transmit leachate to the gravel leachate collection system on the cell base. Man-made materials would be selected for compatibility with the expected leachate chemistry.

- 1-ft protective soil layer: A protective layer at least 1 ft thick would be placed over the upper leachate collection system geotextile to prevent damage to the underlying layers during operations.

Figure I.9 shows a typical cross section of a RCRA Subtitle C hazardous waste landfill liner system with the various layers that form a portion of the waste containment system.

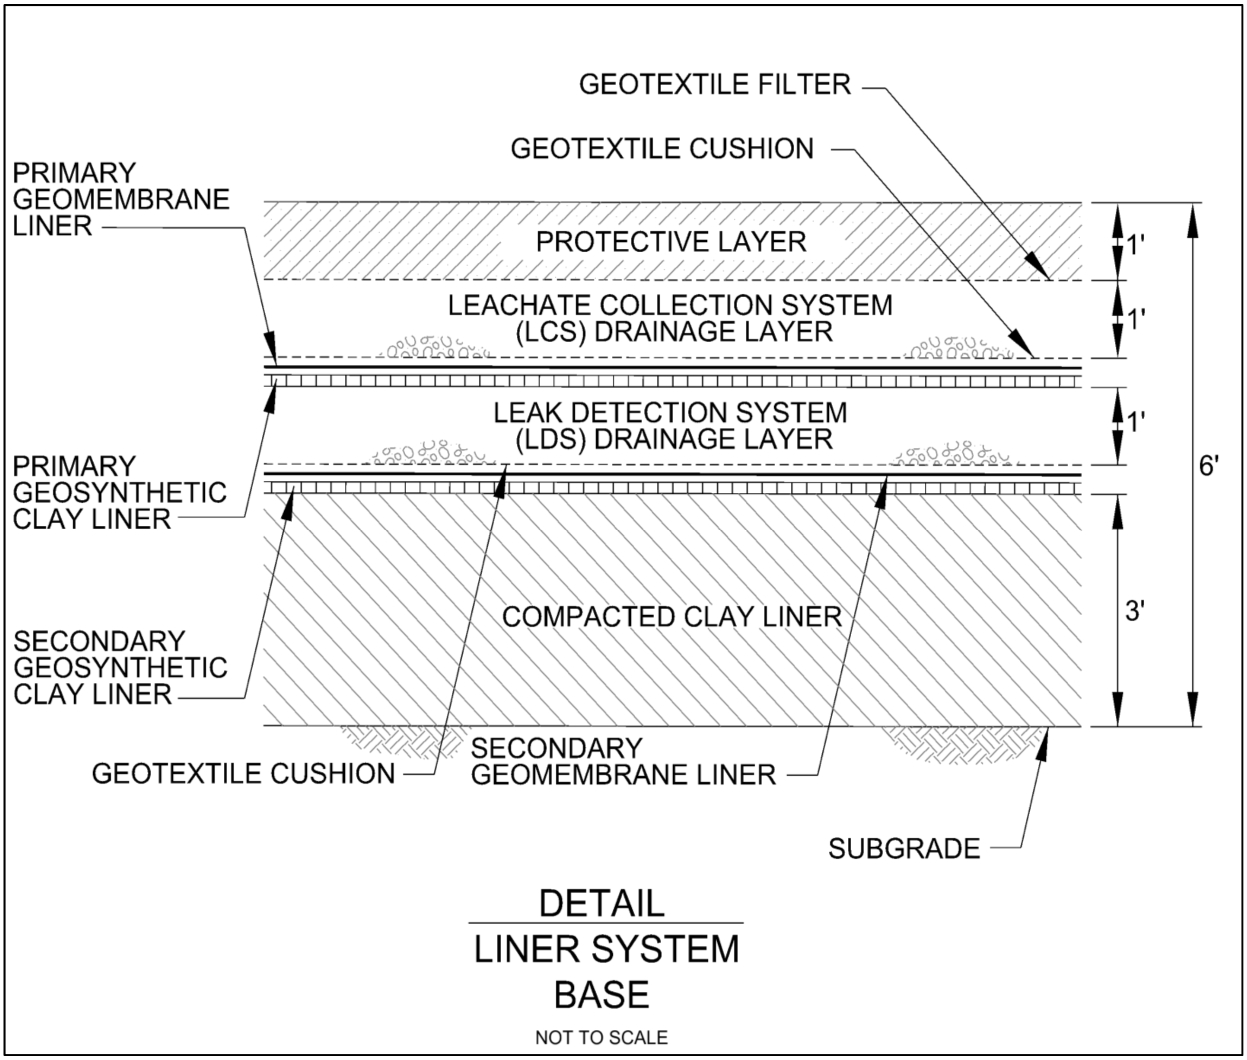

Figure I.9. Typical Section View – Landfill Base Liner System Details for a Potential OSDC at PORTS

I.4.3 COVER SYSTEM

The final cover would be designed and constructed for the following purposes:

- Minimize migration of liquids (precipitation) into the closed disposal cell over the long term
- Promote drainage and minimize erosion or abrasion of the cover
- Accommodate settling and subsidence to maintain the cover’s integrity
- Provide a permeability less than or equal to the permeability of any bottom-liner system or natural subsoils present

- Resist intrusion of humans, plants, and animals

- Minimize future maintenance.

The cover would be sloped to facilitate runoff and would be placed over the waste and into the perimeter of the disposal cells. The conceptual design for the nominal 10-ft-thick cover consists of the following elements from the top of the waste to the top of the cap:

- Soil contour layer: Following the placement of waste to final grade in any area, a soil contour layer would be placed over the waste to reduce infiltration and contain the waste before capping. The soil contour layer would include a 1-ft minimum clay contour soil layer to provide an intermediate uniform layer between the wastes and the final cover. This cover would bring the disposal cell to final grade in preparation for cover placement, reduce infiltration, and protect the permanent cover layer from settlement within the waste cell. With proper maintenance of the soil contour layer, this temporary cover would reduce infiltration sufficiently, pending installation of the other cap components.

- Secondary hydraulic barrier: during final capping, a 2-ft-thick, low-permeability clay layer would be placed above the soil contour layer. This layer is considered to be the secondary hydraulic barrier and would be similar in design to the low-permeability clay layer in the secondary base liner.

- Primary hydraulic barrier: A GCL and FML would be installed above the low-permeability soil layer. The GCL would serve as an additional low-permeability layer and would prevent infiltration. A thin layer of low-permeability clay would be placed above the GCL to prevent migration of the bentonite into the drainage layer in the event the geotextiles deteriorate.

- Drainage layer: Above the FML would be a 1-ft gravel drainage layer sandwiched between two layers of geotextile. The upper geotextile would minimize clogging of the drainage layer, and the lower geotextile would protect the FML from puncture.

- Biointrusion barrier: A 3-ft biointrusion barrier would prevent burrowing animals and plant root systems from penetrating the cover system and would also discourage inadvertent human intrusion by increasing the difficulty of digging or drilling into the cell. This layer would be constructed of cobbles (large, rounded stones) and is assumed to be a vertical percolation layer only to facilitate infiltration of water into the drainage layer, however some benefit to lateral drainage may be expected. A 6-in., graded natural filter (granular layer) would overlie the biointrusion layer to prevent clogging of the porous layer with overlying soil.

- Vegetative soil layer: A 2-ft vegetated soil layer over the filter layer (at a 2 to 2.5 percent grade on top of the cap) would provide conditions that support a vegetative cover to reduce erosion. A 6-in.-thick layer of topsoil would provide for permanent vegetation on top of the cap. To eliminate erosion until the permanent vegetation is established, an erosion mat would be installed to protect the other cover layers from the effects of wind and water erosion. It would accommodate the typical root systems of planted and native vegetation. This layer, the drainage layer, and the biointrusion layer together would be much thicker than the local frost depth, preventing frost damage to the FML and the low-permeability soil layer. Side slopes (6 ft horizontal to 1 ft vertical) of the cover system would be covered with a 2-ft soil/rock matrix and a 3-ft riprap layer to minimize erosion.

Figure I.10 shows a typical cross section of a RCRA Subtitle C hazardous waste landfill cap system with the various layers that form a portion of the waste containment system.

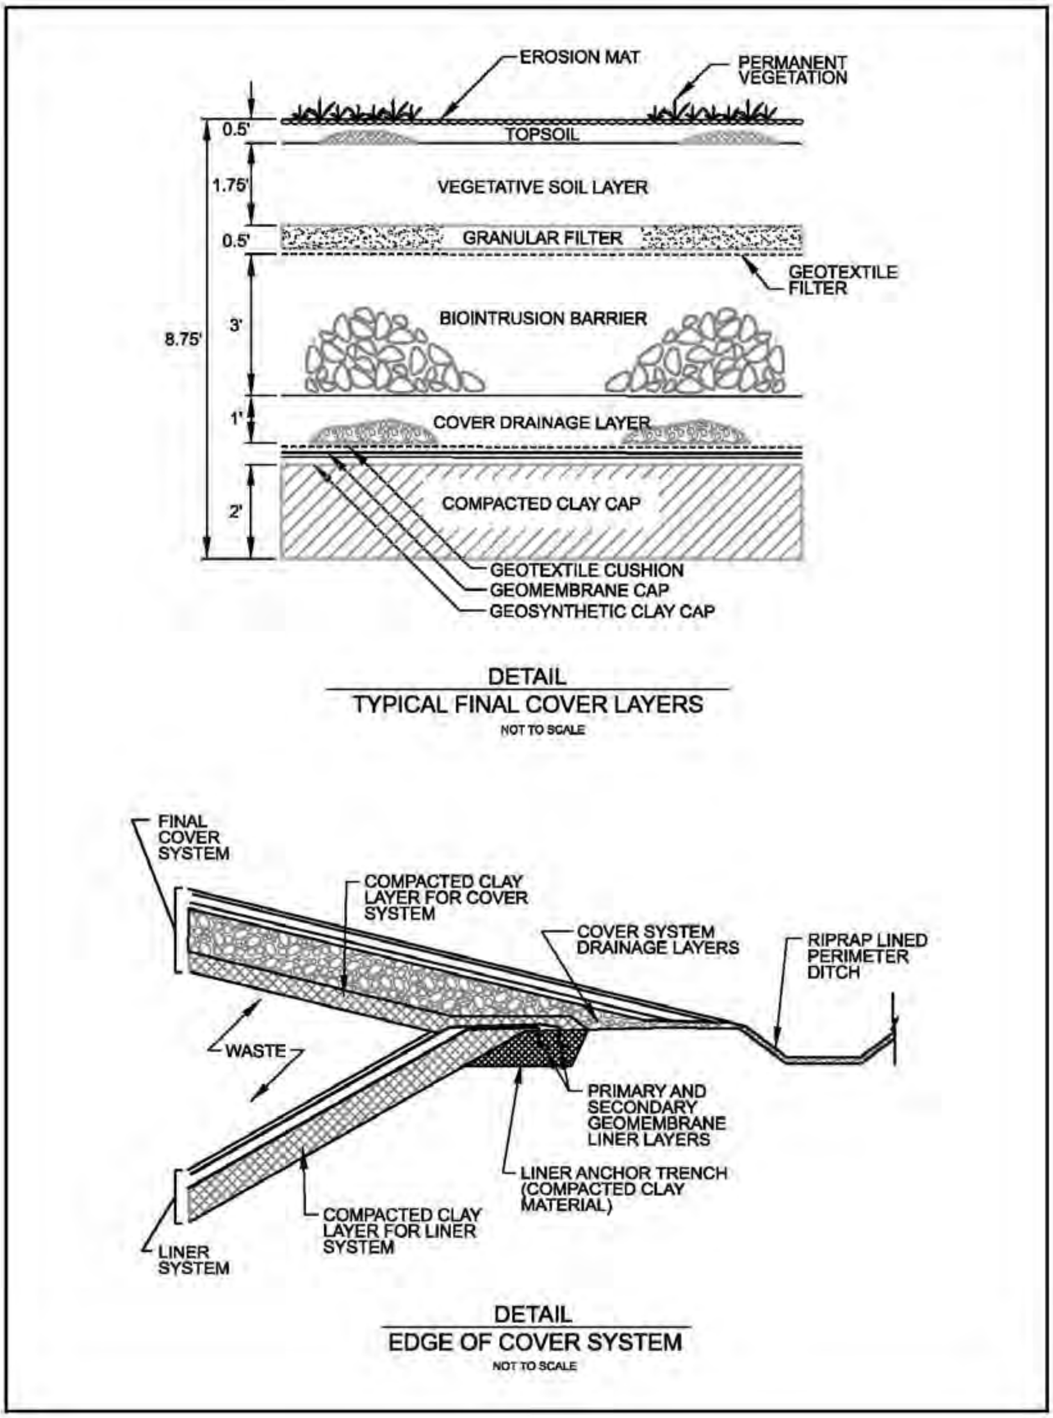

Figure I.10. Typical Section View – Landfill Final Cap Cover for a Potential OSDC at PORTS

The waste layer (averages approximately 50 ft thick) is assumed to consist primarily of contaminated soil and soil-like materials (EC-1), as well as scrap metal, cement-solidified waste, and other building waste (EC-2), based on analysis of the waste generation forecast presented in Section 4 of the RI/FS report. These wastes are assumed to be placed in vertical lifts sufficient to minimize void spaces within the waste layer. Specific OSDC waste loading and operational plans and procedures will be developed in post-Record of Decision documentation. For the purposes of draft modeled WAC development, the waste matrix is assumed to consist primarily of soil-like material (EC-1) since the waste (EC-2) is mixed with fill soil (EC-1) at a 2 to 1 ratio in order to meet waste compaction requirements.

The use of high-density polyethylene (HDPE) geomembrane liners in both the landfill cover and base liner systems (typically both a primary and secondary liner) are specifically prescribed by RCRA Subtitle C hazardous waste disposal regulations. Their purpose is primarily to retard the vertical migration of liquids (liners have extremely low hydraulic conductivity values), particularly when high volumes of leachate are expected, such as during operations, and secondarily to facilitate leachate collection and removal. Until very recently, there were little to no long-term performance metrics for HDPE liners. Landfill design and disposal experts have recently developed evidence, through empirical testing and research, that HDPE liners could perform their intended function for upwards of 500 to 1,000 years or more (Rowe et al. 2009). Currently, neither EPA nor the U.S. Nuclear Regulatory Commission (NRC) has developed regulations or guidance specific to assumptions regarding the expected longevity of HDPE liners. However, the NRC held a barriers workshop in August 2010 to gather information necessary to support development of future guidance. The document titled *Composite Barrier Longevity in Service at the Potential Portsmouth On-Site Disposal Cell* (Phifer and Denham 2012) indicates that the minimum service life of HDPE membranes in a potential OSDC would be on the order of 600 to 1,400 years. Nevertheless, for this draft modeled WAC evaluation, the DOE assumption is that no long-term credit is taken for the HDPE membranes in either the cap or liner systems after 200 years.

I.5. MODELED WASTE ACCEPTANCE CRITERIA

I.5.1 MODELING APPROACH AND MODELING CODES

This section provides descriptions of the computer models that were used to analyze fate and transport for a potential OSDC at Site D. To support the specific objectives of this analysis, existing and proven modeling tools, input parameters, and processes were used. The models selected are consistent with those described in the *Work Plan for Modeling Analysis in Support of Regulatory Decisions at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (DOE 2011b).

The Hydrologic Evaluation of Landfill Performance (HELP) model (Schroeder et al. 1994) was used to evaluate the water budget for a potential OSDC cell. The purpose of the model is to calculate the infiltration rates to groundwater through the varying layers of a potential OSDC, including the cover (or cap), waste layer, liner system, and unsaturated zone.

The HELP computer program is a quasi-two-dimensional hydrologic model of water movement across, into, through, and out of landfills. This model accepts weather, soil, and design data. It uses solution techniques that account for the effects of surface storage; snowmelt; runoff; infiltration; evapotranspiration; vegetative growth; soil moisture storage; lateral subsurface drainage; leachate recirculation; unsaturated vertical drainage; and leakage through soil, geomembrane, or composite liners. Landfill systems with various combinations of vegetation, cover soils, waste cells, lateral drain layers, low-permeability barrier clays and/or soils, and synthetic geomembrane liners may be modeled. The

HELP model was developed to assist landfill designers and regulators evaluate the hydrologic performance of proposed landfill designs. The program was designed to conduct water balance analyses for landfills, cover systems, and solid waste disposal and containment facilities. As such, the model facilitates rapid estimation of the amounts of runoff, evapotranspiration, drainage, leachate collection, and liner leakage that may be expected to result from operations involving a wide variety of landfill designs. The HELP model requires general climatic data, design parameters, and soil characteristics to perform the analysis. These are as follows:

- **Climatic data**. The needed general climatic data include growing season, average quarterly relative humidity, normal mean monthly temperatures and precipitation, maximum leaf area index, evaporative zone depth, and latitude. PORTS Facility meteorological data were used where available. Other parameters such as solar radiation and growing season were taken from the database provided in the HELP model, using the default values for the PORTS area.

- **Design parameters**. Potential OSDC design parameters include such items as the slope and maximum drainage distance for lateral drainage layers, layer thickness, layer description, area, leachate recirculation procedures, subsurface inflows, surface characteristics, and geomembrane characteristics.

- **Soil characteristics**. Necessary soil data include porosity, field capacity, wilting point, saturated hydraulic conductivity, initial moisture storage, and the U.S. Soil Conservation Service runoff curve number. The porosity, field capacity, wilting point, and saturated hydraulic conductivity are used to estimate the soil-water evaporation coefficient and Brooks-Corey soil moisture retention parameters. The HELP model contains default soil characteristics for 42 material types that are used when measurements or site-specific estimates are not available. Geotechnical parameters used in the model for each layer will also be based on final design criteria as information becomes available.

The HELP model simulations also calculate the soil moisture contents for the model layers. To determine the change in soil moisture content and calculate the steady-state soil moisture contents for the long-term scenario, multiple time periods are simulated. HELP Model (Version 3) (Schroeder et al. 1994), a readily available code in the public domain that was developed for EPA, is used to conduct the HELP model construction and simulations.

The Surface Transport Over Multiple Phases (STOMP) model (White and Oostrom 2000, 2006) was developed by Pacific Northwest National Laboratory for modeling subsurface flow and transport systems and remediation technologies. The fundamental purpose of the STOMP simulator is to produce numerical predictions of thermal and hydrogeologic flow and transport phenomena in variably saturated and fractured subsurface environments that are contaminated with radionuclides and volatile or nonvolatile organic compounds.

Quantitative predictions from the STOMP simulator are generated from the numerical solution of partial differential equations that describe subsurface environmental transport phenomena. Description of the contaminated subsurface environment is founded on governing conservation equations and constitutive functions. Governing coupled flow equations are partial differential equations for the conservation of water mass, air mass, carbon dioxide mass, methane mass, volatile organic compound (VOC) mass, salt mass, and thermal energy. Constitutive functions relate primary variables to secondary variables. Solution of the governing partial differential equations occurs by the integral volume finite difference method. The governing equations that describe thermal and hydrogeological flow processes are solved simultaneously using Newton Raphson iteration to resolve the nonlinearities in the governing equations.

Governing transport equations are partial differential equations for the conservation of solute mass. The governing equations for solute mass conservation are solved sequentially, following the solution of the coupled flow equations. This model has been applied at many DOE facilities.

MODFLOW (McDonald and Harbaugh 1988) and Modular Transport 3-Dimensional (MT3D) may be used to predict the impacts of a potential OSDC on regional groundwater zones and receptors away from the OSDC. The estimated parameters include groundwater flow path, travel time, velocity, flux rate, and concentration.

MODFLOW is a modular, block-centered, finite-difference groundwater flow code developed by the U.S. Geological Survey. It is capable of simulating both transient and steady-state saturated groundwater flow in one, two, or three dimensions. MODFLOW calculates potentiometric head distribution, flow rates, velocities, and water balances throughout an aquifer system. It also includes modules simulating recharge; flow towards wells; and groundwater flow into drains, streams, and rivers. A number of different boundary conditions are available, including specified head, areal recharge, injection or extraction wells, evapotranspiration, drains, streams, or rivers. Aquifers can be simulated as unconfined, confined, or a combination of unconfined and confined.

MODFLOW is used for the analysis because it is in the public domain; is widely used by the industrial, scientific, and governmental communities; has been rigorously tested and verified; and has a variety of software tools that are publicly available for graphical preprocessing and post-processing. In addition, MODFLOW has been used as the code for the PORTS-wide groundwater flow model.

The movement of contaminants in groundwater from the waste cell to points of exposure outside of the waste disposal site are simulated by using the MT3D model (Zheng 1990), a 3-D contaminant fate and transport model code.

MT3D is a comprehensive, 3-D numerical model for simulating solute transport in complex hydrogeologic settings. It is a numerical simulation code that models the fate and transport of dissolved, single-species contaminants in saturated groundwater systems. MT3D calculates concentration distributions, concentration histories at selected receptor points, hydraulic sinks (extraction wells), and the mass of contaminants in the groundwater system. The code can simulate 3-D transport in complex, steady-state, and transient flow fields. It can also represent anisotropic dispersion, source-sink mixing processes, first order transformation reactions, and linear and nonlinear sorption. MT3D offers the user a choice of four solution options, which makes it well suited for handling a wide range of conditions.

MT3D is linked with MODFLOW and is designed specifically to handle advectively dominated transport problems without the need to construct refined models specifically for solute transport. It is a popular 3-D solute transport code and has been used successfully to model hydrogeologic conditions at a variety of sites. MT3D is widely accepted by regulators and the groundwater consulting and research communities.

Because of the lithologic complexity of the potential OSDC site and the unique objectives of the models, links and interactions among the models are required. Potential OSDC design and performance assessment, involving many man-made and design features, are best evaluated with the HELP model. The output data, in terms of water flux to the underlying media, are used as the input parameters for the STOMP model, which is used to predict water and contaminant movement at the OSDC site in unsaturated, water-bearing, and small-area-scale groundwater zones. For the recognized regional groundwater zone beneath the OSDC, such as the Berea sandstone, the MODFLOW model is used.

Figure I.11 shows the model linking and relationships between them.

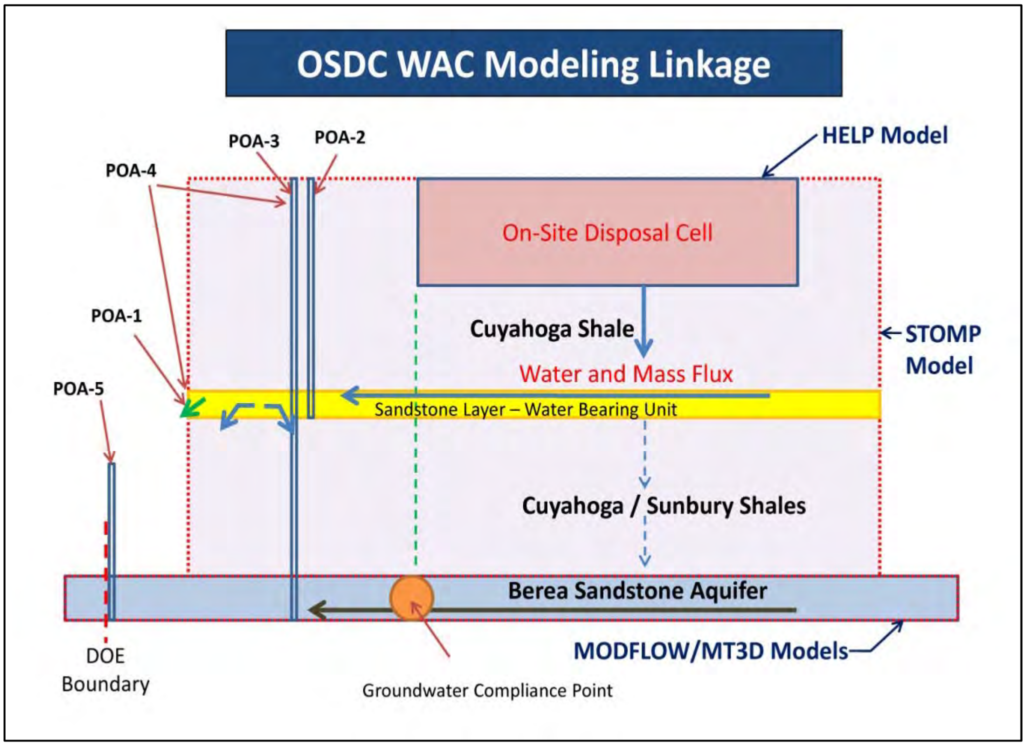

Figure I.11. Waste Acceptance Criteria Model Linkage and Application for PORTS

I.5.2 KEY ASSUMPTIONS AND SITE-SPECIFIC MODELS CONSTRUCTION

I.5.2.1 HELP Model

Climatic Parameters

The general climatic data include weather and evapotranspiration data. These data include growing season, average quarterly relative humidities, normal mean monthly temperatures and precipitation, maximum leaf area index, evaporative zone depth, and latitude. For detailed simulations, daily precipitation and temperature data are also required, either with area-specific data or simulated data based on short-period data for the maximum modeling period for each simulation (100 years).

Daily precipitation and temperature data have been recorded (starting in 1893) continuously at the nearby Waverly weather station, about 5 miles north of the plant. This station is currently operated by the National Oceanic and Atmospheric Administration. It is the most complete long-term weather data available in the area, including 117 years of data ranging from 1893 to 2011. Therefore, the daily data are used for the detailed HELP simulation. The data are also summarized to develop site-specific monthly averages of precipitation and temperature for the HELP model.

The evapotranspiration data for the Cincinnati area, such as solar radiation and growing season, from the database in the HELP model were used. The Cincinnati area has the same latitude (39 degrees) as PORTS.

Table I.6 summarizes the weather and evapotranspiration data used in the HELP model.

Table I.6. Summary of Evapotranspiration and Weather Data in HELP Model

Station Latitude = 39.10 degrees
Maximum Leaf Area Index = 2.00
Start Of Growing Season (Julian Date) = 104
End Of Growing Season (Julian Date) = 295
Evaporative Zone Depth = 21.0 in.
Average Annual Wind Speed = 9.10 mph
Average 1st Quarter Relative Humidity = 70.00%
Average 2nd Quarter Relative Humidity = 67.00%
Average 3rd Quarter Relative Humidity = 73.00%
Average 4th Quarter Relative Humidity = 72.00%

Normal Mean Monthly Precipitation (in.)

January/July	February/August	March/September	April/October	May/November	June/December
3.23	2.63	3.83	3.54	4.12	3.82
4.21	3.82	2.76	2.45	2.76	2.99

Normal Mean Monthly Temperature (ºF)

January/July	February/August	March/September	April/October	May/November	June/December
31.30	33.20	43.00	53.00	62.80	71.30
74.80	73.40	67.00	55.20	43.90	34.00

Design Parameters and Material Characteristics

Design specifications for a potential OSDC at Site D include such items as the slope and maximum drainage distance for lateral drainage layers, layer thickness, layer description, area, leachate recirculation procedures, subsurface inflows, surface characteristics, and geomembrane characteristics.

Necessary data on the soil material include porosity, field capacity, wilting point, saturated hydraulic conductivity, initial moisture storage, and Soil Conservation Service runoff curve number. The porosity, field capacity, wilting point, and saturated hydraulic conductivity are used to estimate the soil-water evaporation coefficients and Brooks-Corey soil moisture retention parameters. The HELP model contains default soil characteristics for 42 material types. They are used when site-specific measurements or estimates are not available.

The proposed engineering design for the disposal cells is used for the design specification, as shown in Section I.4. The geotechnical parameters used in the model for each layer are also based on design criteria. The soil, waste, and geosynthetic material characteristics used in the HELP model are presented in Table I.7.

Table I.7. Design Profile and Soil Characteristics

Layer Number	Material	Layer Type[a]	Layer Thickness (in.)	Soil Texture[b] Type	Total Porosity (vol/vol)	Field Capacity (vol/vol)	Wilting Point (vol/vol)	Sat. Hyd. Conductivity (cm/sec)	Drainage Length (ft)	Drain Slope (%)

[a] Layer type:
1 - vertical percolation
2 - lateral drainage
3 - barrier soil liner
4 - geomembrane liner

[b] Soil texture type and its characteristics are defined in HELP (Schroeder et. al. 1994)

HDPE = high-density polyethylene
FML = flexible membrane liner
GCL = geosynthetic clay liner

HELP Model Simulation and Results

Because of the long time period considered in the modeled WAC analysis, the designed cell cover and liner system performance will change over time. To account for changes to the material characteristics, the following four scenarios are considered for disposal cell performance:

- Complete design performance – All layers are functional and simulated. It is the design scenario for the duration of the cell operation and the initial full maintenance period. Every aspect of the system is expected to perform as designed, including all engineering-design features such as the HDPE, leachate collection system, and drainage layers.

- Partial design performance – Geomembrane liner layers, consisting of HDPE, are assumed to be totally ineffective after 200 years post-operations. Because there is uncertainty regarding the longevity of the HDPE layers, which have the extremely low permeability of 2E-13 cm/s, it is assumed that the geomembrane liners will no longer function as impermeable layers in the cover and liner systems.

- Long period performance – All engineered GCL layers are assumed to be totally ineffective. The drainage layers in the liner systems are assumed to be ineffective as well, and the drainage layers in the liner system become vertical percolation layers. No water will flow out from these drainage layers of the liner system. The rest of the natural soil materials will maintain their properties.

Figure I.12 shows the general long-term performance of the disposal cell layers and associated modeling assumptions. For the OSDC WAC modeling only, it is assumed that DOE would operate and cap a potential OSDC within an approximate 20-year period. Generally, all engineered systems are assumed to remain fully functional for at least 200 years, with loss in functionality of certain portions of the system after this time frame.

Based on the OSDC design criteria, literature research, applications at other DOE sites, and discussions with Ohio EPA, it is determined that the following performance periods are to be applied for HELP and draft WAC modeling:

- 0-200 years - Complete design performance
- 200-500 years - Partial design performance
- 500-1,000 years - Long-term performance.

Conservative assumptions (those which are lower than expected values) were applied for many of these performance periods resulting in higher modeled contaminant migration rates. For example, various cited references have documented that the HDPE geomembrane liner will last for a period of over 600 years under the typical physiochemical conditions in the landfill system. However, only a 200-year credit is considered for the geomembrane liners. The hydraulic property for the GCL layer in the liner system is also considered to be degraded from 3.0E-09 to 5.0E-08 because of very conservative potential chemical reaction considerations during the partial design performance period. The extremely long period assumed for the cover/liner clays indicates that they will degrade from their initial hydraulic properties to the site-specific Minford clay properties. However, the liner clay layers will be under much greater depth than the Minford clay. Therefore, it is likely that they will remain saturated, which makes the degradation highly unlikely.

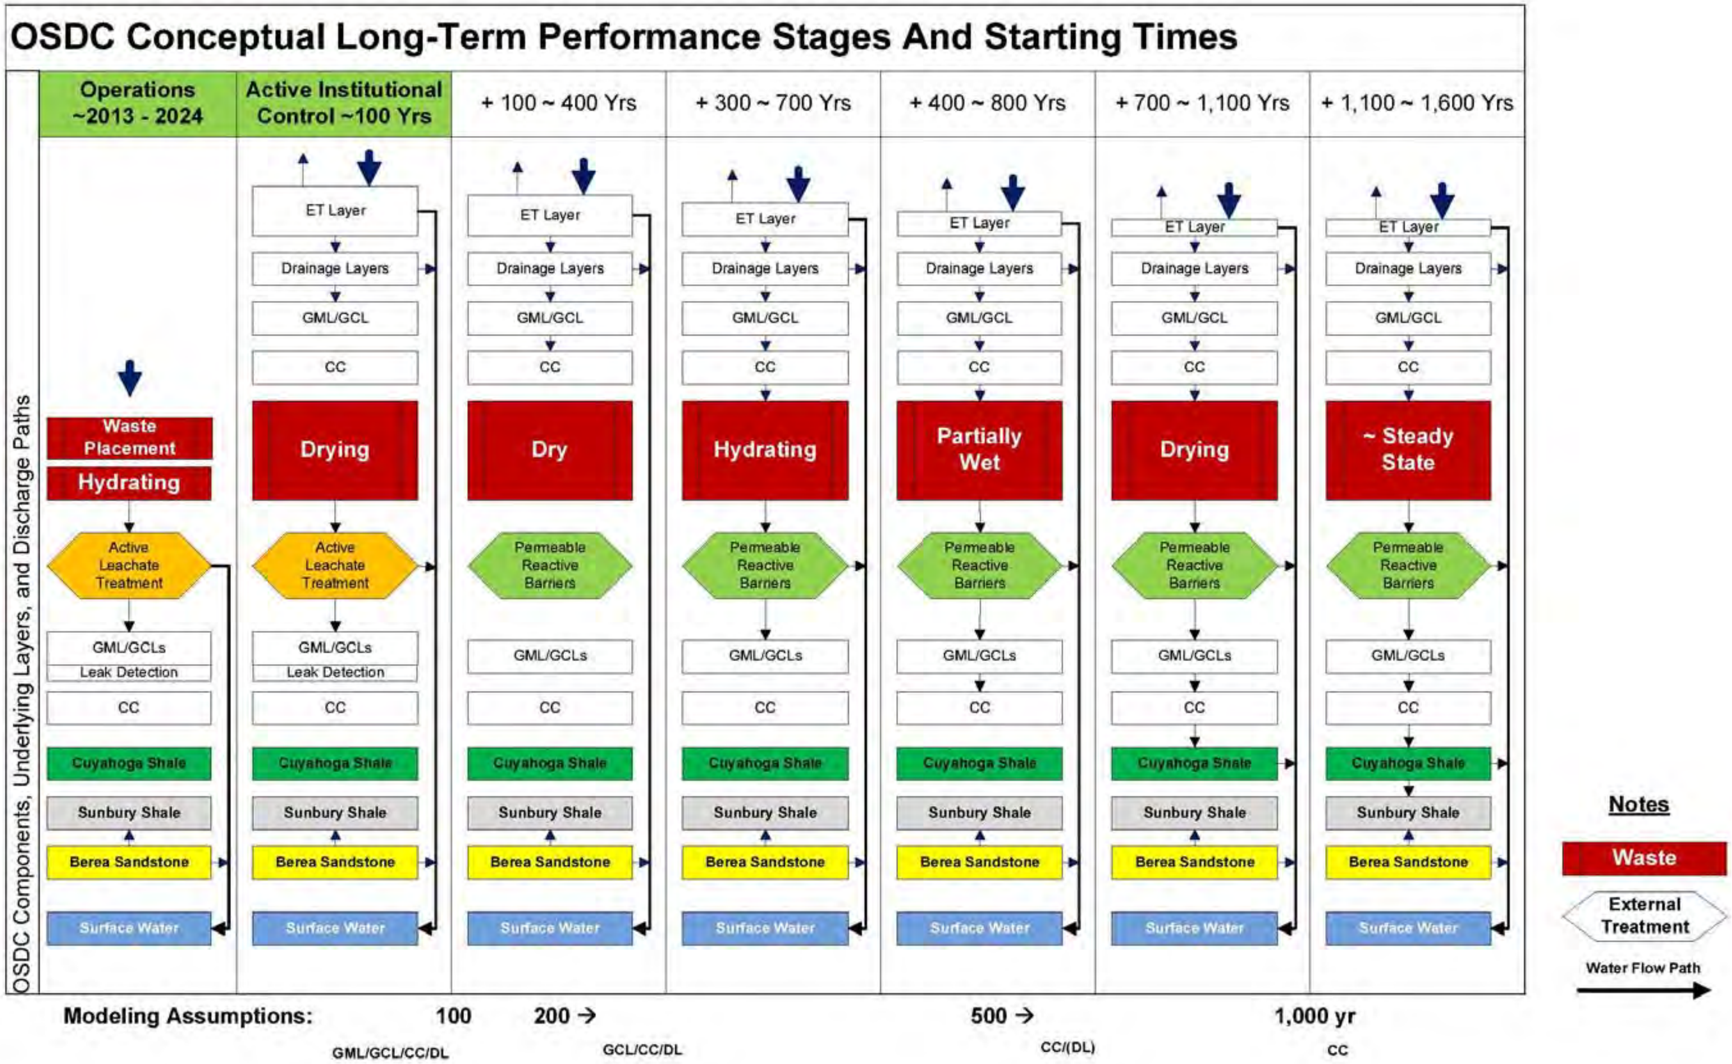

Figure I.12. OSDC Conceptual Long-term Performance at PORTS

HELP model simulations were conducted for each performance period discussed above. Table I.8 summarizes the modeling layer assumptions for the four performance periods and presents the HELP model results.

Table I.8. HELP Model Predicted Mass Balance and Infiltration Rates for Various Performance Periods

Cell Layer System		**Period (Years after Cell Capping)**	**Year 0-200**		**Year 201-500**		**Year 501-1,000**

		Flux Rate through Clay Liner (in./yr)	**0.00**	0	**0.05**	0.14	**1.08**	3.84

FML = flexible membrane liner
GCL = geosynthetic clay liner

As shown in Table I.8, no infiltration is expected through the bottom of the liner clay layer and into the underlying Cuyahoga shale for the first 200 years. Additionally, almost no water will enter the waste through the designed cover system for this period (flux of 1E-05 in./yr).

Between 200 and 500 years, a very minimum flux of water is predicted. It enters the waste and is collected by the drainage layer in the liner system. The water flux rate is estimated to be 0.05 in./yr. Between 500 and 1,000 years, the predicted infiltration rate is predicted to increase to 1.08 in./yr. It is noted that the two infiltration rates predicted by the HELP model are higher than the likely natural infiltration rate through the shale formation, based on current investigation and STOMP model simulation of the current conditions. Therefore, applying the higher infiltration rates from the HELP model to the WAC models likely results in higher mass flux to the underlying unit, thereby making the WAC model more conservative.

Various scenarios of cover degradation over time with potential erosion to the biointrusion layer are also simulated with the HELP model. These sensitivity runs provided slightly more variable infiltration rates through the disposal cell, but the results did not change greatly from the base case. Thus, the base case results are used as inputs for the STOMP model.

I.5.2.2 STOMP Model

STOMP Model Construction

A 3-D STOMP model has been developed for the potential OSDC area at Site D. The model domain is selected on the basis of OSDC design, lithological unit distribution, and potential risk receptors. The conceptual OSDC will sit on top of the Cuyahoga shale, which is underlain by Sunbury shale and Berea sandstone. The Berea sandstone is mostly saturated in the area and is considered to be a groundwater aquifer unit. The Berea sandstone is underlain by Bedford shale, a thick shale unit considered to be an aquitard for the area.

During the preliminary investigation, a continuous 2-ft sandstone layer (680-ft sandstone), occurring in the middle of the Cuyahoga shale, was identified as the potential water bearing unit and migration pathway for the contaminants released from the potential OSDC. Therefore, the STOMP model domain is set to include all the potential discharge locations and exposure points associated with the sandstone layer. Figure I.13 shows the model domain used for the 3-D STOMP model.

Construction of the model requires a detailed 3-D representation of the various rock/soil zonations and definition of the boundary conditions. The following data are used to construct the 3-D model:

- Topography
- Lithology
- Cell design.

Based on the site-specific investigation, as discussed in Section 2 of the waste disposition RI/FS report, a detailed 3-D lithologic mapping analysis was conducted during STOMP model development. The distribution of all the stratigraphic units (rock/soil type) is defined in the X, Y, and Z directions. The stratigraphic units include weathered residuum, weathered shale, upper Cuyahoga shale (above the 680-ft sandstone layer), 680-ft sandstone layer, Cuyahoga shale, Sunbury shale, and Berea sandstone. The 680-ft sandstone unit consists of a continuous 2-ft layer and a 6-in. layer separated by a 2-ft shale. Therefore, the unit is represented as a 5-ft-thick layer in the model.

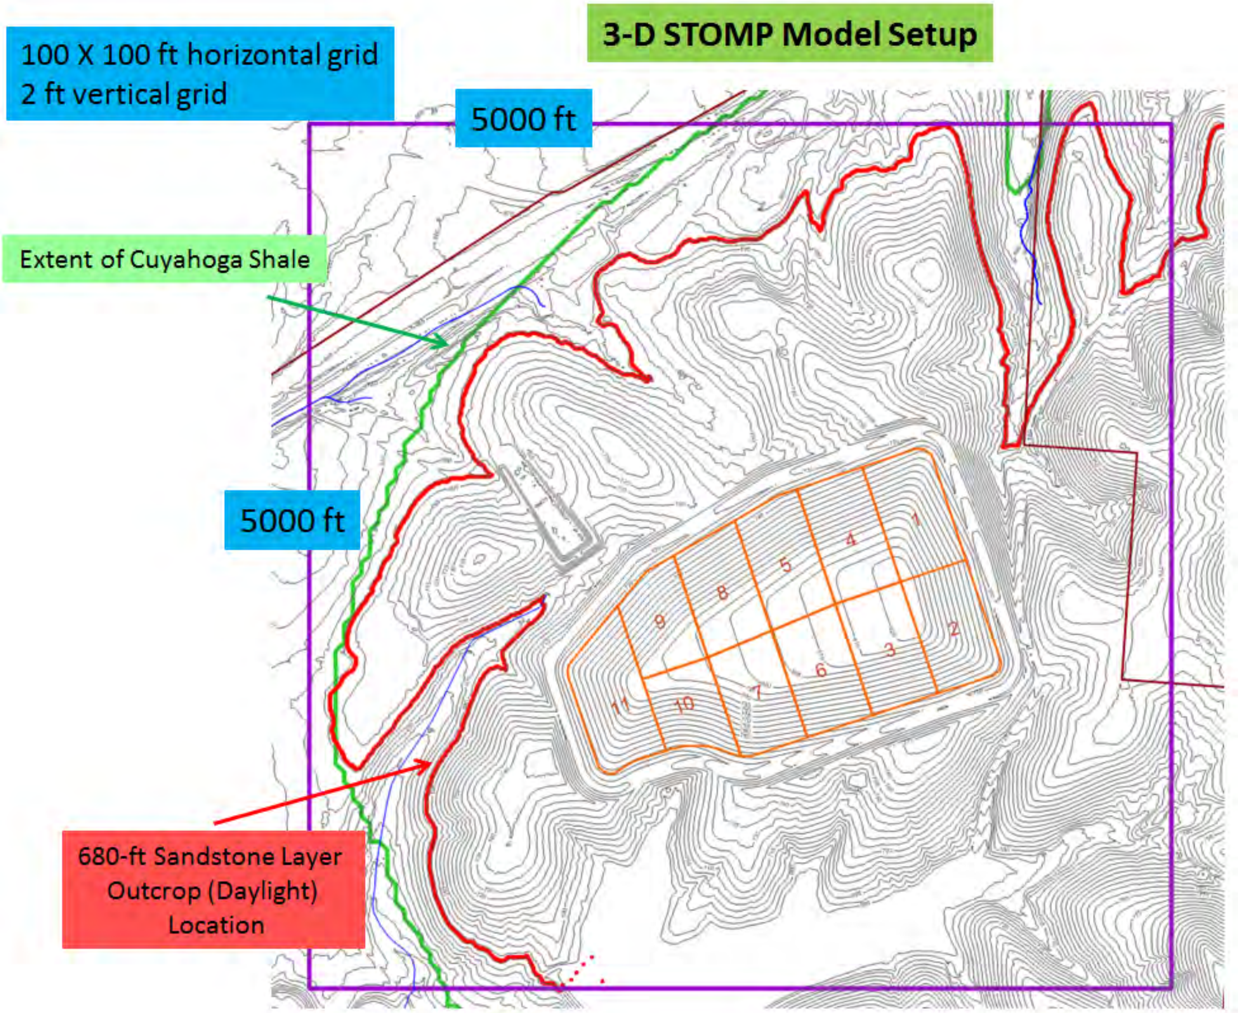

Figure I.13. STOMP Model Domain and Representation for Site D at PORTS

Conceptual design data, previously discussed, are used to define the cover, waste, and liner system. The design data are combined with the current site-specific lithologic data to generate the future stratigraphic distribution of the potential OSDC site. Figure I.14 shows the 3-D distribution of the key layers within the Study Area D model domain.

A horizontally uniform grid system is used to construct the 3-D STOMP model for simplification of model calculation. A grid space of 100 ft is used in both the X and Y directions. Inactive cells are assigned where shale is absent or the area is hydraulically disconnected from the potential OSDC area.

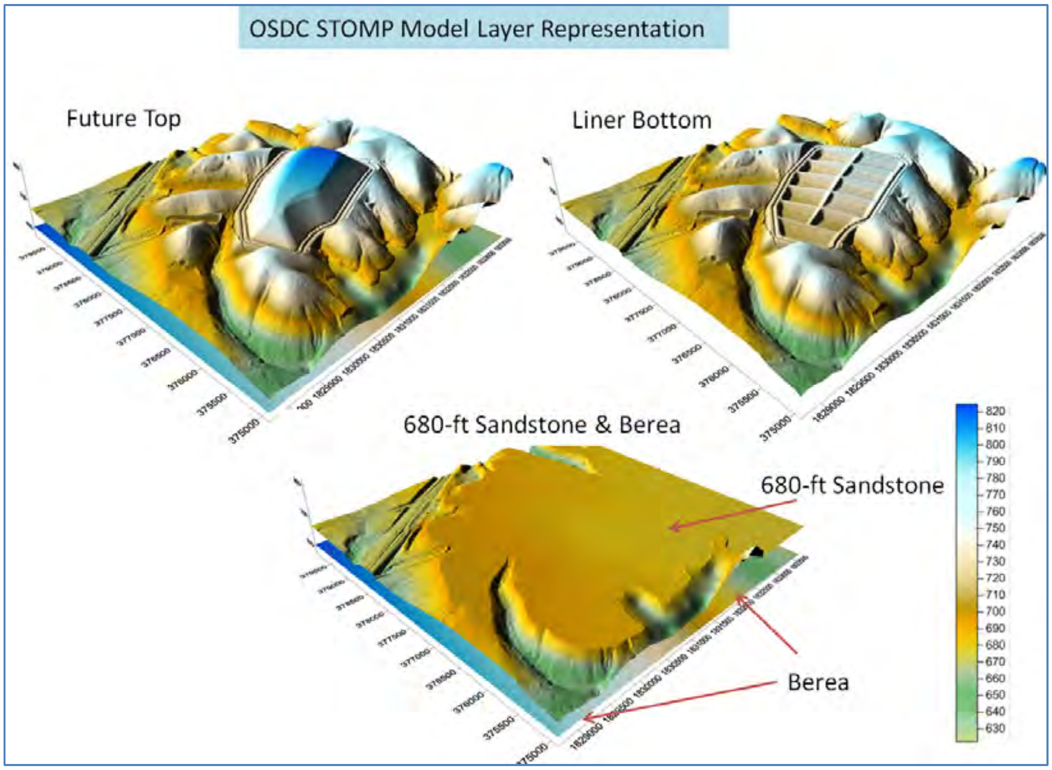

Figure I.14. Three-Dimensional Representation of Key Layers within the Model Domain

Figure I.15 shows a grid setup in the horizontal directions. Fifty cells are used in both the X and Y directions.

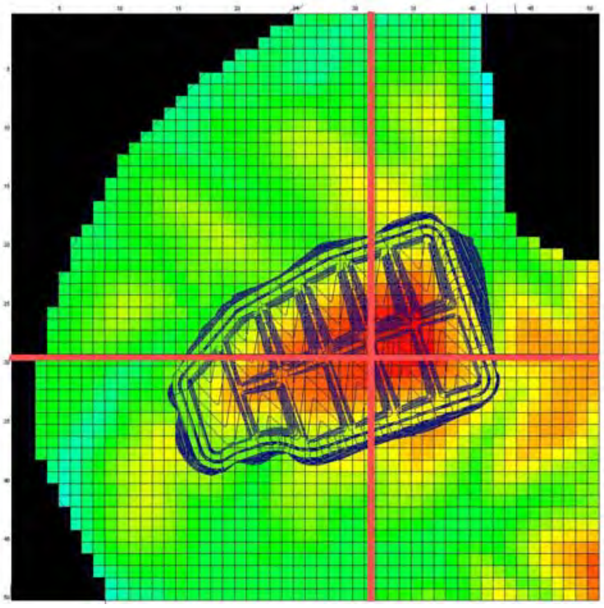

Figure I.15. STOMP Model Grid Setup for Site D at PORTS

A more refined and uniform 2-ft grid space is used to represent the lithologic variation in the vertical direction. The refined grid space in vertical direction allows the model to represent the lithologic variation more precisely and to predict movement of the contaminants in the unsaturated zone beneath the cell because of the unique features of Study Area D. There are 124 layers in the model.

The topography from the conceptual cell design for the affected area and the existing topography outside of the cells are used to establish the top of the active model layer where the top of the Bedford shale is assumed to be the bottom of the active model cells. A free-air flow boundary condition is assigned for all the top nodes of the model layer and all boundary nodes where an unsaturated condition is present. Depending on the water-air pressure relationship, the defined node boundary condition allows the water to get out of the model domain (discharge) if the water pressure is greater than the atmospheric pressure.

The 3-D distribution of the rock/soil types is then represented in the STOMP model. Figures I.16 and I.17 show the vertical representations of the lithologies in the west-east and south-north directions across the potential OSDC footprint. As discussed earlier, the future condition for the X-611B Sludge Pond includes the assumption that the sandstone layer at the northern slope of the pond will be exposed and the assumption that the pond will be drained below the elevation of the sandstone layer; therefore, the current hydraulic head at the X-611B Sludge Pond was not included in the model.

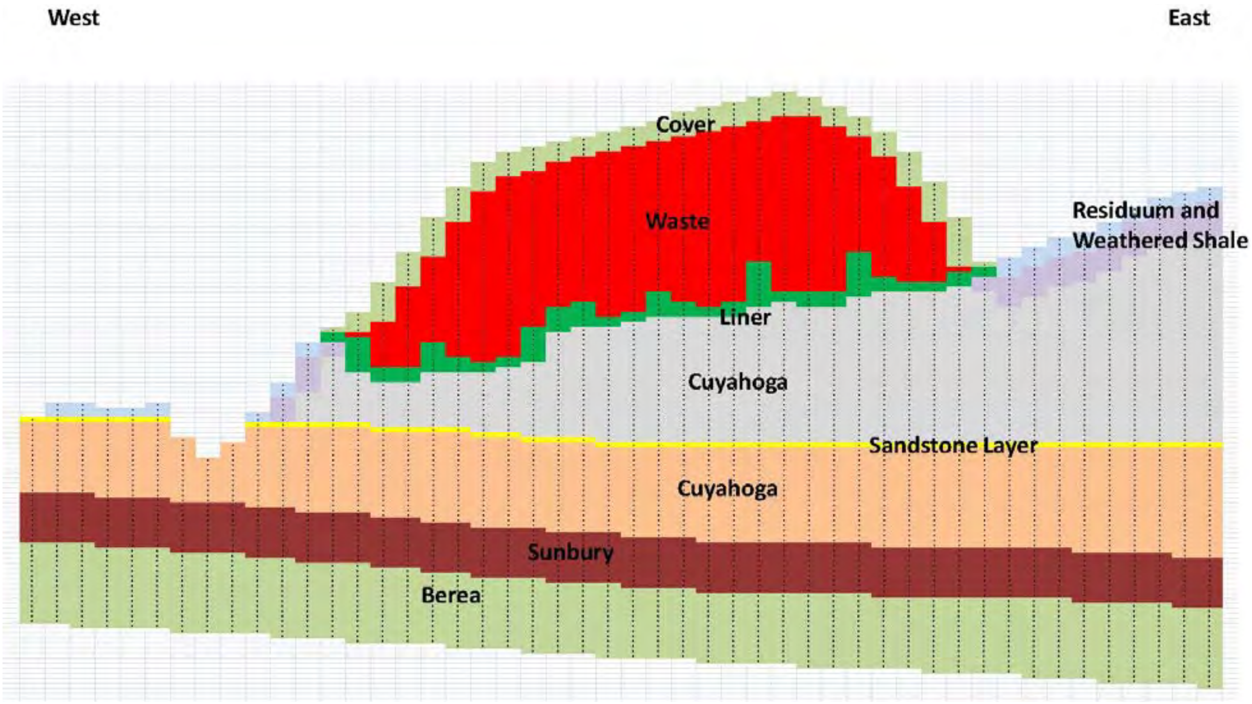

Figure I.16. Vertical Presentation (West-East) in the STOMP Model for Site D at PORTS

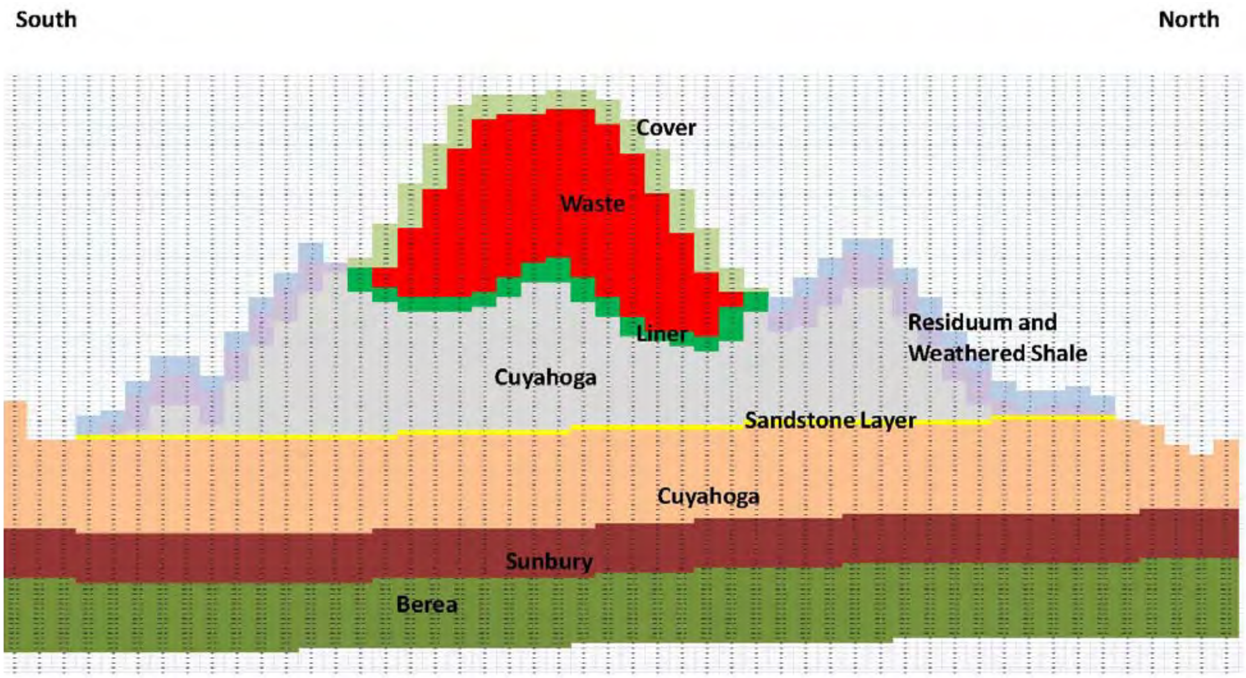

Figure I.17. Vertical Presentation (South-North) in the STOMP Model for Site D at PORTS

Table I.9 summarizes the model construction parameters and the media types represented in the model. Ten rock/soil types are used in the STOMP model.

Table I.9. STOMP Model Summary

Model Grid	Number of Model Columns (along the X Direction)	50
	Number of Model Rows (along the Y Direction)	50
	Number of Model Layers (along the Z Direction)	124
	Number of Model Nodes	310,000

	Rock/Soil Types Modeled	Cell Cover Waste Liner-Clay Residuum Soil Weathered-Shale Upper Cuyahoga-Shale Sandstone-Layer Cuyahoga-Shale Sunbury-Shale Berea-Sandstone

STOMP Model Input Parameters

The input parameter categories required to conduct a STOMP simulation include media, mechanical, and hydraulic properties; saturation function; aqueous relative permeability; solute-fluid interaction; and solute-porous media interaction. These include the following:

- Mechanical properties such as particle density, porosity (total and effective), specific storativity, compressibility, and tortuosity function for each defined rock/soil type
- Hydraulic properties such as intrinsic permeability or hydraulic conductivities in the 3-D directions for each defined rock/soil type
- Saturation function, which defines a saturation-capillary pressure function for each defined rock/soil type
- Aqueous relative permeability, which defines a relative permeability-saturation function for the aqueous phase for each defined rock/soil type
- Solute-fluid interaction, which defines solutes, solute-fluid interactions, and solute radioactive decay path parameters, including diffusion coefficients, radioactive decay rate, and half-life
- Solute-porous media interaction, which defines solid-aqueous phase partition coefficients (K_d) and porous-media-dependent hydraulic dispersivities. The solute-porous parameters are dependent on both the solute and rock/soil type.

All of the input parameters used to conduct the STOMP model are based on investigation data collected at Site D. The investigation, as discussed in Section 2 of the waste disposition RI/FS report, includes the following:

- Lithologic borings
- Water levels and aquifer pump tests
- Geotechnical data
    - Porosity
    - Moisture content
    - Grain size distribution
    - Specific gravity
    - Permeability
    - Hydraulic conductivity.
- Geochemical parameters.
    - Total organic carbon
    - K_d.

The mechanical properties of the conceptual OSDC components, such as cover and liner materials, are based on typical design criteria and the HELP model database. Tables I.10 and I.11 summarize the physical and hydraulic parameters used in the STOMP model for the rock/soil types. The aquifer tests conducted in the 680-ft sandstone identified two hydraulic conductivity zones for the unit. Most of Site D has relatively lower yield; however, this appears to have a higher K zone in the southern part of Site D around PZ-09C and PZ-12C. The southern area near WD-PZ09C and WD-PZ12C appears to be influenced by interconnected fractures and bedding plane partings within the 680-ft sandstone that allow greater transmissivity. Therefore, various hydraulic conductivity values were used during model simulation and sensitivity analysis for the modeled WAC development.

Table I.10. Summary of Soil/Rock Physical Properties in Site D at PORTS

Rock/Soil Types	Particle Density (kg/m^3)	Porosity	Effective (Diffusive) Porosity[1]
Cover	2,650	0.4	0.4
Waste	2,650	0.419	0.419
Liner-Clay	2,650	0.427	0.427
Regolith	2,650	0.4	0.4
Weathered-Shale	2,650	0.25	0.25
Upper Cuyahoga-Shale	2,650	0.16	0.16
Sandstone-Layer	2,650	0.18	0.18
Cuyahoga-Shale	2,650	0.14	0.14
Sunbury-Shale	2,650	0.13	0.13
Berea-Sandstone	2,650	0.21	0.21

[1] For this analysis, effective porosity is assumed to be equivalent to porosity.

Table I.11. Summary of Soil/Rock Hydraulic Conductivities in Site D at PORTS

Rock/Soil Types	K(x) (cm/s)	K(y) (cm/s)	K(z) (cm/s)
Cover	1.00E-05	1.00 E-05	1.00 E-05
Waste	1.00E-04	1.00 E-04	1.00 E-04
Liner-Clay	1.00E-07	1.00 E-07	1.00 E-07
Regolith	5.00E-04	5.00 E-04	1.00 E-04
Weathered-Shale	1.00E-05	1.00 E-05	1.00 E-06
Upper Cuyahoga-Shale	3.20E-06	3.20 E-06	3.20 E-07
Sandstone-Layer	1.00E-04 – 1.40E-02	1.00E-04 – 1.40E-02	1.00 E-05
Cuyahoga-Shale	1.30E-08	1.30 E-08	1.30 E-09
Sunbury-Shale	4.40E-08	4.40 E-08	4.40 E-09
Berea-Sandstone	1.90E-04	1.90 E-04	3.80 E-05

K = hydraulic conductivity

The solute-fluid and solute-porous media interaction parameters are needed to conduct the fate and transport analysis for all the constituents. These parameters are obtained from various sources (in addition to site-specific data). Partition coefficients (K_d values) for technetium-99 and uranium have been obtained from analysis of all the rock/soil types at PORTS, as well as from specific waste items to provide waste-matrix K_d values. For other radionuclide and nonradionuclide constituents, a comprehensive compilation of the K_d values was conducted from DOE and EPA documents (DOE 1995b, EPA 1999a, 1999b, 2004; Yu et al. 2001) and WAC studies conducted for other DOE sites such as Fernald (DOE 1996f) and Oak Ridge (DOE 1998c), and Utah Class A Disposal Cell (Whetstone Associates 2011). Based on the compilation, K_d values in the waste for other radionuclides were selected. To reflect the K_d variation in various rock/soil types, the same relationship observed from site-specific uranium K_d values measured in natural media was applied for these radionuclides. Table I.12 lists the K_d

values applied in the STOMP model for the radionuclides in each rock/soil type. The table also lists the half-life and specific activity of each radionuclide.

Compilation of K_d values for inorganic constituents was also conducted by using various sources (EPA 1996, EPA 1999a, EPA 1999b, EPA 2004, EPA 2005, DOE 2009a, DOE 2009b). Based on the data comparison, the K_d values presented in the latest DOE RAIS database (DOE 2012) were used for most of the COC waste source zone K_d values. Compared with the EPA data range, the RAIS data have generally lower K_d values (more mobile); therefore, model results tend to be more conservative. To reflect the K_d variation in various rock/soil types, the same relationship observed from site-specific uranium K_d values among native media was applied for these inorganic constituents. The K_d values for the soil/rock types used in the STOMP model for inorganic constituents are shown in Table I.13.

The chemical-specific parameters for organic constituents, including the octanol-water partition coefficient (K_{OC}), diffusivity in water, and solubility are obtained from the DOE RAIS database (DOE 2012) and the Agency for Toxic Substances and Disease Registry (ATSDR) database (ATSDR 2012). Using the site-specific total organic carbon values for various media and the K_{OC} values, K_d values for the organic constituents were calculated. Table I.14 lists these values.

Most of the organic compounds, especially VOCs and semivolatile organic compounds (SVOCs), undergo biodegradation under typical environmental conditions. The half-life, which represents the time for one-half of the mass of the compound to degrade and be lost, varies greatly as reported in the literature and depends on environmental conditions and the contaminated media. Extensive literature research was conducted to compile all available organic COC half-life values; California Environmental Protection Agency [California EPA] 2000; and World Health Organization [WHO] 2004). The higher values for half-life for the organic COCs from these sources were used and are listed in Table I.14.

Table I.12. K_d Values and Half-life of Radionuclides Used in the STOMP Model

	K_d (mL/g)[1]

[1] PORTS site-specific K_d sample data; geometric means presented for Tc-99, U-234, U-235, U-236, and U-238. For other radionuclide COCs, K_d values for waste are from literature values and for other media K_d values are derived based on site-specific uranium K_d relationship.

[2] Descrepencies in the K_d results for the geologic units are due to differing geochemical conditions within the units which alter the sorption affinity of both Tc-99 and uranium.

COC = contaminant of concern
PORTS = Portsmouth Gaseous Diffusion Plant

Water diffusivity, K_{OC}, and solubility data are from DOE 2012.

[1] K_d values derived based on geometric means of site-specific organic carbon content for the media. The following F_{oc} values are used: Waste/Liner Clay - 0.00204; Residuum/Weathered Shale - 0.00502; Cuyahoga Shale - 0.00701; Sunbury Shale - 0.0833; and Sandstone Layer/Berea Sandstone - 0.00357.
[2] For short half-life COCs, 1 year half-life was assumed.

COC = contaminant of concern
DOE = U.S. Department of Energy

STOMP Model Simulations

Using the parameters discussed above, the STOMP model simulations are conducted in both water-only and coupled-water fate and transport analysis. For water-only simulations, the movement of the water is predicted as the travel time and flux to the underlying sandstone layer and ultimately to the potential receptor locations, as well as to the Berea sandstone, and is presented as saturation profiles over time.

The following water infiltration rates predicted by the HELP model are used as the top boundary flux rates within the OSDC footprint over the modeled WAC time period (1,000 years) with the following time frames and assumptions considered:

- 0-200 years - 0.00 in./yr (no water influx into the cells)
- 200-500 years - 0.054 in./yr
- 500-1,000 years - 1.08 in./yr.

Figure I.18 shows the water saturation profile with time, based on the STOMP model calibration run for one of the cell locations. The saturation curve changes in response to the change of water influx rate within the cell, especially after 500 years post-operations when a higher infiltration rate (1.08 in./yr) was applied. The figure also shows that the lower hydraulic conductivities in the lower Cuyahoga and Sunbury impeded the downward movement of water. The relatively more permeable sandstone layer in the Cuyahoga provides a preferable water pathway for horizontal movement.

Depending on the cell location (in relation to depth to the sandstone layer), the arrival times of water to the sandstone layer ranged from 550 to 600 years. It will take an additional 10-30 years for horizontal migration to occur and reach the sandstone exposure locations along the western stream ditch and X-611 Sludge Pond.

Initial moisture content assigned to the layers in the model has a large impact on the initial water arrival time. Additionally, the moisture content will impact the initial arrival time of constituents. However, the initial moisture content has less impact on peak concentration because the constituent mass flux from the OSDC footprint is controlled by the performance of the potential OSDC.

Using the solute-porous media and solute-fluid parameters, as discussed earlier, the fate and transport of the constituents are modeled. The waste zones in the cells are assigned as the source zone, and an initial unit mass concentration is assigned. The fate and movement of the constituents are then modeled to 1,000 years.

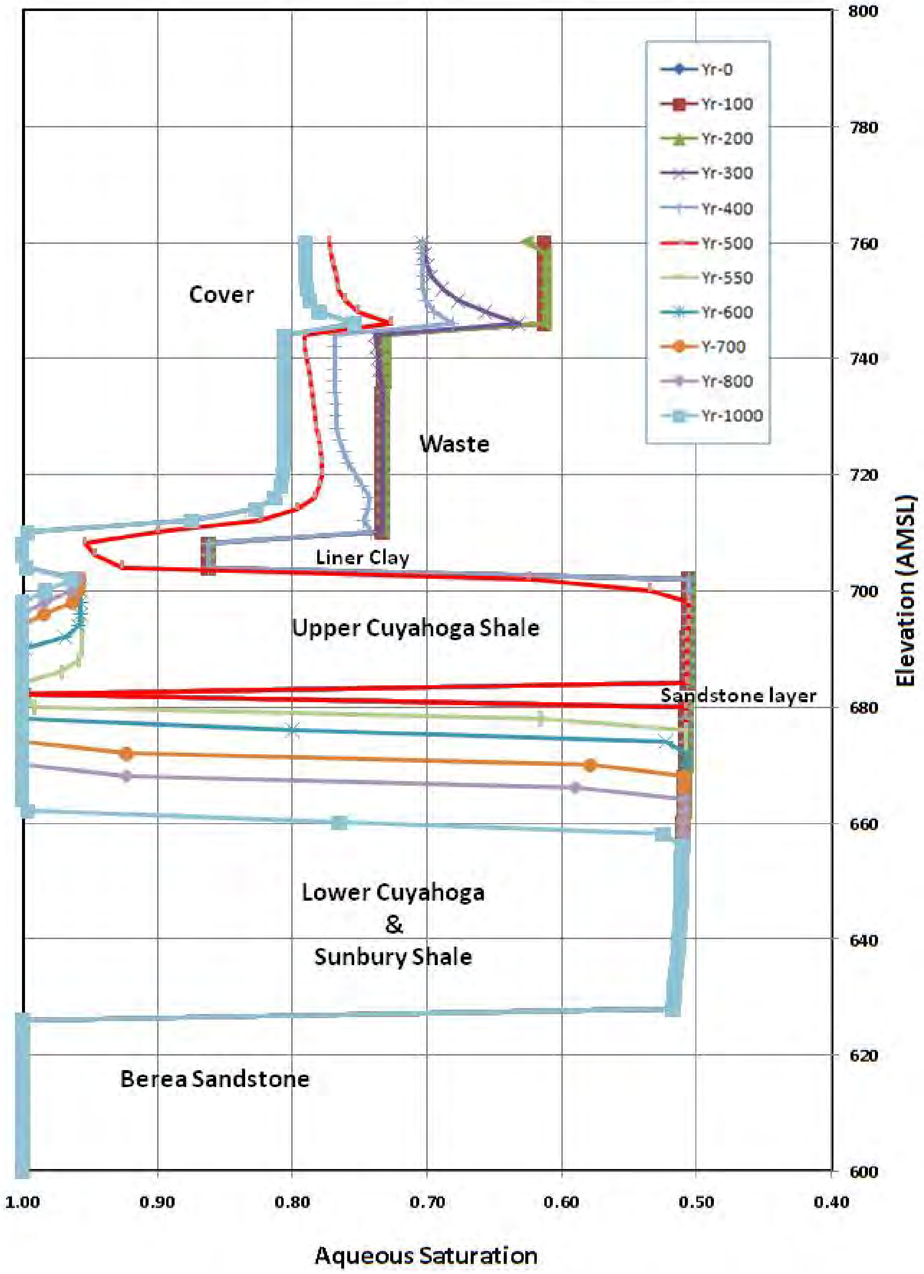

Figure I.18. Water Saturation Profile with Time in Site D at PORTS

The initial unit source concentration of 1 g/cm^3 is assigned for each COC. The source concentration (C) is a combined solute mass absorbed on soil (C_S) and dissolved in the aqueous phase (C_L), based on linear partitioning of solutes between the porous media and aqueous phase:

$$C = C_L \times \text{Porosity} \times \text{Aqueous initial saturation} + C_S \times (1 - \text{porosity})$$

where $C_L = C_S / (K_d \times \text{Particle density})$.

Therefore, the source concentration of each solute at the source in the model simulation is dependent on the source K_d values. The initial aqueous saturation of 0.73 for the source zone is based on HELP model results. It is the ratio of field capacity and porosity. Based on this K_d relationship, the initial source leachate concentration calculated for the organic COCs are higher than their respective solubility limits. Therefore, for these COCs the initial source leachate concentration will be set to the solubility limits.

It should be noted that the mass of constituents considered in the waste placed in a potential OSDC would be subjected to processes that result in reduction over time, including:

- Mass removed during cell operations by contact water collection and removal
- Mass removed by the leachate collection system between years 0 and 500
- Mass migration to beneath the potential OSDC and potentially to environmental media after 500 years.

Batch leach test results conducted using samples from the PGE at PORTS confirmed that contaminant mass may be reduced during initial potential OSDC operations, throughout the operation of the leachate collection system, and due to the reducing geochemical environment along the migration pathway (DOE 2013). However, for conservatism, these processes are not considered in the STOMP model. Therefore, all constituent mass that would be present in the waste when the potential OSDC is capped is assumed to be available for migration to the environmental media, resulting in overestimation of the resultant concentrations and thus lower modeled WAC limits.

As shown in Figure I.19, the 680-ft sandstone layer becomes the major migration pathway for COC movement due to the lower permeability nature of the lower Cuyahoga. Thus, the movement of COCs within the 680-ft sandstone layer is analyzed. As previously stated, the 680-ft sandstone layer tilts to the southeast at Site D. With the design of the conceptual OSDC at Site D, the facility would have the highest cell, relative to the sandstone layer, on the east side, with the bottom of the facility stepping down closer to the sandstone layer toward the west end. Therefore, the vertical distance between the bottom of the facility and the 680-ft sandstone varies across the potential OSDC with the highest in the southeast corner, and it gradually decreases to the west. Because the migration of the COCs occurs within the unsaturated zone, the plume development with time in the 680-ft sandstone layer is influenced by the thickness of the unsaturated zone relative to the bottom of the facility.

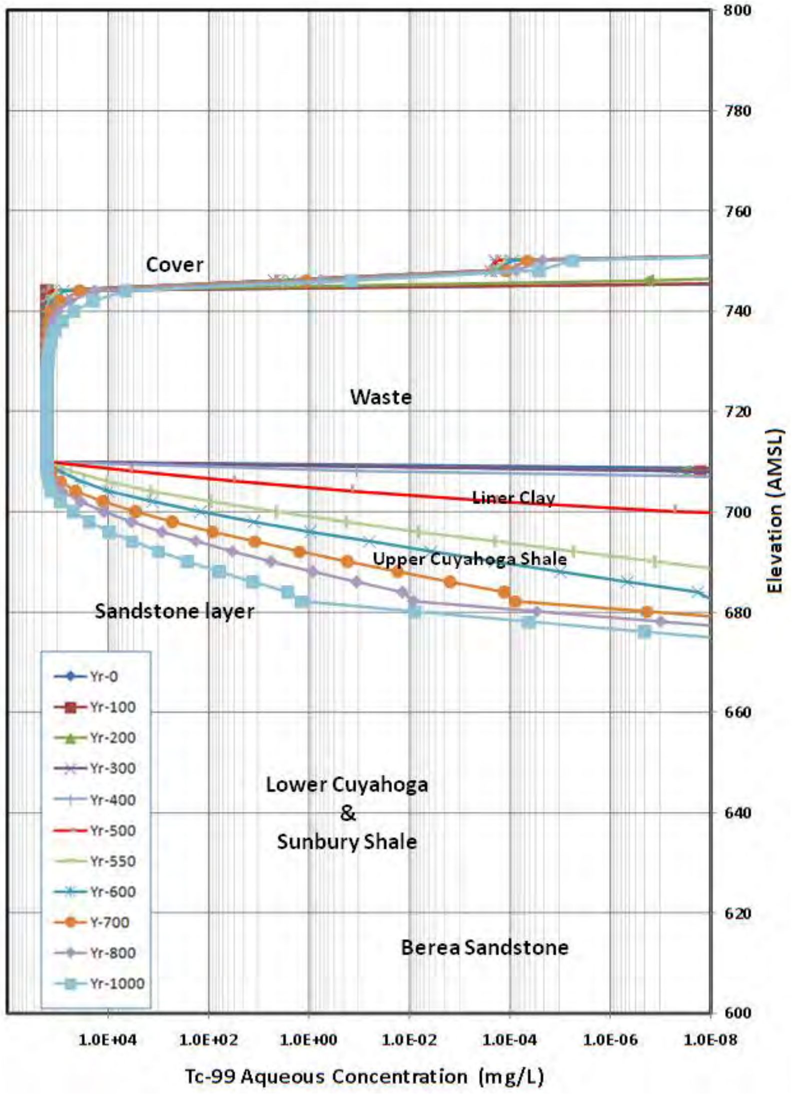

Figure I.19. Technetium-99 Fate and Transport within a Vertical Profile Beneath a Cell

Figure I.20 shows both the model predicted water flow field and technetium-99 relative concentration distribution at various time steps after a potential OSDC closure. At year 500, there is no impact in both water flow direction and contaminant concentration in the 680-ft sandstone layer. Water, along with contaminant mass from a potential OSDC, will reach the 680-ft sandstone layer in year 600, with the highest impact occurring directly beneath Cell #11 because of the underlying shortest vertical distance between the waste and 680-ft sandstone layer. Due to the higher recharge rate assumed for the waste cell area (1.08 in./year), the model predicts that the groundwater potentiometric head will gradually increase and form a groundwater mound near the center of a potential OSDC. As a result, the COCs will gradually spread horizontally within the 680-ft sandstone layer. Over time, the plume will increase in lateral extent, as shown in the time progression figures between 600 and 1,000 years. As depicted in Figure I.20, the plume will have the greatest migration impact to the west and northwest of the cell. When the plume reaches the 680-ft sandstone layer daylight locations, it will discharge to the surface resulting in concentrations in surface soil and water at the discharge locations.

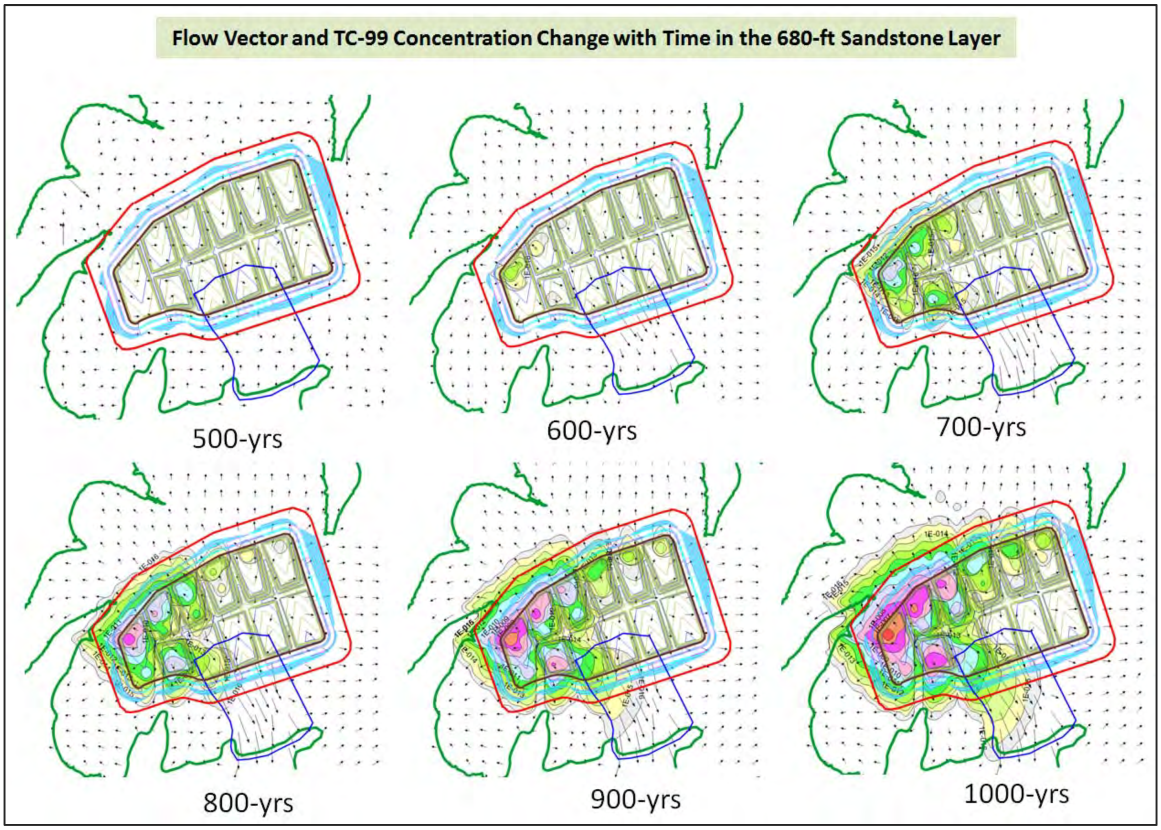

Figure I.20. Flow Vector and Technetium-99 Concentration Change with Time in the 680-ft Sandstone Layer

As discussed in Section I.2, various POAs are considered for modeled WAC development. Based on the model sensitivity runs, the POAs were located to the maximum impact location based on the following criteria:

- COC concentration distribution at 1,000 years
- 680-ft sandstone exposure distance to a potential OSDC
- Suitable topography and land area
- Regulatory requirement and DOE boundary location.

In all cases, the maximum impact location (worst case) is used for modeled WAC development to derive the lowest modeled WAC. The highest concentration at 300 ft from the waste unit is used for POA-2 and POA-3. For POA-1, the location with the maximum concentration is also used. For POA-4, which assumes a potential resident farmer scenario, the receptor location with the maximum plume migration potential is used. A DOE boundary location with the shortest downgradient distance to a potential OSDC is used for POA-5. Figure I.21 shows the POA locations that were used to calculate the lowest modeled WAC for each pathway.

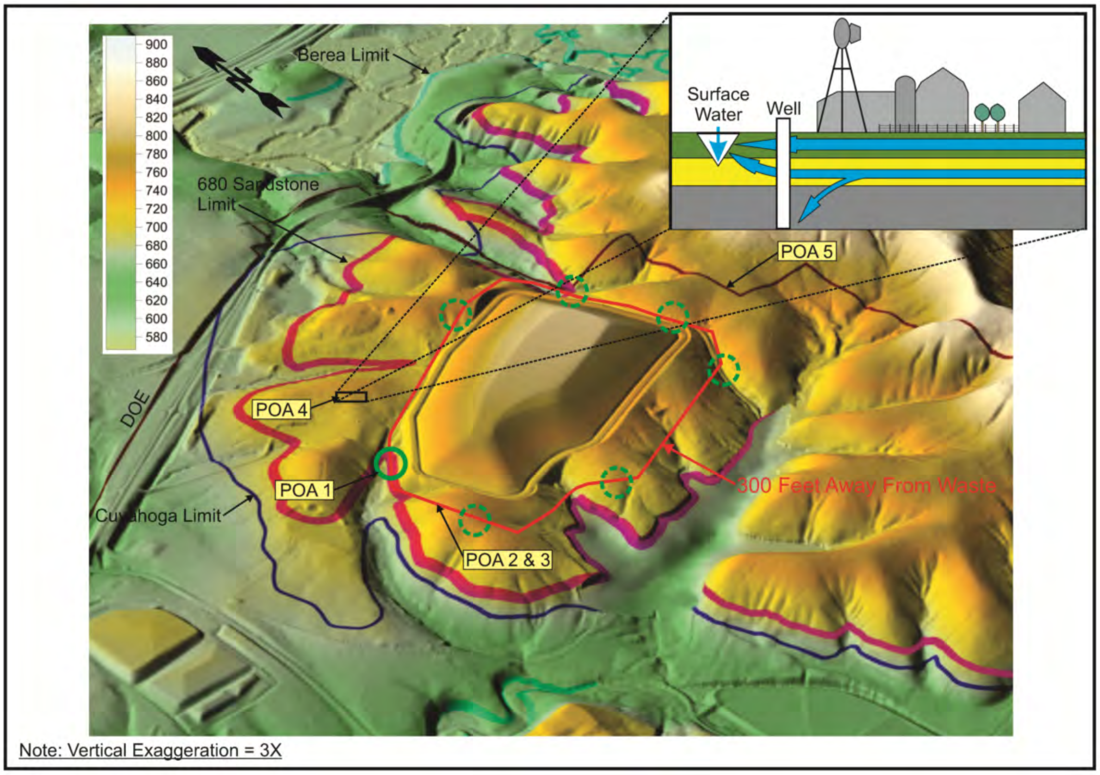

Figure I.21. Point of Assessment Locations for which Waste Acceptance Criteria are Modeled

Extensive sensitivity analyses were conducted before the final STOMP model simulation to determine the best condition representation for the modeling effort. All potential influence parameters, including hydraulic conductivity of the 680-ft sandstone, hydraulic anisotropic ratios, surface water boundary conditions, and recharge rates outside of the cell, were analyzed. Table I.15 lists the sensitivity runs and their potential impacts to the model results for flow and concentration in the 680-ft sandstone. Based on this sensitivity analysis, the base model was determined to have the best representation for the WAC modeling effort.

Table I.15. Results of Sensitivity Runs for the STOMP Model

Sensitivity Scenario	Impact on Flow and Concentration of 680-ft Sandstone Layer
Hydraulic conductivity vertical ratio (Kx/Kz) for upper Cuyahoga shale	Minimal impact on flow or concentration
Uniform hydraulic conductivity distribution (with higher K)	Lowered concentration in exposure locations
Hydraulic conductivity value of 680-ft sandstone layer (uniform higher)	Slightly higher concentration (less than 20 percent) to north and west, lower in other areas
Anisotropic ratio - (Kx/Kz) of 680-ft sandstone layer	Minimal impact
Initial saturation impact of 680-ft sandstone layer	Minimal impact at 1,000 years
Impact of 2-ft vs. 5-ft sandstone layer thickness	Slightly higher concentration with 2-ft zone (less than 50 percent)

Table I.15. Results of Sensitivity Runs for the STOMP Model (Continued)

Sensitivity Scenario	Impact on Flow and Concentration of 680-ft Sandstone Layer
Larger higher K zone in the south	Reduced exposure concentration at west and north
Waste placement impact (1.5 times in Cells 1-6; 0.5 times in Cells 7-11)	Lower concentration in exposure locations
Lower Cuyahoga Kx/Kz (10/1)	No impact on concentration in 680-ft sandstone layer at 1,000 years
Localized higher recharge rate outside cell	Reduced exposure concentration
X-611B future condition impact	Minimal impact at 1,000 years

The base model was then used to conduct fate and transport analysis for all 106 COCs to derive modeled WAC. The COC concentration distribution in the 680-ft sandstone layer for each COC was processed to determine the maximum concentration at 300-ft locations (POA-2 and POA-3) and the daylight location (POA-1), and the concentration at the farmer scenario (POA-4). The concentrations were then used to compare with respective POA-specific performance standards to calculate the maximum allowable waste concentrations in the source area (i.e., draft modeled WAC).

Figure I.22 shows the radionuclide aqueous concentration variation with time at the waste source zone within a cell. The line represents the ratio of aqueous concentration over time to initial aqueous concentration at the source zone. The concentration decreases with time as a result of radioactive decay and migration out of the source zone. A fast decrease in concentrations of thorium-228, plutonium-238, and americium-241 are caused by their fast radioactive decay (short half-life). Other radionuclides show very little source reduction as a result of long radionuclide half-life and negligible migration over the 1,000-year time frame.

Inorganic constituent concentrations in the source zone are shown in Figure I.23. All of the inorganic constituents are relatively immobile within the first 1,000 years because of higher K_d values.

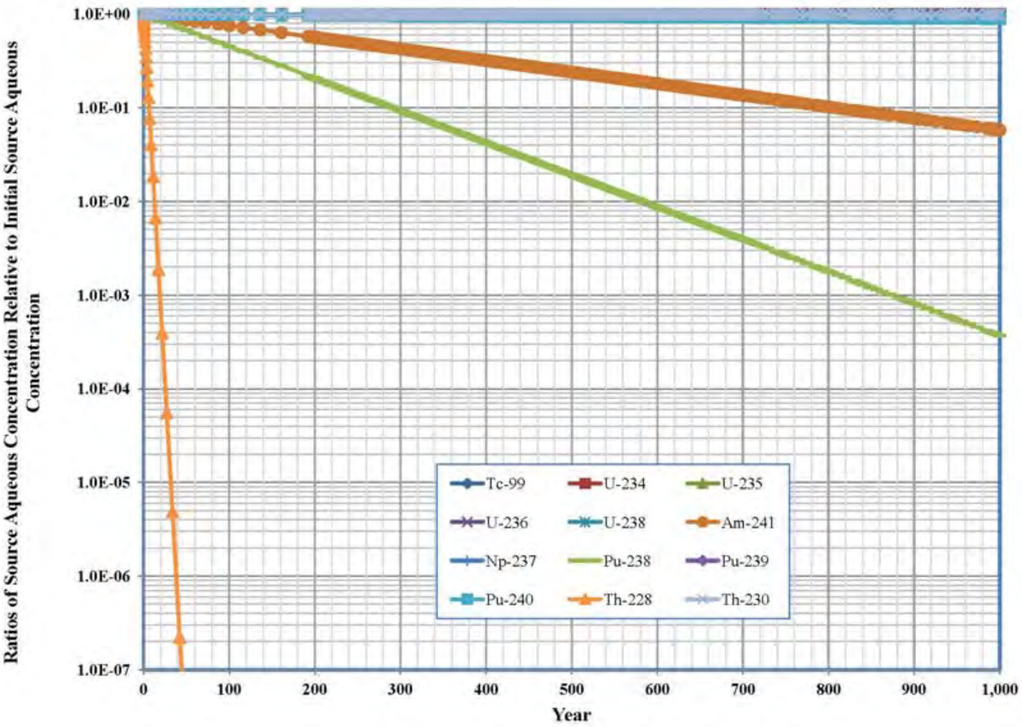

Figure I.22. Radionuclide Contaminant of Concern Aqueous Concentration Change in the Source Zone

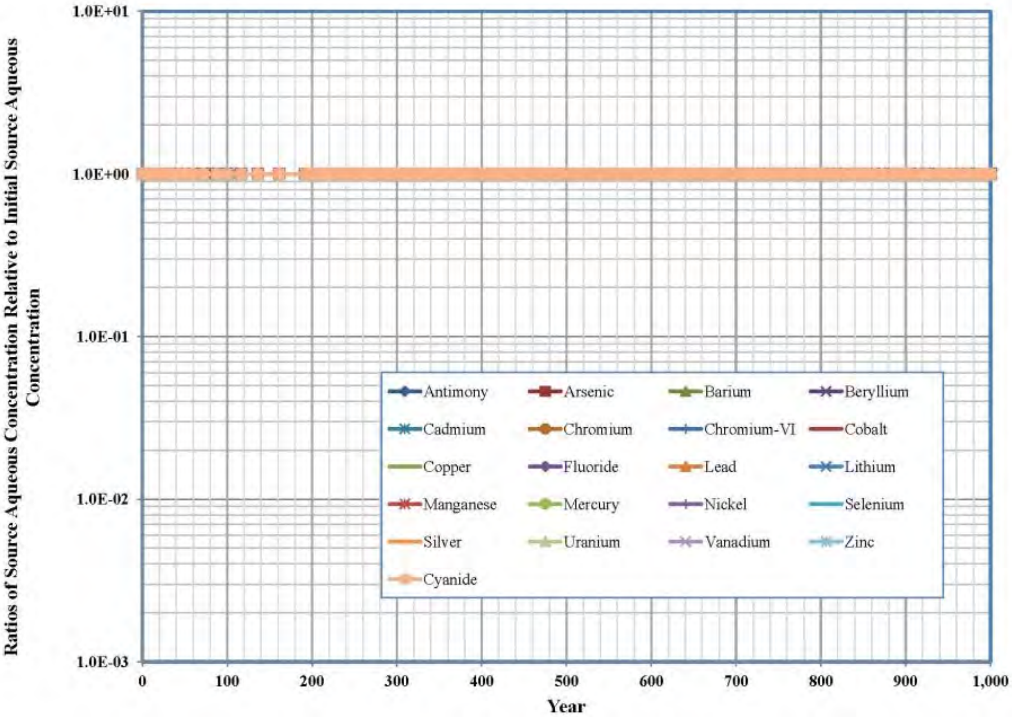

Figure I.23. Inorganic Contaminant of Concern Aqueous Concentration Change in the Source Zone

The fate of selected organic constituents in the source zone is shown in Figure I.24. The source concentrations for these constituents decrease rapidly with the occurrence of biodegradation, which is defined by a constituent's half-life. Some of the constituents have half-lives of less than 1 year.

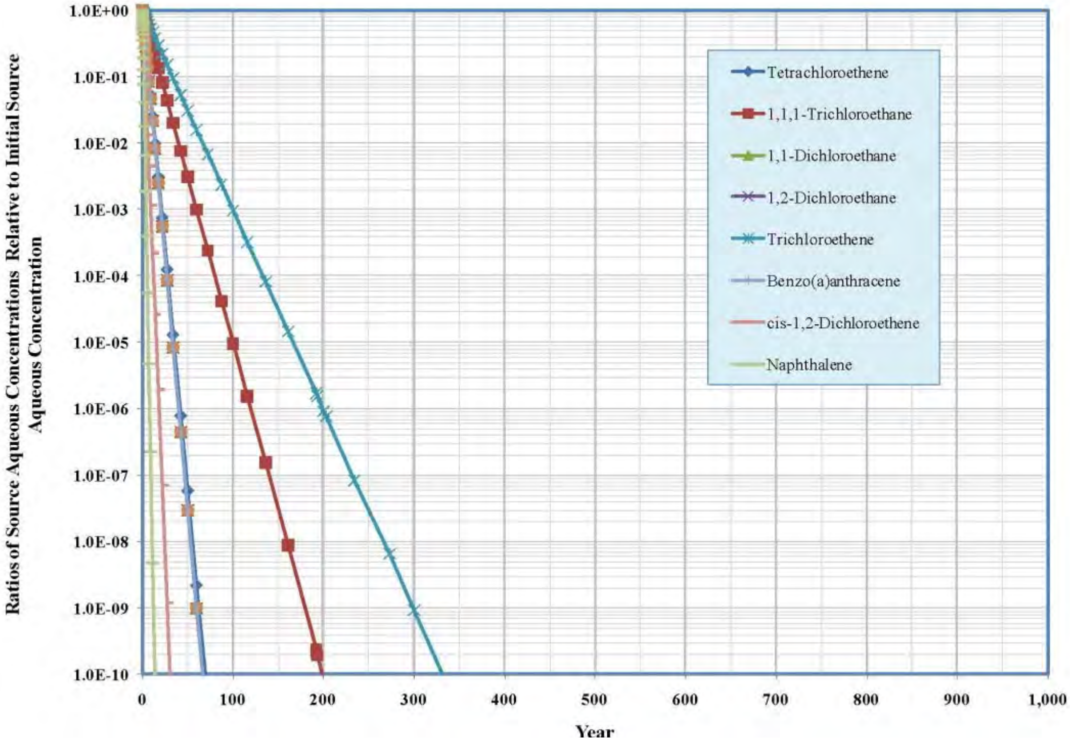

Figure I.24. Organic Contaminant of Concern Aqueous Concentration Change in the Source Zone

Model-predicted concentration profiles of radionuclide constituents at the sandstone layer location at the facility boundary (300 ft from the unit boundary) are presented in Figure I.25. This location is predicted to have the highest migration impact from a potential OSDC. The curves represent the ratios of aqueous concentration over time to the initial source aqueous concentration. The concentration curve for technetium-99 shows an increasing trend during the modeled WAC compliance period (1,000 years). However, the aqueous concentrations are extremely low. All other radionuclides will not reach the POA within the 1,000-year compliance period.

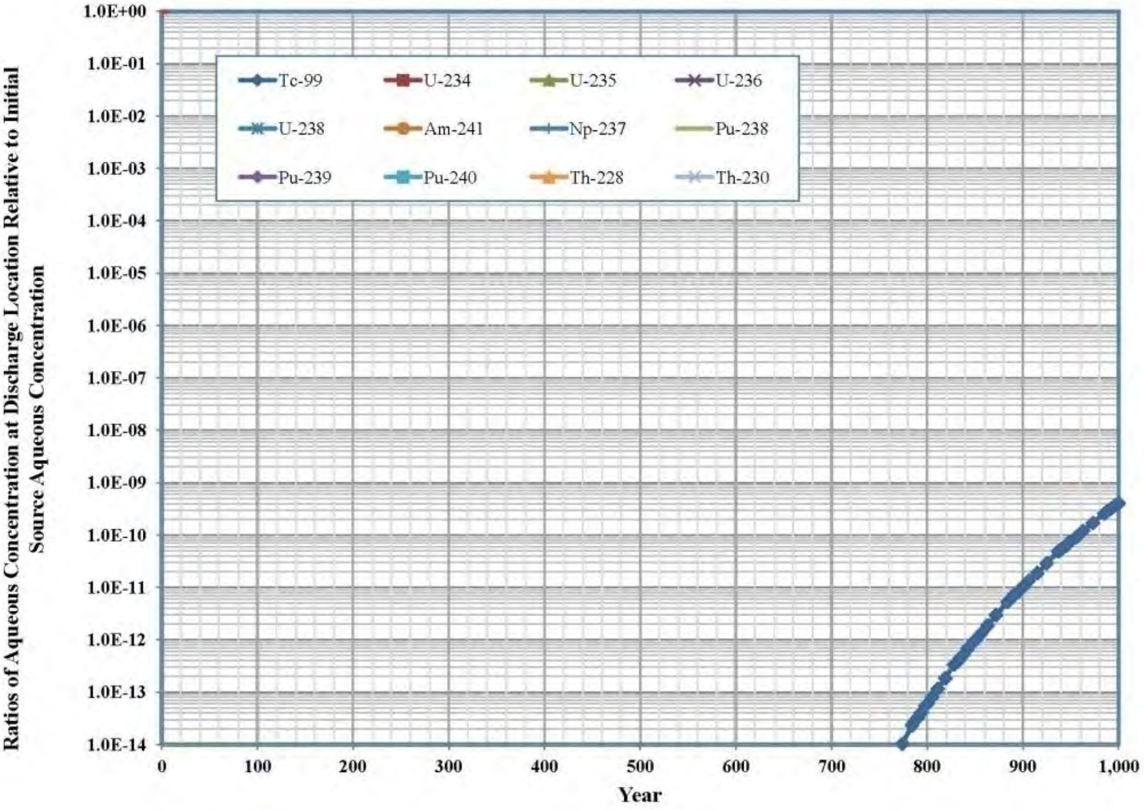

Figure I.25. Concentration Profile of Radionuclide Constituents at the Potential Sandstone Layer Receptor

Figure I.26 shows the inorganic constituent profiles at the same west receptor location. The most mobile contaminants within the 1,000-year compliance period are chromium-VI, silver, and cyanide, all showing increasing trends although the aqueous concentrations are extremely low. As expected, both the arrival time and concentration magnitude are controlled by the K_d values for these constituents.

No organic constituents are shown to migrate to the 680-ft sandstone layer because of either their short half-life or higher K_d values (>10 mL/g).

As discussed earlier, there is no migration of any of the constituents to the Berea sandstone groundwater from a potential OSDC within the modeled WAC compliance period.

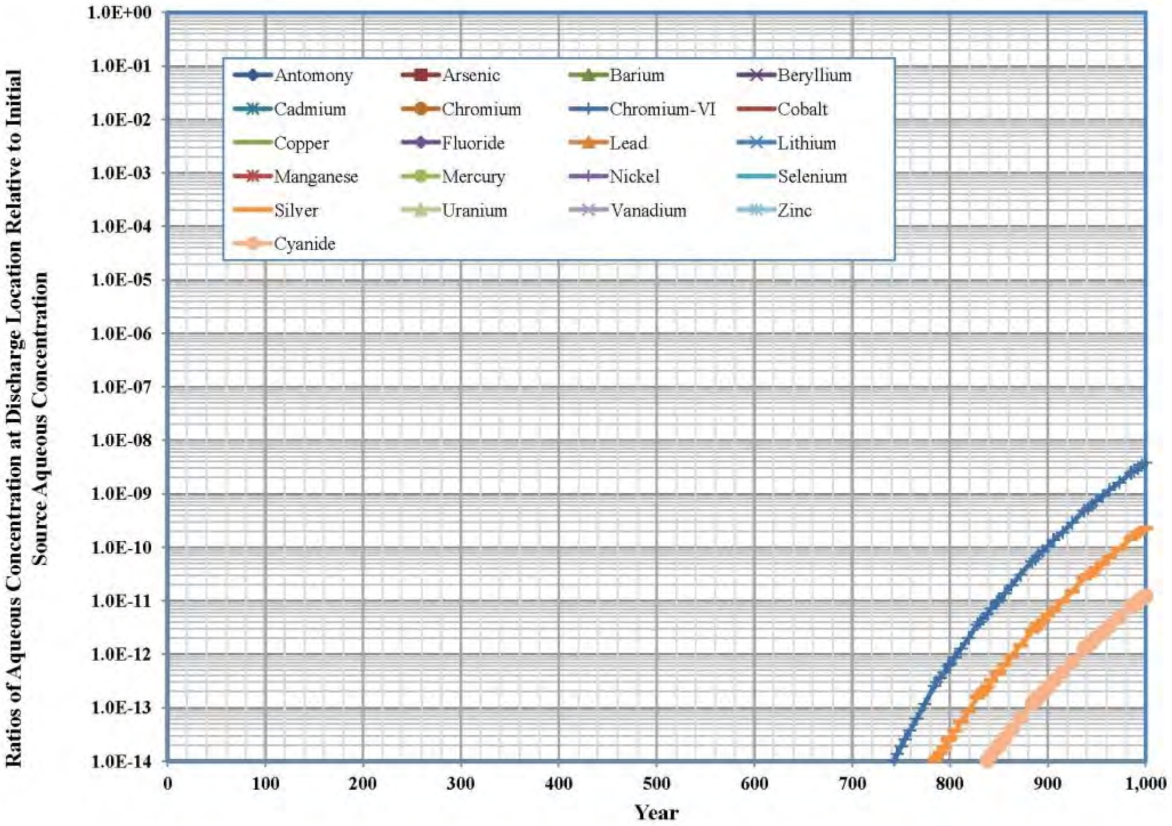

Figure I.26. Concentration Profile of Inorganic Constituents at the Potential Sandstone Layer Receptor

Table I.16 lists the initial source aqueous concentration for a unit source of 1 gm/cm^3, the initial arrival and peak times, and the maximum ratio of aqueous concentrations relative to the initial source concentration predicted for all the constituents within the 1,000-year compliance period for POAs -1, -2, and -3. For POA-2 and POA-3, only technetium-99, uranium-234, uranium-235, uranium-236, uranium-238, chromium VI, silver, and uranium (total) are predicted to arrive between 640 and 900 years post-closure. Only technetium-99, chromium VI, and silver are predicted to arrive at year 700 at extremely low concentrations at POA-1. There is no migration of any organic COC to any of the POAs within the 1,000-year compliance period.

Table I.17 lists the initial source aqueous concentration for a unit source of 1 gm/cm^3, initial arrival and peak times, and maximum ratio of aqueous concentrations relative to the initial source concentration predicted for all the constituents within the 1,000-year compliance period for POAs -4 and -5. As noted, only technetium-99, chromium VI, and silver are predicted to arrive at year 800 at extremely low concentrations at POA-4. There is no migration of any organic COC to POA-4 within the 1,000-year compliance period. Finally, the model predicts that no COC will migrate to POA-5 within the 1,000-year compliance period.

Table I.16. Model-predicted Constituent Arrival Time and Maximum Relative Concentration for POAs -1, -2, and -3

COC	Waste Source Zone	POA-1 (680-ft Sandstone Layer of Cuyahoga Shale Exposure Points)			POA-2 (680-ft Sandstone Layer - 300 ft Away from Waste Limit)			POA-3 (Berea Sandstone Groundwater Mixing with 680-ft Sandstone - 300 ft Away from Waste Limit)		
	Initial Aqueous Concentration (g/mL) for an Initial Source (Solid+Aqueous) Concentration of 1 (g/cm^3)	Arrival Time (years)	Time (year) of Peak Concentration	Maximum Ratio of Aqueous Concentration to Initial Source Aqueous Concentration at 1,000 years	Arrival Time (years)	Time (year) of Peak Concentration	Maximum Ratio of Aqueous Concentration to Initial Source Aqueous Concentration at 1,000 years	Arrival Time (years)	Time (year) of Peak Concentration	Maximum Ratio of Aqueous Concentration to Initial Source Aqueous Concentration at 1,000 years

COC = contaminant of concern
DOE = U.S. Department of Energy
NA = not available due to no migration to POA within 1,000 years.
NAP = not applicable due to no COC migration to POA
OSDC = on-Site disposal cell
POA = point of assessment

I.5.2.3 MODFLOW and MT3D Models

In anticipation of the potential impact to the Berea groundwater from a potential OSDC, a 3-D groundwater model was developed for a potential OSDC at Site D. The groundwater model was constructed using the MODFLOW code. The model domain is shown in Figure I.27. The boundary conditions were set up so the natural flow conditions were used. This model consists of 840 columns and 784 rows with a grid space from 10 to 20 ft. The refined grid allows a detailed representation of the potential OSDC engineering design and key surface features. Seven model layers are used to represent the vertical variation of the hydrological units at the site. The model has over 4.6 million model grids. Figure I.28 shows the model construction summary.

Figure I.28. Site D Groundwater Model Summary

All identified hydraulic units in the area were represented in the model. Figure I.29 shows the model representation of the units in the model top layer and its west-east cross section. Three recharge rates were applied to the top of the model, based on rock and soil types: 4 in./yr was used for the Minford and Gallia formations; 0.4 in./yr was used for the X-735 Landfill; and no recharge was used for the Cuyahoga shale. Due to the thickness of the Cuyahoga shale and the confining nature of the Berea beneath the Cuyahoga and Sunbury shales, it is expected that no precipitation recharge will occur into the Berea sandstone in areas overlaid by the Cuyahoga and Sunbury shales. The hydraulic properties assigned to these units are summarized in Table I.18.

Preliminary model calibration to the current groundwater information at the site was conducted. The model predicted that the flow pattern will be similar to that in the conceptual model.

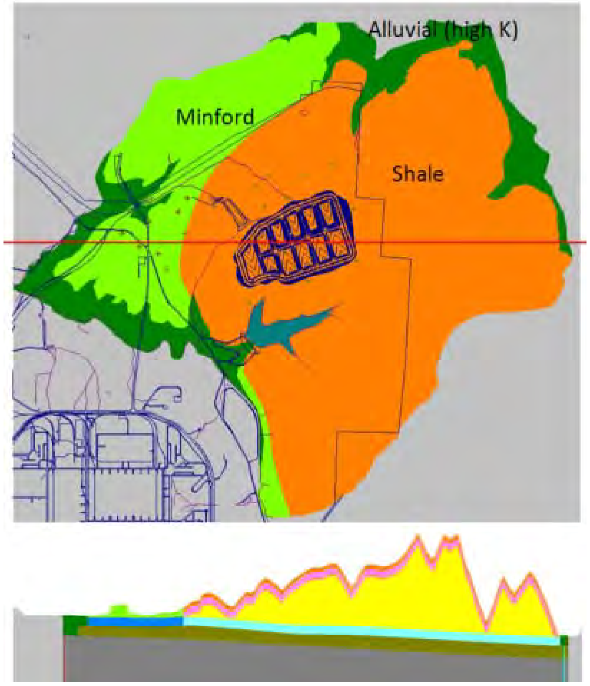

Figure I.29. Model Representation of the Units in the Model Top Layer and Cross-section View

Table I.18. Hydraulic Unit Parameter Summary

Rock/Soil Type	Represented within Model Layer	K(x) (cm/s)	K(y) (cm/s)	K(z) (cm/s)
Regolith	1	2.50E-04	2.50 E-04	5.00 E-05
Weathered Cuyahoga	2	5.00 E-05	5.00 E-05	1.00 E-05
Fractured Cuyahoga	3	2.50 E-05	2.50 E-05	5.00 E-06
Competent Cuyahoga	4	1.30 E-08	1.30 E-08	1.30 E-09
Sunbury shale	5	4.40 E-08	4.40 E-08	4.40 E-09

X-611 Sludge Basin	1,2,3	1.00 E-04	1.00 E-04	1.00 E-04

K = hydraulic conductivity

The MODFLOW model, along with MT3D code, may be linked to the unsaturated zone model to predict the potential contaminant impact to Berea groundwater at the site and any off-Site location. However, the STOMP model simulation indicated that there will be no contaminant migration to the Berea sandstone within the time frame considered.

I.5.3 MODELED WASTE ACCEPTANCE CRITERIA

In order to calculate draft modeled WAC, the maximum COC concentration predicted at each POA within 1,000 years post-closure was compared to the its respective performance standard as listed in Table I.6. For the surface water/sediment pathway (POA-1), it is assumed that the surface water concentration discharged from the sandstone layer is at the concentration of the groundwater in this layer and that no mixing or dilution with existing surface water occurs. The resulting soil concentration from the discharging seepage is calculated using the K_d relationship previously described. The site-specific Minford K_d values for radionuclides from Table I.12 are used, while the Minford K_d values from Tables I.13 and I.14 were used for other constituents. The lower value of the three performance standards for each COC is used for the draft modeled WAC calculation.

For the 680-ft sandstone groundwater contribution to the Berea groundwater open-hole pathway, an analysis was conducted to determine the contribution percentage. The analysis used both an analytical method of water-bearing zone transmissivity and a numerical method using a 3-D groundwater model of steady-state and transient-state simulation under applicable pumping conditions.

For the analytical method, a constant transmissivity analytical method was used. Thus, the well pumping rate is proportional to the transmissivity of the layers. Assuming the 680-ft sandstone layer and the Berea sandstone have the same hydraulic conductivities and the water will be withdrawn from the total length of the well with both water bearing units, the analytical method yields a result of 5.4 percent contribution of water from the 680-ft sandstone layer to the well completed in the Berea sandstone. The assumption that water is simultaneously withdrawn from the total length of the water-bearing open hole is conservative, resulting in over estimating the percent contribution from the 680-ft sandstone layer. In reality, a groundwater pump is placed in the bottom of the well to provide the maximum yield. When the well is pumped from a confined layer such as the Berea sandstone, the water flow to the well is likely from aquifer storage in the immediate vicinity of the pump. For sedimentary sandstone rock, the water will be drawn preferably from the horizontal directions due to higher permeability in this direction. An additional conservatism is the constant transmissivity for the 680-ft sandstone layer. Due to this layer’s limited thickness, the transmissivity from the 680-ft sandstone layer will mostly likely decrease due to drawdown (further reducing the water-bearing layer thickness) at the well location, rather than remain constant. This is the most likely scenario if a high-rate pumping scenario occurs with the Berea aquifer if an open hole exists.

A well drawdown analysis under various usage pumping scenarios typical for domestic use was also used to calculate the 680-ft sandstone water contribution. This method assumes that the bore hole void space above the Berea potentiometric surface is filled with water from the 680-ft sandstone layer. Pumping from a Berea aquifer will cause drawdown in the well, with the water in the drawdown portion of the well above the Berea assumed to be all from the 680-ft sandstone layer. A simplified 3-D flow module within the MODFLOW groundwater model was developed to calculate drawdown from a heterogeneous multi-layer aquifer. Eleven model layers were used to represent the aquifer, water bearing layers, and aquicludes based on Site D site-specific data and K values. Various steady-state and transient-state pumping scenarios representing usage for a family of four, typically 240 gal/day, were conducted for a 6-in. typical water supply well. Based on the modeling results, the calculated contribution percentages ranged from 0.5 to 3.0 percent.

The higher of the simulated values for percent water contribution from the 680-ft sandstone layer to a Berea sandstone well (5.4 percent) based on the two methods described above is used to calculate the groundwater composite concentration in the well. This conservatism is considered to be more protective of human health.

The process used to derive the draft modeled WAC, based on the STOMP model simulation for these COCs predicted to have reached the respective POAs, are discussed below. The model-predicted maximum aqueous concentration for each constituent for a unit source of 1 g/cm^3 at the specific POA within the 1,000 years is compared to the lowest performance standard (allowable aqueous concentration [C-aq $_{\text{(allowable)}}$]) from Table I.5. The model-predicted maximum aqueous concentration at a given POA is equal to the concentration ratio times the initial aqueous source concentration. The modeled WAC is then calculated for the waste zone on the basis of the following relationship:

For nonradionuclide COCs,

draft modeled WAC (mg/kg) =
$[\text{C-aq}_{\text{allowable}} \div (\text{Concentration ratio} \times \text{C-aq}_{\text{initial source}})] \times [1\ (\text{g/cm}^3) \div \text{Bulk density}\ (\text{g/cm}^3)] \times 10^6$

where :

the concentration ratio is the ratio of the model predicted aqueous concentration at the POA to the initial aqueous concentration for an initial source concentration in the waste zone of 1 g/cm^2

10^6 is the unit conversion factor and C-aq$_{\text{allowable}}$ and C-aq$_{\text{initial source}}$ are in µg/L.

For radionuclide COCs,

draft modeled WAC (in pCi/g) =
$[\text{C-aq}_{\text{allowable}} \div (\text{Concentration ratio} \times \text{C-aq}_{\text{initial source}})] \times [1\ (\text{g/cm}^3) \div \text{Bulk density}\ (\text{g/cm}^3)] \times$ Specific Activity (Ci/g) × 10^{12}

where:

the concentration ratio is the ratio of the model predicted aqueous concentration at the POA to the initial aqueous concentration for an initial source concentration in the waste zone of 1 g/cm^2

10^{12} is the unit conversion factor and C-aq$_{\text{allowable}}$ and C-aq$_{\text{initial source}}$ are in pCi/L.

As shown in Table I.19, only technetium-99 and chromium VI have draft modeled WAC that are slightly lower than their respective specific activity or physical limit for POA-2. All calculated draft modeled WAC for the remaining radionuclides and inorganic constituents for other POAs within the 1,000-year compliance period are higher than their respective specific activity or physical limit. Further, none of the organic COCs are modeled to reach the respective POAs within the 1,000-year compliance period,. Based on the analysis performed herein, the exposure scenarios considered (within the compliance period of 1,000 years), and the use of risk-based and MCL-based performance standards, waste from the D&D of PORTS (RC-1) that complies with other DFF&O-required WAC elements, including regulatory-based activity and chemical concentration WAC, may be safely managed in a potential OSDC at Site D.

[1] Modeled WAC, representing the activity concentration and chemical concentration criteria based solely on protection of human health and the environment, are only one of six DFF&O-required WAC, of which full compliance with all DFF&O WAC is required for disposal in a potential OSDC.

Green = Not restricted due to no migration to POA within 1,000 years.
Yellow = Not restricted due to very low concentration at POA within 1,000 years.

Note: A waste density of 1.84 g/cm^3 is used to calculate the limit.

COC = contaminant of concern
DFF&O = *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto*
OSDC = on-Site disposal cell
POA = point of assessment
WAC = waste acceptance criteria

It should be noted that significant accumulation of COCs in soils and sediments associated with mineral precipitates at the sandstone layer discharge locations, which may form as a result of reduction-oxidation (redox) reactions when water from the sandstone layer daylights, is not expected for several reasons. First, the OSDC design performance requirements limit the migration of radionuclide and inorganic constituents out of the OSDC and to POA-1 within a 1,000-year timeframe. As shown above, only a few inorganic COCs (technetium-99, chromium VI, silver, and cyanide) are predicted to reach POA-1 within this timeframe. Second, the reducing geochemical environment along the migration pathway, predominately due to pyrite within the sandstone layer, will likely result in precipitation of the major COCs (i.e., uranium and technetium) within this layer, resulting in an overall mass reduction of the COCs released at POA-1. Third, although there is a high affinity for uranium and technetium to be sequestered in iron oxy-hydroxide precipitates at POA-1, there would be very little accumulation of these major COCs in soils and sediments at POA-1 because uranium and technetium concentrations will be very low in the seep water as a result of reducing conditions along the flow path. Fourth, the most restrictive (i.e., lower) media-based risk standards were used at POA-1 as the basis for protecting human health and the environment. For the major COCs, these standards were the surface water-based concentrations, which are well below their respective soil-based standards. Therefore, if the risk standards for surface-water are met at POA-1, there is little concern for risk from the COC levels in soil and sediment. Finally, based on mass flux estimates at POA-1, it is expected that seep water would be of insufficient volume to generate a redox precipitate of sufficient mass to affect the soil-based standards within the 1,000-year timeframe.

I.5.4 AIR PATHWAY ANALYSIS FOR RADON-222 ABOVE THE OSDC CAPS

DOE Order 435.1 requires the radon flux above the cap of a low-level (radioactive) waste disposal facility to be less than 20 pCi/m^2/s above background over a period of 1,000 years. The calculations discussed and presented here indicate that the level of uranium needed to produce a radon-222 flux of 20 pCi/m^2/s above background at 1,000 years is over 1,000 times greater than the uranium mass expected to be placed in the potential OSDC.

Calculations are carried out according to the equations and default parameters in *Radon Attenuation Handbook for Uranium Mill Tailings Cover Design* (NRC 1984) using the material property values from the potential OSDC design (Geosyntec 2012). The calculations and input values are provided in Attachment I-1.

Radon-222, with a half-life of 3.7 days and a daughter in the uranium-238 decay chain, is the only radon isotope with a half-life sufficient to be of concern for transport through the waste and cap. Radon-219, with a half-life of 4.0 s and a daughter in the uranium-235 decay chain, has a half-life that is too short to survive transport through the waste and cap. Radon-220, with a half-life of 56 s, is not considered because it has a short half-life and it is a daughter of thorium-232, which is not a significant parent nuclide in the estimated radionuclide inventory for a potential OSDC at PORTS.

The nuclide that is entered into the radon flux calculation is radium-226, a daughter isotope that is also in the uranium-238 decay chain as the predecessor nuclide to radon-222. At PORTS, there is no detectable quantity of radium-226 in the uranium products processed in the plants, because radium-226 was removed from the uranium-238 decay chain when uranium was purified and converted to uranium hexafluoride prior to processing. Therefore, radium-226, with a half-life of 1,600 years, is not an isotope of concern for PORTS, but it will be produced by the decay of uranium-238, uranium-234, and thorium-230 (nuclides found at PORTS) over the 1,000-year assessment period for a low-level (radioactive) waste disposal facility.

Through an iterative calculation process, it is determined that 385 pCi/g of radium-226 in the waste will produce a radon-222 flux of 20 pCi/m^2/s above a cap with a geosynthetic clay liner and geomembrane no longer effective (a degraded cap). To produce this activity of radium-226 over 1,000 years requires a substantial inventory of uranium-238 to be present in the initial waste streams deposited in the potential OSDC. The amount of uranium-238 needed to yield 385 pCi/g of radium-226 can be calculated using the radium-226/uranium-238 ratio at 1,000 years. This ratio is obtained by performing a Bateman calculation to derive the radium-226/uranium-238 ratio as a function of time.

A Bateman calculation was performed assuming a maximum curie inventory for uranium-238 (87.6 Ci), uranium-234 (188 Ci), and thorium-230 (0.603 Ci) in a potential OSDC to determine the daughter ingrowth in the uranium-238 decay chain over a period of 1,000 years (Savannah River National Laboratory 2013). This calculation yielded a radium-226/uranium-238 activity ratio of 0.00611 at 1,000 years, which means every curie of uranium-238 produces 0.00611 Ci of radium-226 in 1,000 years. As the maximum estimate for uranium-238 is 87.6 Ci, the maximum amount of radium-226 that can be produced in 1,000 years is 0.535 Ci (87.6 × 0.00611). For an average waste density of 1.6 g/cm^3 and 4 million cy of waste, this amount of radium-226 equates to 0.109 pCi/g, which is over 3,000 times lower than the radium-226 activity of 385 pCi/g that is needed to produce the allowed radon-222 flux of 20 pCi/m^2/s above background. This also shows that the estimated maximum inventory for uranium-238 is less than 1 percent of the uranium-238 needed to produce the radon-222 flux of 20 pCi/m^2/s above background. Therefore, the above analysis and radon calculations in Attachment I.1 demonstrate that the radon levels above the cap at 1,000 years will not exceed 20 pCi/m^2/s above background.

I.5.5 SENSITIVITY AND UNCERTAINTY ANALYSIS

There are several uncertainties that may affect the draft modeled WAC modeling results. These uncertainties include site-specific conditions, fate and transport parameters, and potential OSDC conceptual design performance assumptions.

The largest potential impacts to the modeling results are associated with the OSDC performance assumptions for the engineered layers because these assumptions have a direct effect on the source release rate, which manifests as the carrier of the constituents from the disposal cells within the time period considered. For the modeling effort, lower performance assumptions, in terms of the degradation of landfill design components, are used which results in slightly higher modeled release rates than what may actually occur. Further, it is likely that the degradation rates of the facility cover and base liner layers may be different resulting in changes to the moisture content of the waste zone which may increase the source release rate within the first 500 years. However, any such changes would effectively increase the movement of only the more mobile constituents, which are those with lower K_d values.

The models used a soil/water partition relationship to describe the release of the constituents. Thus, the fate and transport parameters, specifically K_d for the source zone, will have direct impacts on the draft modeled WAC. Higher K_d values result in the contaminant being less mobile and thus it will remain in the source zone, whereas those constituents with preference to the aqueous phase (lower K_d) will move with water more readily. The K_d values used for the modeled WAC analysis are mostly within a low to medium range of reported values in the literature. For example, the K_d used for technetium-99 in waste, 2.03 (based on laboratory analysis using soil/rock samples from PORTS), is low, indicating a high potential for migration. This conservative K_d applies to the entire waste mass, which is made up primarily of soil (EC-1), although a high amount of waste other than soil (EC-2), including PGE, will be in the waste mass. The form of technetium-99 can vary, particularly within the barrier of the PGE, based on the chemical conditions. Under oxidizing conditions, technetium-99 is in the soluble and highly mobile oxy anion pertechnetate form, while under reducing conditions it is primarily in the hydrated oxide form, which is immobile. Nevertheless, for conservatism, the K_d for the more mobile form of technetium-99 was assumed for the waste since the potential OSDC will have a high soil mass which will largely be under oxidizing conditions initially and in the future when the facility begins to rehydrate following a dry phase (see Figure I.11). Final modeled WAC may be developed to consider alternative forms of waste such as scrap metal, concrete, and treated waste forms that will have different K_d values, which means the contamination in the modeled waste would be more or less mobile than assumed for soil-like materials. Although it is likely that contaminants released from variable forms of waste may be different than soil-like material, the overall release from the disposal cell to the underlying geologic layer is controlled by the predominant soil-like matrix of the waste.

Another uncertainty is the biodegradation rate of the organic constituents. Large ranges of half-lives are reported for these compounds. However, most of the literature studies show rapid degradation of these compounds in most environments, except in the presence of a dense, nonaqueous phase liquid source.

One important consideration for some of the constituents is the assumption that the draft modeled WAC calculation considers the time frame post-operations. The fate and reduction of the constituents during the cell operation time frame, often up to 20 years while the waste is being subjected to direct contact with large quantities of rainfall water, are not considered. For some uncontained mobile constituents, the concentration or mass could be reduced greatly during this period through biodegradation and source leaching and removal from the system in landfill water (contact water or leachate). Thus, the applicable modeled WAC for some of these more mobile constituents could be even higher than those calculated through this modeling effect. For most VOCs and some SVOCs, their half-lives during exposed conditions (direct sunlight, etc.) and during likely aerobic conditions are often in the range of days.

Much of the waste disposed in a potential OSDC would be waste that is not soil (EC-2) with the contamination likely occurring on the surface of the material. Thus, the contamination is subject to removal due to washing from precipitation and dust control methods during demolition as well as during cell operations. For this waste, the contaminant mass may be decreased significantly as a result before capping of the potential OSDC. The model and calculation did not consider this contaminant mass removal process, therefore the concentration ratios predicted may be higher than expected resulting in the actual draft modeled WAC calculated herein to be higher.

The waste volume for a potential OSDC is another source of uncertainty. The draft modeled WAC were modeled based on a waste volume of 5 million cy, which results in an 11 cell configuration and resultant areal footprint. Higher flux volumes and concentrations of COCs are generally expected with a larger waste cell footprint (increased waste volume). A higher draft modeled WAC would result for a smaller footprint (and lower waste volume).

The site condition refers to the characterization of the rock/soil mechanical and hydraulic properties. These parameters affect the fate and movement of the contaminants in the environmental media. The parameters, such as porosity, initial moisture content, and hydraulic conductivities, could affect the speed and travel time of the water in the model domain, especially in the predominantly unsaturated zone at Site D. Sensitivity runs during the STOMP simulations showed the water travel time impacts from these factors. Lower porosity or higher initial water content in the rock/soil types will result in a faster water travel time because the available air/pore spaces are lower and additional water may fill up the space quicker, thus promoting the downward movement of the water front. However, the impact on the contaminant concentration profile and maximum peak concentration is low because the contaminant mass flux is determined from the source zone and initial moisture water is free of the contaminant. The initial contaminant front is therefore diluted more with higher initial moisture content. For the lower initial moisture content media, the mass flux from the cell may arrive later, but the constituents would be in higher concentrations because there would be less dilution along their path.

Because the potential OSDC is on top of the Cuyahoga shale, any connected vertical fractures within the zone could also affect the travel time and create preferable flow paths. However, the current field investigation shows that the fractures in the rock are mostly developed along the horizontal bedding planes because of the difference in material types associated with geologic depositional history. The vertical fractures do not propagate across the bedding planes, suggesting the weathering phenomenon is associated with the horizontal bedding planes.

Climatic data used in the HELP model are from a database consisting of over 100 years of site-specific weather measurements. These long-term data used in the model provided the limits of the normal climate variation. Impact of climatic change on the modeled WAC, unless it is toward one end of an extreme and is sustained over very long periods such that the accelerated degradation of the disposal cell cover system and underlying geologic barrier occurs, would be very minimal.

I.6. SUMMARY OF THE DRAFT MODELED WASTE ACCEPTANCE CRITERIA

The predominant and long-term migration pathway of contaminants from a potential OSDC to human and ecological receptors is through contaminated water that exits the underside of a disposal facility, enters a saturated zone, and traverses laterally downgradient to a receptor located beyond a buffer zone surrounding the disposal facility. Thus, facility design greatly influences modeled WAC because a potential OSDC will include a cover and base liner consisting of multiple layers designed to (1) reduce water infiltration through the cap; (2) maximize leachate collection and leak detection; (3) minimize erosion; (4) prevent human, plant root, and burrowing animal intrusions into the wastes; and (5) retard exfiltration through the liner and into the underlying geologic materials. Additionally, chemical parameters such as the partition coefficient (K_d) control migration of constituents. The underlying geologic material will greatly influence migration, both in terms of flow direction and rate. Therefore, numerical modeling, incorporating water infiltration into the facility, constituent release from the waste matrix, vertical migration through the multiple layers of the facility and existing geologic strata, and ultimately horizontal migration with groundwater flow to the defined receptor location are required to establish modeled WAC.

The list of COCs from the risk assessment (Section 5) in the RI/FS report provides the initial set of constituents for which draft modeled WAC are derived. The COCs are expanded by sampling information from the process buildings and from environmental media. Next, additional constituents found on the RCRA TCLP list were added to ensure that COCs present in contingency waste volumes are represented. Finally, as surrogate constituents, those COCs determined to be present in similar DOE landfills were added to ensure a comprehensive modeled WAC for a potential OSDC at PORTS. In accordance with the DFF&O, the time period (time of compliance) over which the facility must be evaluated to ensure protection of the public and environment is 1,000 years following facility capping.

The contaminant leaching analysis used to model contaminant migration potential for a potential OSDC requires several predictions, which include the following:

- Infiltration of water from precipitation into a potential OSDC

- Leaching of contaminants from the waste disposed within a potential OSDC as a result of infiltration and downward migration through the unsaturated geologic strata beneath the facility (vadose zone) into the underlying groundwater zone

- Transport of contamination in groundwater beneath a potential OSDC to the receptor well and discharge to surface water bodies.

Five POAs and one POC were assessed. Modeling indicated that only five radionuclides and four inorganic constituents are predicted to migrate to the closest POA (POA-2), although at very low concentrations. No other COCs are modeled to reach the POAs within the 1,000-year compliance period. Given that the calculated numbers for the above constituents are either above their respective specific activities or higher than their respective physical concentration limits, coupled with the fact that the balance of the COCs are not predicted to reach any of the POAs within the 1,000-year compliance period and that the estimated radionuclide inventory for the waste destined for a potential OSDC at Study Area D is well below the modeled WAC, there effectively is no modeled limit for these constituents in waste when placed in a potential OSDC at Site D.

Based on input received from members of the public and other considerations, DOE and Ohio EPA have elected not to pursue on-Site disposal of the following waste streams in any future OSDC at PORTS:

- Converters, compressors and coolers from the X-326 Process Building

- Containerized nuclear material inventories of uranium compounds exhibiting enrichments greater than 20 percent (excludes items such as miscellaneous parts, pipes, valves, empty containers etc., with only residual contamination which were packaged for ease of handling and safety reasons).

While these streams are within the calculated values presented in this appendix, they are by agreement not being considered for on-Site disposal. With the elimination by agreement of the waste streams listed in the bullets above, use of a potential OSDC for the remaining waste materials present at PORTS would create a safety factor of at least five orders of magnitude, providing substantial added assurance that no human or ecological receptor would be impacted above established regulatory levels within the 1,000-year design horizon.

ATTACHMENT I.1: RADON CALCULATIONS

This page is intentionally left blank.

Radon calculations were performed using the equations and default parameters in *Radon Attenuation Handbook for Uranium Mill Tailings Cover Design* (NRC 1984) and the material property values from the on-Site disposal cell OSDC design (Geosyntec 2012).

Step 1: Radon flux from waste to base of cap at 1,000 years:

Jt = 10^4RρE(λDt)^0.5tanh((λ/Dt)^0.5*Xt)		
Jt = radon flux from the waste materials	calculate	pCi/m^2/s
R = specific activity of Ra-226 in the material	385	pCi/g
ρ = dry bulk density of the material	1.51	g/cm^3
E = radon emanation coefficient	0.2	dimensionless
Dt = radon diffusion coefficient	1.90E-02	cm^2/s
λ = decay constant for Rn-222	2.10E-06	1/s
Xt = thickness of material	1557	cm
Unit conversion from m^2 to cm^2	10,000	
Jt =	2.32E+02	pCi/m^2/s

Step 2: Values for material properties:

		Geosyntec reported values					Calculated values		
LAYER	layer#	x thickness cm	p porosity	MC moisture content	SG specifc gravity	Radon Diff Coef cm^2/s	m moisture saturation	a cm^2/s	b 1/cm
topsoil	8	15.2	0.398	0.15	2.80	7.66E-03	6.35E-01	3.41E-04	1.66E-02
vegetative soil	7	53.3	0.464	0.15	2.80	1.60E-02	4.85E-01	1.42E-03	1.15E-02
granular fill	6	15.2	0.437	0.08	2.65	3.25E-02	2.73E-01	3.95E-03	8.04E-03
biointrusion barrier	5	91.4	0.397	0.02	2.65	5.59E-02	8.05E-02	7.79E-03	6.13E-03
cover drainage	4	30.5	0.397	0.02	2.65	5.59E-02	8.05E-02	7.79E-03	6.13E-03
geomembrane	3	0.2	0.0001	0.0001	0.95	5.80E-08	--	--	--
Geosyn clay liner	2	0.6	0.750	0.25	2.80	3.64E-02	--	--	--
Compacted clay	1	61.0	0.401	0.17	2.80	4.50E-03	7.11E-01	1.62E-04	2.16E-02
impacted material	0	1557	0.453	0.13	2.76	1.90E-02	4.33E-01	1.80E-03	1.05E-02
CompClay+ImpMat		1618	0.427	0.15	2.78	8.38E-03	5.60E-01	5.25E-04	1.58E-02
			m = SG*MC/(p/(1-p))					a = p^2D(1-(1-k)m)^2	
			k =	0.26	@ 20C	NRC		b = (λ/D)^0.5	

Step 3: Radon flux above the compacted clay layer:

Jc = (2Jt*exp(-bc*xc))/(1+(at/ac)^0.5*tanh(bt*xt))+(1-(at/ac)^0.5*tanh(bt*xt))*exp(-2bc*xc)

Jc = radon flux at top of cover layer
ac = pc^2Dc(1-(1-k)mc)^2 at = pt^2Dt(1-(1-k)mt)^2
bc = (λ/Dc)^0.5 bt = (λ/Dt)^0.5
Dc = radon total diffusion coefficient for cover layer Dt = radon total diffusion coefficient for waste layer
Mc = moisture content (dry wt fraction) for cover layer Mt = moisture content (dry wt fraction) for waste layer
mc = fractional moisture saturation mt = fractional moisture saturation
pc = porosity of homogenous cover layer pt = porosity of waste layer
xc = thickness of homogenous cover layer xt = thickness of waste layer
k = radon distribution coefficient for water/air

Jc1 = 2.99E+01 pCi/m^2/s

Step 4: Calculate an equivalent source diffusion coefficient for the waste and compacted clay layer:

Dt1 = Dt*exp(-bc1*xc1) + Dc1*(1-exp(-bc1*xc1)) = 8.38E-03 cm^2/s

Step 5: Radon flux through cover drainage and biointrusion layer (NOTE: this is taken as the top of the cap, assuming geosynthetic clay liner and geomembrane have failed, and topsoil, vegetative soil and granular fill are removed by erosion):

Applying equation in Step 3 with the recalculated diffusion coefficient in Step 4:

Jc45 = 1.99E+01 pCi/m^2/s

APPENDIX J: ON-SITE DISPOSAL CELL CONCEPTUAL DESIGN FOR SITE D (ALTERNATIVE 2)

PREFACE

This appendix includes the methods used and results of three quantitative assessments, one to support evaluation of long-term effectiveness and two to support evaluation of short-term effectiveness of Alternatives 2 and 3. This appendix first discusses the potential impacts to surface water if a leachate collection and treatment system of a potential on-Site disposal cell that is part of Alternative 2 fails. It then presents the impacts of transportation accidents, based on the number of miles traveled transporting waste from and materials to the Portsmouth Gaseous Diffusion Plant, for both Alternatives 2 and 3 via truck and rail. Finally, it determines an estimate of the carbon emissions, based on total miles by truck or rail, from transporting waste and materials for each action alternative.

K.1 ON-SITE DISPOSAL CELL PASSIVE LEACHATE TREATMENT SYSTEM FAILURE

K.1.1 INTRODUCTION

An analysis was conducted to predict the potential concentrations of site-related contaminants (SRCs) at the Portsmouth Gaseous Diffusion Plant (PORTS) in the surface water resulting from failure of the passive leachate treatment system (PLTS). This system would be part of the potential on-Site disposal cell (OSDC) located in Site D, which is the representative location for such a facility if Alternative 2 is selected (see Appendix D of this report). For this evaluation, the potential OSDC is assumed to be a 3.9 million cy configuration.

The PLTS would be installed after the 30-year post-operations period when leachate generation rates are expected to be minimal. This system is conceptualized to consist of in-situ treatment media installed within the ditches cut into the shale for the original leachate conveyance lines. As the leachate moves through the treatment media, constituents are adsorbed onto the treatment media prior to water being discharged from the end of the PLTS. This system would treat the small volume of leachate anticipated to be generated in the future after facility capping. This system would remain in place with minimal, if any, maintenance.

The SRCs considered in this analysis include technetium-99, uranium-234, uranium-235, uranium-238, and trichloroethene (TCE). Uranium isotopes, technetium-99, and TCE are included in this quantitative analysis regarding failure of the PLTS since these are the primary contaminants of concern from process knowledge and would make up significant contaminant mass in the material that might be placed in a potential OSDC both from decontamination and decommissioning (D&D) activities (regulatory category [RC]-1) and from fill that may be contaminated (RC-2, RC-3). While other constituents would be present in the waste, uranium isotopes, technetium-99, and TCE represent those most likely to be in leachate for which treatment media would be targeted.

The potential failure of the PLTS could result from either ineffectiveness of treatment media that is part of the system allowing untreated leachate to be released to the surface or leachate bypassing the treatment media because of collection and transmission system failure, such as clogging, with leachate being released to the surface. In both failure scenarios, untreated leachate flows overground and enters a nearby water body.

This analysis does not take into account source depletion and therefore may overestimate leachate concentrations that might emanate from the PLTS under a failure scenario. It should be noted that long-term monitoring of this system as part of the overall environmental monitoring program would serve to identify potential failure conditions. This would allow corrections to be made before such conditions become irreversible. This uncertainty, as well as the fact that other constituents are not included in this analysis, is discussed in the uncertainties section below.

K.1.2 CALCULATION METHODS

The analysis was conducted following the steps described below.

1) Pathway and assessment point

   The pathway is the treated leachate discharge from the PTLS via gravity flow to the nearest surface water body located downgradient from the potential OSDC at Site D. Based on the conceptual design, the treated leachate would be discharged to the unnamed intermittent stream on the north side of PORTS, which drains into Little Beaver Creek. The assessment location for this analysis is a point in Little Beaver Creek, just west of the confluence of Little Beaver Creek and the northern unnamed drainage ditch. Figure K.1 shows the assessment point location. This location was selected because it is the closest surface water location that may receive effluent from the OSDC in Site D and because it is a location for which surface water flow data are available.

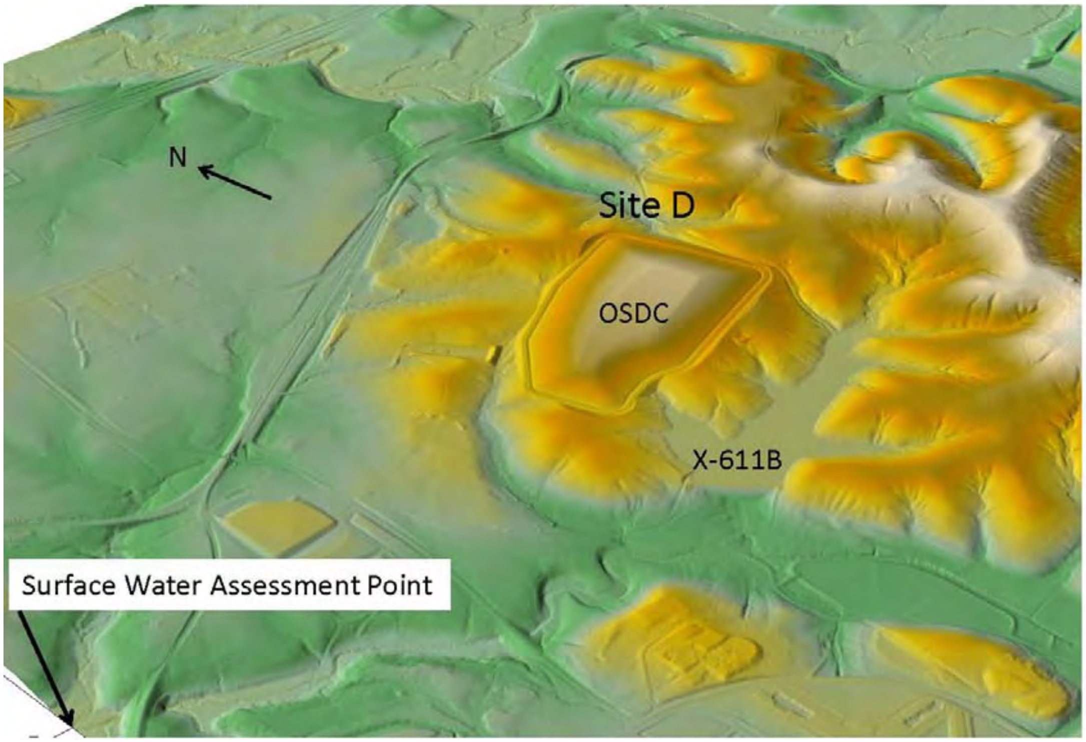

Figure K.1. Assessment Location

2) OSDC Source term determination

The source term for potential leachate emanating from a potential OSDC includes the contaminant activity (for radionuclides) or mass (for chemicals) within a potential OSDC. The concentrations of technetium-99 and uranium isotopes were calculated on the basis of total activity from nondestructive assay (NDA) measurements for converters in the X-326, X-330, and X-333 Process Buildings (uranium isotopes) and from process knowledge (technetium-99). The total activity in picocuries (pCi) is divided by the total waste mass to give an activity concentration (see Attachment K.1). For technetium-99 and uranium isotopes, a waste mass equivalent to a volume of approximately 112,000 cy of waste is assumed for disposal in a potential OSDC, which is the estimated volume of process gas equipment (PGE) (RC-1, engineering category [EC]-2) which contains the majority of the radiological contamination. The total curies from the NDA data is assumed to be dispersed throughout this volume, which is conservative since the PGE with the highest curie count would be disposed off Site. It should be noted that residual soil (RC-1, EC-1), and other non-D&D waste (RC-2, RC-4), as well as contaminated fill (RC-2, RC-3), may be disposed (see Section 4 for waste estimates) under Alternative 2. Technetium-99 and uranium isotope content is currently unknown in this additional waste volume, therefore no assumption is made regarding the level of radiological contamination in the balance of the waste volume (3.79 million cy) going to a potential OSDC.

However, this uncertainty is offset by the fact that the total curies within the PGE is assumed for the small volume, as discussed above. Table K.1 presents the calculation and results for technetium-99 and uranium isotopes waste source terms.

Table K.1. Calculation of Average Waste Concentrations in a Potential OSDC

Isotope	Total Activity (pCi)	Source
U-234	1.44×10^{13}	Source term from Attachment K.1, Page K.1-1
U-235	5.33×10^{11}	Source term from Attachment K.1, Page K.1-1
U-238	3.05×10^{12}	Source term from Attachment K.1, Page K.1-1
Tc-99	9.46×10^{13}	Source term from Attachment K.1, Page K.1-1
		Waste mass[1] 3.35×10^{11} g

Equation: Activity concentration = total activity (pCi)/waste mass (g)

pCi/g of Waste			
U-234	**U-235**	**U-238**	**Tc-99**
42.99	1.59	9.10	282.4

[1] Only the mass of the waste is assumed for this calculation

For TCE, the average concentration from the five groundwater plumes known to be present at PORTS was used to calculate the concentration in soil based on the partition coefficient (K_d) relationship. The calculated average soil concentration for TCE is 1.38 mg/kg. Table K.2 presents the calculation of the TCE soil source term. This information is from previous investigations and represents a cross section of known TCE groundwater contamination present at PORTS. Using the TCE soil concentration, the resultant OSDC waste concentration for TCE was calculated by multiplying the TCE soil concentration by the ratio of the contaminated fill (RC-2, RC-3) volume (1.49 million cy for impacted soil beneath landfills) anticipated to have TCE present and the total OSDC volume (approximately 3.9 million cy). Thus, the average OSDC waste concentration for TCE is 0.53 mg/kg.

Table K.2. Calculation of Average Waste Concentration of TCE in a Potential OSDC

Area	C_w (µg/L)	K_d (mL/g)	C_s (mg/kg)
Calculated Values C_s (mg/kg) = C_w (µg/L) × K_d (mL/g)/1000 µg/mg			
X-749/X-120/PK Landfill Plume	150	0.124	0.0186
Quadrant I GW Investigation Area Plume	250	0.124	0.031
Quadrant II GW Investigation Area Plume	2,500	0.124	0.31
X-740 Waste Oil Handling Facility Plume	150	0.124	0.0186
Measured Value			
X-701B GW Plume (post-treatment)			6.5
Average concentration in fill			1.38

Source: DOE 2011a

K_d was calculated on the basis of the organic carbon partition coefficient (K_{oc}) and fraction of organic carbon (F_{oc}) relationship where a literature value for K_{oc} of 60.7 mL/g and the site-specific F_{oc} (DOE 2009) of 0.00204 were used.

C_W = concentration in water
C_S = concentration in soil
DOE = U.S. Department of Energy
GW = groundwater
PK = Peter Kiewit

3) Maximum leachate water flux rate

The maximum water flux rate from a potential OSDC was calculated on the basis of a worst-case infiltration rate through the cover system. The Hydrologic Evaluation of Landfill Performance (HELP) model was used to predict the infiltration rate through the degraded cover system (geosynthetic clay liner layer is no longer functional). The calculated infiltration rate is 1.5 in./year that is consistent with a reasonable maximum infiltration rate associated with the precipitation, topography and likely future hydraulic parameters of a cap.

The maximum water flux out of the leachate system was then estimated on the basis of maximum waste areal footprint and an infiltration rate of 0.0193 cf/s as shown in Table K.3. It is assumed that all water moving through the waste would flow out of the PLTS and ultimately to the nearby drainage ditch.

4) Surface water flow rate and surface water dilution factor

The surface water flow rate was determined by using the U.S. Geological Survey study conducted between 1990 and 1991 at Little Beaver Creek. The collected 15-minute interval data were used to determine the yearly flow rate change. The highest flow rate is 735 cf/s, and the lowest one is 0.65 cf/s. The current average flow rate is 6.07 cf/s for the data set (a total of 21,781 measurements). Much of this flow is related to discharges from the plant through National Pollutant Discharge Elimination System permitted discharge locations. However, after capping, these discharges are expected to be eliminated, thus reducing the flow conditions by approximately 1.38 cf/s. Therefore, for future flow conditions, the total estimated flow rate for all discharges into Little Beaver Creek is subtracted from the current flow rate to approximate a future condition creek flow rate of 4.69 cf/s. Table K.3 presents the input parameters and the calculation of the future condition flow rate. The average future surface water flow rate was used to estimate the surface water dilution factor. The surface water dilution factor is the ratio of water flux between the creek at the assessment point (4.69 cf/s) and the maximum water flux from the PLTS (0.0193 cf/s). The future condition surface water dilution factor (243.01) is shown in Table K.3.

Table K.3. Input and Calculation of Future Condition Flow Rate

Element	Unit	Value	Data Source
Width (W)	ft	1,600	Conceptual Design, see Section 8
Length (L)	ft	3,050	Conceptual Design, see Section 8
Infiltration Rate through Cover (IR)	in./year	1.5	HELP Model
Leachate Generated (L×W×IR)/12 in./ft	cf/year	610,000	Estimated using HELP Model
	cf/s	0.0193	Calculated
Current Flow Rate @ Little Beaver Creek	cf/s	6.07	Based on USGS report
Outfall Discharge (total)[1]	cf/s	1.38	Calculated
Future Condition Flow Rate @ Little Beaver Creek	cf/s	4.69	Calculated by removing outfall discharge
Future Condition Surface Water Dilution Factor		243.01	Calculated without outfall discharges

[1] Using average flow rates from 2009 Q1-Q3 data.

HELP = Hydrologic Evaluation of Landfill Performance
USGS = U.S. Geological Survey

5) Maximum leachate concentration

The maximum leachate concentrations were calculated on the basis of equilibrium relationship (K_d) using the average activity concentrations or concentration from Step 2. The K_d values for technetium-99 and uranium isotopes were obtained from site-specific measurements. A lower value of 14.2 mL/g is used for the uranium isotopes, and a value of 3.79 mL/g is used for technetium-99. The K_d for TCE was calculated on the basis of the organic carbon partition coefficient (K_{oc}) and fraction of organic carbon (F_{oc}) relationship where the site-specific F_{oc} data were used. A literature value for K_{oc} (U.S. Department of Energy [DOE]-Risk Assessment Information System) was used. The K_d for TCE is calculated to be 0.124 mL/g. Table K.4 presents the maximum leachate concentrations for the SRCs arrived by dividing the average concentration in OSDC waste by the K_d value.

6) Concentration in surface water

The concentrations of contaminants in the surface water were then calculated using the dilution factor. The maximum leachate concentrations of SRCs from Step 5 are divided by the surface water dilution factor calculated in Step 4. Table K.4 presents the surface water concentrations for the SRCs.

Table K.4. Maximum Leachate and Surface Water Concentrations

	Tc-99	**U-234**	**U-235**	**U-238**	**TCE**
Average Concentration in OSDC Waste/Fill	8.11 pCi/g	1.23 pCi/g	0.046 pCi/g	0.26 pCi/g	0.53 mg/kg
K_d (mL/g)	3.79	14.2	14.2	14.2	0.124
Maximum Leachate Concentration	2,140 pCi/L	86.6 pCi/L	3.2 pCi/L	18.3 pCi/L	4.3 mg/L
Surface Water Concentration	8.81 pCi/L	0.36 pCi/L	0.013 pCi/L	0.075 pCi/L	17.7 µg/L
Risk-based Standard[1]	3,030pCi/L	118 pCi/L	120 pCi/L	130 pCi/L	410 µg/L

[1] Source for Tc-99, U-234, U-235, and U-238 - PORTS SL Calculator; for TCE - DOE 2011b, Type 2 SL

OSDC = on-Site disposal cell
SL = screening level
TCE = trichloroethene

K.1.3 RESULTS

According to this analysis, the concentrations of the SRCs modeled to be discharged from the inoperable PLTS at the assessment point in Little Beaver Creek are extremely low. The modeled concentrations are compared to risk-based surface water concentrations assuming a recreational receptor (teen) for a risk of 10^{-6} as follows:

- Uranium-234 – 118 pCi/L
- Uranium-235 – 120 pCi/L
- Uranium-238 – 130 pCi/L
- Technetium-99 – 3,030 pCi/L
- TCE – 410 mg/L.

These risk-based surface water concentrations are from the PORTS Screening Level Calculator (for radionuclides) (DOE 2012) or from Table 2 in *Methods for Conducting Human Health Risk Assessments and Risk Evaluations at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (DOE 2011b).

The modeled SRC surface water concentrations are well below their respective risk-based surface water concentrations. Note that this analysis does not take into account expected volatilization of TCE, which would result in an even lower concentration than that modeled in this analysis.

Based on the results of this analysis, potential failure of the PLTS with discharge of untreated leachate into surface water would not result in unacceptable impacts to human health.

K.1.4 UNCERTAINTIES

The analysis performed for a scenario in which the PLTS fails resulting in the release of untreated leachate from a potential OSDC at Site D to nearby surface water has uncertainties. First, the analysis is limited to uranium isotopes, technetium-99, and TCE. As previously stated, these represent constituents most likely to be present in leachate, due to their relatively low K_d values. While other constituents may be present, such constituents have higher K_d values than those associated with the constituents included in this analysis and are expected to have even less impact on surface water quality. Therefore this uncertainty does not have a large impact to the conclusions.

A larger source of uncertainty in this analysis is associated with the source terms for the uranium isotopes and technetium-99. As noted in Attachment K.1, the total activities of the uranium isotopes are calculated using NDA measurements. Measurements made by NDA can have significant uncertainty and the PORTS historical results can be biased high by a factor of 2 or more. However, as noted in the results presented, using the NDA measurements results in surface water concentrations that are well below the risk-based concentrations for protection of human health. Therefore, this uncertainty does not have a large impact to the results. Further, the total activity of technetium-99 is calculated assuming the mass of remaining source based on process knowledge. While the process knowledge regarding technetium-99 remaining in the PGE is reasonable, the activity could be underestimated. Process knowledge has been supported by a calculation of total mass of technetium-99 in the process equipment using the existing analytical data. This data is not yet considered representative of the process equipment and therefore was not used in this analysis, however, an estimation of total mass in the process equipment using this data is 5.5 kg. Other sources of information suggest the mass of technetium-99 could be as high as 35 kg. It should be noted that the source term calculations for uranium-234, uranium-235, uranium-238 and technetium-99 in a potential OSDC do not take into account the volume of uncontaminated soil fill (EC-1) that may be co-disposed with waste requiring fill (EC-2). Further, the additional waste mass associated with other waste that may be generated outside *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) and the Ohio Consent Decree (RC-4), as well as other soil waste generated under the Ohio Consent Decree (RC-2), is not considered in determining the waste source terms for uranium isotopes, technetium-99, and TCE. This additional mass would dilute the activity concentrations of these radionuclides, thus reducing the actual activity concentrations in the leachate. Finally, it is assumed that the PGE has 50 percent void space, thus the density is reduced by 50 percent. This assumption increases the activity concentration slightly as a result. Further reducing the waste density, if warranted, would increase the activity concentrations and thus increase the resultant concentrations in the surface water. However, because the surface water concentrations are well below the risk-based concentrations, this uncertainty has little impact to the results. These data uncertainties notwithstanding, this approach provides a reasonable estimate of the source terms for leachate concentrations and resultant surface water concentrations, which are well below the risk-based concentrations.

The K_d values used for the constituents are a source of uncertainty in this analysis. While the values used for the uranium isotopes and technetium-99 are from laboratory analysis performed using various soil types from PORTS, they could be underestimated for actual waste materials. Therefore, the activity concentrations leached may be overestimated, resulting in concentrations in the stream to be estimated higher than they are. Conversely, a change to the chemistry within a potential OSDC during its lifecycle may lead to an increase in the K_d values assumed in this analysis over time. This uncertainty may result in a decrease in the potential release of contaminants from the waste mass and therefore a decrease in concentration/activity of contaminants in the leachate. However, these uncertainties have little impact to the results.

As noted in Table K.3, a prediction of the likely future flow condition in Little Beaver Creek is made after current discharges from the plant cease. While the prediction is based on actual measurements of the plant discharges and base flow of Little Beaver Creek, should the actual flow rate be lower than that predicted, the result would be higher stream concentrations of all constituents included in this analysis. Likewise, if the actual flow is higher, the resultant concentration would be lower. Because the resultant concentrations are orders of magnitude less than the risk-based concentrations, this uncertainty does not have a large impact to the results.

The source term for TCE has a large uncertainty, as the basis for the estimate is from concentrations of known groundwater plumes with the waste concentration back-calculated on the basis of the K_d for TCE. This calculation could underestimate the concentration of TCE in the waste placed in a potential OSDC. If the concentration calculated for this analysis is low by orders of magnitude (from that actually present), the resultant surface water concentration would still not exceed the risk-based concentration. Additionally, as previously stated, the analysis does not consider source depletion. TCE has a half-life through microbial degradation that ranges from approximately 9 years to 28 years, therefore concentrations expected in the waste would be lower, by as much as 50 - 75 percent lower, offsetting any underestimation. Further, as previously discussed, a change in the chemistry within a potential OSDC could lead to an increase to the K_d values for TCE and degradation products. This would result in a decrease in the potential mass released and thus a decrease in the concentrations of TCE and degradation products in the leachate. The uncertainty of the TCE source term is high but because there are both underestimating and overestimating uncertainties, the likely impact to the results of this analysis is low.

Given the uncertainties discussed above, the analysis of a potential failure of the PLTS is reasonable. To avoid this failure, significant effort during the engineering design of this system would be applied in selecting treatment media and in designing the long-term conveyance of the anticipated low volumes of leachate that would emanate from the closed OSDC. Further, to lessen the impact of a failure of the PLTS, periodic monitoring of the system, as part of the overall environmental monitoring program, would occur such that issues would be identified early and corrected as necessary.

K.2 TRANSPORTATION RISK ANALYSIS

K.2.1 INTRODUCTION

There is an inherent risk of accidents in transporting materials by various modes of transport via trucks along public roads and by commercial rail. The U.S. Department of Transportation (DOT) keeps track of accident rate statistics for vehicle traffic. Additionally, numerous studies have compiled statistics related to rail transport. These statistical data are reported in the form of an injury rate per vehicle miles traveled and fatality rate per vehicle miles traveled for both large truck and rail transportation. This analysis supports the short-term effectiveness evaluation performed in the feasibility study (FS). Total miles for transport of waste from the D&D of PORTS for Alternatives 2 and 3 and for construction materials for facilities and infrastructure for Alternative 2 are estimated and then multiplied by the accident rates to arrive at the numbers of injuries and fatalities that may occur based on these miles. Only those miles associated with transportation off Site that interacts with the public are included in this analysis.

Calculation of transportation risk for the action alternatives requires analyzing shipments of waste, fill material, and construction materials, as well as considering mode of transportation (in other words, truck vs. rail), and miles to and from the destination. The following sections describe and quantify each element of the transportation risk for Alternative 2 and Alternative 3.

K.2.2 WASTE MATERIAL VOLUMES

Table K.5 presents all the waste forms (RC-1) and volumes assumed for each alternative. This table is built off of the table first introduced in Section 4.1, but it is expanded to include the disposition paths for each alternative as well as transported volumes that will be used in this analysis. The alternatives included in the FS, Alternative 2 (on-Site) and Alternative 3 (off-Site) disposal, consist of five major waste disposition assumptions/approaches driven primarily by the expected PORTS waste forms and volumes discussed and illustrated in Section 4.1. Each of these alternatives considers the DFF&O D&D waste volume (RC-1) using the following assumptions:

1) The PGE, assumed to be nearly all low-level (radioactive) waste (LLW), would be shipped off Site to the DOE Nevada National Security Site (NNSS) in Nevada near Mercury, Nevada or to a potential OSDC. Under Alternative 2 it is assumed that 53,000 in-place cy of PGE, primarily from the X-326 Building, would be shipped to NNSS with the remainder going to a potential OSDC. Under Alternative 3, 272,000 in-place cy of PGE would be shipped to NNSS.

2) Metal with a high probability for recycle and/or reuse would be stored on Site to wait processing. The volume estimate of 110,000 cy is the same for each alternative. This material is not included in the transportation risk calculations.

3) Although waste acceptance criteria (WAC) for the potential OSDC have not been fully developed, a waste disposition planning assumption is that approximately 30,000 cy of waste would exceed the OSDC WAC and thus would require off-Site disposal at a commercial disposal facility (Energy*Solutions* in Clive, Utah) for Alternative 2.

4) Solid waste and construction and demolition debris are assumed to be disposed locally at Pike Sanitation Landfill located in Pike County, Ohio. For Alternative 2 it is assumed that 38,800 cy of waste would be disposed at this industrial landfill while for Alternative 3, 240,000 cy are assumed to be disposed.

5) The balance of LLW and mixed LLW generated by DFF&O actions (RC-1) at PORTS would be shipped to a potential OSDC under the on-Site alternative or the Energy*Solutions* disposal facility in Clive, Utah, under the off-Site alternative. The volume to a potential OSDC in Alternative 2 is assumed to be 1,354,000 cy, while that disposed at Energy*Solutions* in Alternative 3 is assumed to be 845,000 cy.

Table K.5. Site-wide Waste Disposition Volumes

D&D Waste and OSDC Fill Description	In situ volume	Disposed Volume in OSDC in Alternative 2	Transported Off Site in Alternative 2[1]	Disposed Off Site in Alternative 2	Volume Transported Off Site in Alternative 3[1]	Disposed Off Site in Alternative 3
Residual Soil Removed with Buildings (RC-1, EC-1)	53,000 cy	53,000 cy	0	0	64,000 cy	53,000 cy
Other Building Waste (RC-1, EC-2)	1,032,000 cy	967,000 cy	82,000 cy (in situ 65,000 cy)	65,000 cy	1,214,000 cy	1,032,000 cy
PGE	272,000 cy	112,000 cy[2] (in situ 219,000 cy)	44,000 cy[2] (in situ 53,000 cy)	41,000 cy[2] (in situ 53,000 cy)	99,000 cy[2] (in situ 272,000 cy)	99,000 cy[2] (in situ 272,000 cy)
Targeted Recyclable Material	110,000 cy	0	Location unknown so not included in transportation calculations	110,000 cy recycled	Location unknown so not included in transportation calculations	110,000 cy recycled
Total D&D Waste and Recyclables (RC-1)	**1,467,000 cy**	**1,132,000 cy** **(in situ 1,239,000 cy)**	**NA**	**216,000 cy** **(in situ 228,000 cy)**	**NA**	**1,294,000 cy** **(in situ 1,467,000 cy)**
Non-D&D Landfill Waste Requiring Fill (RC-3, EC-2) (as a result of using area as OSDC fill source)	227,000 cy	223,000 cy	5,000 cy (in situ 4,000 cy)	4,000 cy	0	0
Total D&D and Fill Waste Requiring Fill (EC-2)	**NA**	**1,301,000 cy** (in situ 1,462,000 cy) (does not include 53,000 cy of residual soil)[3]	**NA**	**220,000 cy** **(in situ 232,000 cy)**	**NA**	**1,294,000 cy** **(in situ 1,467,000 cy)**
OSDC Fill Required to Achieve 2:1 ratio[4]	NA	2,602,000 cy	NA	NA	NA	NA
Total OSDC Minimum Capacity Required	NA	3,900,000 cy	NA	NA	NA	NA

[1] Transported volumes are typically greater for a waste stream than in situ volumes due to bulking that occurs during excavation or demolition. The material is typically compacted again once disposed.

[2] Much of the PGE is segmented, resulting in a volume reduction for transportation and disposal. Greater volume reduction is conducted for off-Site disposal to lower costs.

[3] Rounding does not allow for numbers to add exactly.

[4] From residual soil (RC-1, EC-1), groundwater plumes (RC-2, EC-1), landfills (RC-3, EC-1), and RCRA deferred units (RC-2, EC-1).

D&D = decontamination and decommissioning
EC = engineering category
NA = not applicable or not available
OSDC = on-Site disposal cell
PGE = process gas equipment
RC = regulatory category
RCRA = Resource Conservation and Recovery Act of 1976 (as amended)

Most waste would be shipped by truck to the potential OSDC under Alternative 2 or in bulk, by rail, to Energy*Solutions* under Alternative 3. Rail transportation of large quantities of waste is generally much less expensive and more efficient, avoiding many millions of potential truck miles from PORTS to Energy*Solutions*. However, mileage calculations and subsequent discussions of risk assume some truck transport to NNSS (which cannot receive waste by rail).

All the named "representative" facilities have sufficient disposal capacity to receive the projected waste volumes. Table K.6 summarizes the in-place volume and disposal location assumptions for Alternative 2 and Alternative 3.

Table K.6. Alternatives 2 and 3 Disposition Plans

	In-Place Waste Disposal Volumes by Destination (million cy)					
Alternative	**NNSS, Nevada**	**Pike Sanitation Landfill**	**Recycle/Reuse**	**Energy*Solutions*, Clive, Utah**	**OSDC**	**Totals**
2	0.053	0.039	0.11	0.030	1.35	1.59
3	0.27	0.24	0.11	0.845	NA	1.47

NA = not applicable
NNSS = Nevada National Security Site
OSDC = on-Site disposal cell

K.2.3 TRANSPORTATION MILES

The total truck or rail miles are then calculated assuming a certain volume shipped per truck or train. The miles for the various activities (disposal or obtaining materials) are summarized below. The in-place volumes that have been assumed in the FS for disposal have been modified to transported volumes. The factors used to modify in-place volumes to transported volumes vary by waste stream, based on mode of transport, shipment containers required for transport, and any limitations associated with the transport mode.

K.2.3.1 Transportation of PORTS Waste to Energy*Solutions*, Clive, Utah, by Rail

Table K.7 summarizes the total railcar miles to deliver waste from PORTS to the Energy*Solutions* facility, located approximately 80 miles west of Salt Lake City, Utah, by rail under Alternative 2 and Alternative 3. Under Alternative 2, 36,700 transported cy of waste are assumed to be greater than the expected OSDC WAC and thus require disposal at the Energy*Solutions* facility. Under Alternative 3, 966,600 transported cy of waste requires shipment and disposal at the Energy*Solutions* facility.

A key assumption is that an average of 70 cy of expanded volume of waste (including packaging space) would be transported by railcar. Likewise, 55 railcars are assumed to be transported as one train. The Energy*Solutions* facility is estimated to be 1,820 rail miles from PORTS. Because it is assumed that the railcars are to be dedicated to PORTS throughout the shipment campaigns, the railcar miles are doubled to account for the return trip (i.e., 3,640 miles). The metric used in this analysis for rail shipments is railcar miles, since the accident statistics are maintained in this manner.

Table K.7. Rail Shipments from PORTS to Energy*Solutions*, Clive, Utah

Alternative	Transported Volume (cy)[1]	Number of Railcars	Number of Railcar Miles (miles)[2]
2	36,700	515	1,875,000
3	966,600	13,715	49,923,000

[1]Transported volume is in-place volume expanded by varying amounts depending on the material and type of package
[2]Assumes 3,640 miles round trip

K.2.3.2 Transportation of Waste to Pike Sanitation Landfill (Alternatives 2 and 3)

Table K.8 summarizes the total waste volumes and truck miles to dispose of PORTS-generated waste at the Pike Sanitation Landfill in Pike County, Ohio, for Alternatives 2 and 3. This landfill only accepts industrial/solid waste and does not accept waste that must be managed for its radioactive or hazardous waste content. Under Alternative 2, 50,400 cy would be shipped and disposed, while under Alternative 3 312,000 cy would be shipped and disposed. Trucks are assumed to make a round trip of 15 miles.

Table K.8. Waste Volumes and Truck Miles to Pike Sanitation Landfill

Alternative	Transported Volume (cy)[1]	Number of Truck Trips[2]	Number of Truck Miles (miles)[3]
2	50,300	2,518	38,000
3	312,000	15,579	234,000

[1]Transported volume is in-place volume expanded by 30 percent
[2]Assumes 20 cy per truck
[3]Assumes 15 miles per round trip for each truck shipment

K.2.3.3 Transportation of PORTS Waste to the NNSS

Table K.9 summarizes the total truck miles to deliver PORTS waste to the NNSS disposal facility located approximately 90 miles northwest of Las Vegas, Nevada. Under Alternative 2, 44,000 cy of PGE waste is assumed to be shipped and disposed at NNSS via truck.

Under Alternative 3, 99,000 cy of PGE waste is assumed to be shipped to NNSS via truck. This volume assumes significant volume reduction from segmenting all PGE in the three process buildings (X-326, X-330, and X-333) at PORTS. Trucks traveling west are assumed to make a round trip of 4,400 miles.

Table K.9. Waste Volumes and Truck Miles for PORTS Waste Shipped to NNSS

Alternative	Transported Volume (cy)[1]	Number of Truck Trips	Number of Truck Miles (miles)[2]
2	44,000	4,969	21,863,600
3	99,000	9,727	42,798,800

[1]Transported volume is volume after segmentation
[2]Assumes 4,400 miles per round trip from PORTS to DOE NNSS disposal area

DOE = U.S. Department of Energy
PORTS = Portsmouth Gaseous Diffusion Plant
NNSS = Nevada National Security Site

K.2.3.4 Construction Materials for OSDC (Alternative 2)

Under Alternative 2, a variety of construction materials would be sent to PORTS from various vendors and/or sources. Table K.10 summarizes the total truck miles necessary to provide OSDC construction materials such as clay, liners, piping, fencing, etc., for a disposal facility with a 3.56 million cy capacity and associated infrastructure. The specific assumptions for the delivery of each material are presented in the footnotes below the table.

Table K.10. Waste Volumes and Truck Miles for Construction Materials (Alternative 2)

Gravel/Rock [1]		Leachate Piping[2]		Liners[3]		Fencing[4]		Total Miles
(cy)	(mi)	(lf)	(mi)	(yd^2)	(mi)	(lf)	(mi)	(mi)
1,257,000	1,047,000	46,000	5,700	3,354,000	2,236,000	30,000	2,000	3,291,000

[1] Assumes 12 cy per truck, 10 miles round trip
[2] Assumes 20-ft sections of pipe, 40 pieces per shipment, 100 miles round trip
[3] Assumes liner material is 9 ft wide rolled in 25 yd sections, 4 75 sq yd rolls per truck, 200 miles round trip
[4] Assumes 8-ft-wide fence rolled into 100-ft sections, 8 bundles per truck, 50 miles round trip

For construction of a potential OSDC at Site D a significant volume of soil and bedrock would be excavated. This site preparation scope would not contribute to transportation risk because the trucks and equipment operate solely on Site. These materials would be staged within the OSDC work area for later use as fill.

K.2.3.5 Transportation Miles Summary

Table K.11 summarizes the truck and rail miles for primary transport segments associated with Alternatives 2 and 3.

Table K.11. Summary of Truck and Rail Miles for Each Primary Segment of Alternatives 2 and 3

Alternative	Construction Materials for Potential OSDC (miles)	Railcars to Clive, UT (miles)	Truck to Pike Sanitation Landfill (miles)	Truck to NNSS (miles)
2	3,291,000	1,875,000	38,000	21,864,000
3	NA	49,923,000	234,000	42,799,000

NA = not applicable
NNSS = Nevada National Security Site
OSDC = on-Site disposal cell

Table K.12 summarizes the total truck and rail miles for Alternatives 2 and 3. Alternative 3 has more truck miles because of the larger volume of PGE waste being shipped to NNSS. Similarly, the railcar mile totals under Alternative 3 are much greater than for Alternative 2 because of the large quantities of waste required to be shipped by rail to the representative commercial disposal facility in Clive, Utah.

Table K.12. Total Truck and Railcar Miles by Alternative

Alternative	Total Truck Miles	Total Railcar Miles
2	25,192,000	1,825,000
3	43,032,000	49,923,000

K.2.4 CALCULATION OF INJURIES AND FATALITIES ASSOCIATED WITH TRANSPORTATION OF MATERIALS AND WASTE

To calculate total risk (injury and fatality) from transporting materials and waste during implementation of the alternatives, the total miles traveled by a given mode of transportation is multiplied by the associated rate using the following equation:

Truck Miles Traveled or Railcar Miles × Risk Rate = Total Injuries/Fatalities

Table K.13 presents the injury and facility risk rates per mile traveled by trucks or railcars.

Table K.13. Transportation Risk Rates

Transportation Method	Western Route Injury Rate[1]	Western Route Fatality Rate[2]	Ohio Injury Rate[1]	Ohio Fatality Rate[2]
Large Truck[3]	3.71×10^{-7}	2.14×10^{-8}	1.72×10^{-7}	6.28×10^{-9}
Railcar[4]	5.60×10^{-8}	3.03×10^{-8}		

[1] Injuries per truck mile or injuries per railcar mile
[2] Fatalities per truck mile or fatalities per railcar mile
[3] Tables 6.38 and 6.39 in DOE 2002
[4] Tables 6.40 in DOE 2002

DOE = U.S. Department of Energy

A western truck route from Piketon, Ohio to NNSS near Mercury, Nevada is assumed to traverse the following states: Ohio, Indiana, Illinois, Missouri, Kansas, Colorado, Utah, and Nevada. Therefore, the injury and fatality rates for trucks for these states were used to calculate average rates for this truck route. Similarly, a western rail route from Piketon to Energy*Solutions* near Clive, Utah is assumed to traverse the following states: Ohio, Indiana, Illinois, Missouri, Kansas, Colorado, and Utah. Therefore, the injury and fatality rates for railcars for these states were used to calculate average rates for this rail route. Finally, for transportation assumed to occur solely within the state of Ohio, only the injury and fatality rates for Ohio were used in the calculations.

Risks were calculated by using the total truck miles and railcar miles from Table K.12. Table K.14 presents the total injuries and fatalities expected, based on total transportation miles and using the injury and fatality rates from Table K.13.

Table K.14. Transportation Risk Summary for Alternatives 2 and 3

Destination	Alternative 2	Alternative 3
Waste to Energy*Solutions*, Clive, UT: Rail	0.1	2.8
Waste to NNSS, Mercury, NV: Truck	8.1	15.9
Waste to Pike Sanitation Landfill, Piketon, OH: Truck	0.006	0.04
Construction Materials to OSDC: Truck	0.6	NA
Total Injuries	**8.8**	**18.7**
Waste to Energy*Solutions*, Clive, UT: Rail	0.06	1.5
Waste to NNSS, Mercury, NV: Truck	0.5	0.9
Waste to Pike Sanitation Landfill, Piketon, OH: Truck	0.0002	0.001
Construction Materials to OSDC: Truck	0.02	NA
Total Fatalities	**0.6**	**2.4**

NNSS = Nevada National Security Site
OSDC = on-Site disposal cell

As indicated by the total number of injuries and fatalities summed across the individual transportation segments, shipping waste off Site under Alternative 3 results in more injuries and fatalities than the on-Site waste disposal alternative (Alternative 2). Alternative 3 transportation of waste results in nearly 2 times more truck miles and 27 times more railcar miles than Alternative 2. Thus, the total expected injuries for Alternative 3 are 18.7 while the expected fatalities are 2.4 versus 8.8 and 0.6, respectively, for Alternative 2.

K.2.5 IMPACTS OF OFF-SITE DISPOSAL OF INCREASING WASTE VOLUMES

Increasing waste volumes to include material associated with Ohio Consent Decree (RC-2) actions or other waste generated would result in an increase in waste volume requiring off-Site disposal under Alternative 3, therefore increasing transportation risk. If the waste volumes increase by an in-place volume of 710,000 cy, the transported volume would have an increase of approximately 802,000 cy. Assuming this material is sent via rail for treatment and disposal at Energy*Solutions*, rail transportation risks would increase. Using the calculation method described above, total railcar miles under Alternative 3 would increase to 97,836,000. The resultant rail transportation risks would increase in rail injuries to 5.5 (versus 2.8) and increase in rail fatalities to 2.96 (versus 1.51) for net total injuries of 21.4 and net total fatalities of 3.9 for off-Site disposal.

K.3 GREENHOUSE GAS IMPACTS FROM TRANSPORTATION OF WASTE FROM PORTS

One of the major components of greenhouse gases (GHGs) comes from the combustion of fossil fuels. Carbon dioxide (CO_2) emissions account for 94 to 95 percent of the GHGs emitted by the transportation sector. The U.S. Environmental Protection Agency (EPA) uses CO_2 emission estimates as a representative indicator of all GHG emissions. GHG emissions are a function of energy consumed. According to EPA, 22.2 lb of CO_2 are generated for every gallon of diesel fuel burned (EPA 2005). The equation for determining GHG emissions is as follows:

$$EM = FC \times EF$$

where:

EM = Emissions of carbon dioxide (expressed as tons of carbon dioxide equivalents)
FC = Fuel (energy) consumed during transportation (gallons of diesel fuel)
EF = Emission conversion factor for diesel fuel

The total truck miles associated with Alternative 2 and Alternative 3, include both transportation of construction materials and waste from Table K.11. Additionally, the total miles for on-Site movement of waste from trucks shipping waste to a potential OSDC under Alternative 2 and from on-Site movement of waste to an on-Site rail siding for rail shipments under Alternatives 2 and 3 was included. Tables K.15 and K.16 summarize the miles calculated for the added on-Site waste shipments. Table K.17 presents the truck miles associated with bringing fill to a potential OSDC during operation.

Table K.15. Alternative 2 On-Site Waste Volumes and Related Truck Miles

In-Place Volume (cy)	Transported Volume (cy)[1]	Number of Truck Trips[2]	Number of Truck Miles (miles)[3]
1,354,000	1,563,400	93,400	374,000

[1] Transported volume is in-place volume expanded by 15 percent
[2] Assumes 16.74 cy per truck
[3] Assumes an average of 4 miles per round trip for each truck shipment

Table K.16. Intra-Site Truck Shipments of Waste to the PORTS Rail Siding

Alternative	Transported Volume (cy)[1]	Number of Truck Trips[2]	Number of Truck Miles (miles)[3]
2	36,700	1,668	6,700
3	966,600	96,660	387,000

[1] Transported volume is in-place volume expanded by various amounts depending on material and packaging
[2] Assumes 22 cy per truck
[3] Assumes an average of 4 miles per round trip from point of generation to the PORTS rail siding

PORTS = Portsmouth Gaseous Diffusion Plant

Table K.17. Alternative 2 On-PORTS Fill Volumes and Related Truck Miles

In-Place Volume (cy)	Transported Volume (cy)[1]	Number of Truck Trips[2]	Number of Truck Miles (miles)[3]
2,549,000	3,059,000	182,700	731,000

[1] Transported volume is in-place volume expanded by 20 percent
[2] Assumes 22 cy per truck
[3] Assumes an average of 4 miles per round trip for each truck shipment

To assess CO_2 emissions, the railcar miles need to be translated into train miles. The railcar miles are divided by 55 railcars per train. The GHG emissions are calculated by first dividing total miles by an average miles per gallon value estimated for the given transportation mode, then summing to give a total diesel fuel consumption by alternative volume scenario. Table K.18 presents the total gallons of fuel expected to be used for truck transportation and rail transportation for each alternative.

Table K.18. Estimated Diesel Fuel Consumption by Transportation Mode

Alternative	Total Truck Miles	Truck Fuel Consumption[1] (gal)	Total Train[2] Miles	Train Fuel Consumption[3] (gal)	Total Diesel Fuel Consumption (gal)
2	26,303,000	4,871,000	33,000	6,500	4,877,500
3	43,419,000	8,040,600	906,000	180,000	8,220,400

[1] DOT 2008, Highway Statistics (1995-2008), Federal Highway Administration – 5.4 mpg
[2] Total railcar miles divided by the total number of railcars per train required for shipment of waste
[3] DOT 2009, Comparative Evaluation of Rail and Truck Fuel Efficiency on Competitive Corridors – 5.04 mpg

DOT = U.S. Department of Transportation

Next, the expected total GHG emissions associated with transportation aspects of the alternatives analyzed for the Site-wide waste disposition FS are calculated by dividing the total gallons of diesel fuel consumed by the CO_2 emission rate per gallon presented above. Table K.19 presents the CO_2 emissions for Alternatives 2 and 3.

Table K.19. CO_2 Emissions by Alternative

Alternative	Total Diesel Fuel Consumption (gal)	CO_2 Emissions (tons)
2	4,877,500	54,140
3	8,220,400	91,250

According to these results, Alternative 3 has a higher GHG impact as compared to Alternative 2. Specifically, Alternative 3 results in over 1.7 times more diesel fuel consumed and GHG emissions than Alternative 2.

ATTACHMENT K.1: CALCULATION OF URANIUM AND TECHNETIUM ACTIVITY IN PROCESS GAS SYSTEM BUILDINGS

Calculation of uranium and technetium activity in Process Gas Equipment (PGE).

Assumptions:

1. PGE contamination is in X-330, X-333, and X-326 converters.
2. All uranium is contained in PGE (conservative); actual percentage is likely between 85 and 95%.
3. In situ NDA measurements are conservative by a significant factor (perhaps as much as 100%).
4. X-333 converter in situ NDA is from neutron measurements and is very conservative. A correction factor (28) determined from neutron and gamma NDA measurements is used to adjust maximum U-235 measurements.

References:

NDA Data from "NDA - Spetnagel - Complete_cell_data_with_caretaker_051111" spreadsheet (X-333 Adjusted by factor of 28).
Barrier Weights from" Spetnagel - PORTS_PROCESS_MATERIAL_INVENTORY_040711" document.

Tc-99 Activity:
5.5 kg of Tc-99 equals 5,500 g x 1.72E+10 pCi/g = 9.46E+13 pCi.

Tc-99

specific activity = 1.72E+10 pCi/g

9.46E+13	**pCi**	
9.46E+12	**pCi**	**10% of total activity**

2,340 = # of X-326 Converters
1,100 = # of X-330 Converters
640 = # of X-333 Converters

	U-234	**U-235**	**U-238**
total activity (pCi)	**1.44E+13**	**5.33E+11**	**3.05E+12**
10% of total activity (pCi)	**1.44E+12**	**5.33E+10**	**3.05E+11**

Note:

In determining the number of grams or curies of natural uranium isotopes (U-234, U-235, and U-238), the quantities were derived from historical NDA measurements on the process equipment at PORTS. This involved using the documented U-235 to U-234 ratio, the documented cell uranium assay (U-235 percentage), and the maximum number of U-235 grams reported by NDA measurement. One adjustment was made to this data. Based on the ratio of NDA results in the X-330 converters between neutron and gamma NDA measurements, the neutron measurements for converters (only) in X-333 were adjusted to reflect this ratio, based on the determination that the converter gamma measurements in X-330 were more respresentative than the neutron measurements (see column labled "Max U235 Gms X-333 Adjusted"). Since gamma measurements were not performed in X-333, it was decided to use this adjustment factor. It should be noted that a similar bias likely exists for the X-333 compressors and coolers, but no relationship has been established to adjust the measurements for this equipment.

Convert 10% of total activity to grams = activity (pCi) ÷ specific activity (pCi/g)

	U-234	**U-235**	**U-238**	**Total g of uranium**
specific activity (pCi/g)=	**6.20E+09**	**2.10E+06**	**3.30E+05**	
g =	**232**	**25,381**	**924,242**	**949,855**

APPENDIX L: COST ESTIMATE

TABLES

ACRONYMS

D&D	decontamination and decommissioning
DFF&O	*The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto*
DOE	U.S. Department of Energy
EC	engineering category
FML	flexible membrane liner
FS	feasibility study
FY	fiscal year
GCL	geosynthetic clay liner
ILTS	interim leachate treatment system
IMTA	interim materials transfer area
NNSS	Nevada National Security Site
OMB	Office of Management and Budget
OSDC	on-Site disposal cell
PORTS	Portsmouth Gaseous Diffusion Plant
RC	regulatory category
RFP	request for proposal
RI	remedial investigation
S&M	surveillance and maintenance
WAC	waste acceptance criteria
WBS	work breakdown structure

Basis of Estimate for Waste Disposition Remedial Investigation/Feasibility Study (RI/FS) Cost Estimate

Introduction

Two action alternatives are presented in the waste disposition RI/FS: on-Site with some off-Site disposal and all off-Site disposal. Alternative 2, on-Site disposal, involves siting, constructing, and operating a potential engineered on-Site disposal cell (OSDC) for disposal of anticipated decontamination and decommissioning (D&D) waste (regulatory category [RC]-1) generated at the Portsmouth Gaseous Diffusion Plant (PORTS), referred to as *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) waste. In Alternative 2, waste not meeting a potential OSDC waste acceptance criteria (WAC) would be shipped to appropriate off-Site disposal facilities. Alternative 3, off-Site disposal, involves transporting and disposing of PORTS DFF&O waste at off-Site facilities.

Methodology

The U.S. Department of Energy's (DOE's) D&D contractor will perform the majority of the activities with direct-hired forces. Specialty subcontractors will be used as needed.

Estimate Type and Approach

This is a bottoms-up activity based cost estimate based on process knowledge of the project team. The estimates for the majority of the labor activities are based on field experience with similar waste management and disposal operations. The majority of the materials and equipment costs are based on vendor quotes and pricing guides such as R.S. Means and Richardson's. Labor costs were estimated using composite labor rates. Less defined items where no design was available, the details of the scope could not be accurately quantified, or that did not warrant more accuracy, were included as allowances based on project team and estimator judgment.

A total capital (unescalated) cost is presented including annual surveillance and maintenance (S&M) costs which are presented first as S&M during operation of the permanent leachate treatment system and second as S&M during operation of the passive leachate treatment system for a period of 1,000 years. A present value (capital, S&M, and total) cost is also presented.

Key Financial Data

- All costs included are in fiscal year (FY) 2013 unescalated dollars.
- A 7 percent sales tax has been added on all materials to account for Ohio sales tax.
- Contractor indirect cost of 12 percent has been added (no Contractor Indirects are applied to DOE Prime contract costs (i.e., Nevada National Security Site [NNSS] & Energy*Solutions* disposal fees).
- Net present value of unescalated costs has been calculated in FY 2010 dollars using a 2 percent real discount rate (Office of Management and Budget [OMB] 2011).
- No contingency is included.

Schedule

The design, construction, operation, and capping schedule for a potential OSDC is assumed to be 13 years. After that, the permanent leachate collection system would remain operational through year 2055, when it is then demolished. In fact, the system would be removed once the leachate generation rate has lessened and stabilized. S&M costs were estimated for 1,000 years after capping, but in 2055 the annual S&M costs are assumed to stabilize at a lower rate, reflecting the lower treatment costs from the passive leachate treatment system.

The off-Site disposal alternative is assumed to take 20 years to implement. This schedule is based on level funding. All S&M costs are assumed to be borne by the off-Site disposal cell operators and are included in the cost of disposal.

Basis of Estimate for Waste Disposition RI/FS
Alternative 2, On-Site Waste Disposal

The cost estimate is summarized in 16 work breakdown structure (WBS) items. The scope and estimate assumptions for each WBS item are presented below. Key parameters are shown in Table L.1. The total waste volume is either in situ volume or the segmented volume (primarily for converters), which is assumed to be the disposed volume for OSDC capacity determination. The volumes include waste generated as a result of D&D of PORTS (RC-1), as well as waste (RC-3, engineering category [EC]-2) generated from using contaminated soil as fill (RC-2, RC-3, EC-1). As applicable, bulked volumes were used for estimating the cost of transporting the waste.

Table L.1. On-Site Waste Disposal Alternative Key Parameters

Alternative parameters	Volume (Disposed) (cy)
Total waste volume (RC-1, RC-3, EC-2)	1,587,000
Waste volume for recycling	110,000
Waste volume for off-Site disposal	122,000
Waste volume for OSDC (RC-1, RC-3, EC-2)	1,354,000
Additional soil fill required for OSDC	2,549,000
OSDC capacity	3,903,000
OSDC waste footprint	1,430 ft by 1,600 ft (approximately 52.5 acres)

EC = engineering category
OSDC = on-Site disposal cell
RC = regulatory category

1. Regulatory Documents

Scope. Preparation of the Remedial Design Report, Remedial Action Work Plan, and Remedial Action Report in accordance with DFF&O requirements.

Estimate Assumptions

- A lump sum based on professional judgment is included.

2. Remedial Design Documents

Scope. Preparation of design drawings and specifications for OSDC and infrastructure construction, preparation of requests for proposals (RFPs), bid and award of subcontracts, and procurement support. Reference Section 8.3.2.1.1, *Potential OSDC design*, of the waste disposition RI/FS Report.

Estimate Assumptions

- Four RFPs would be prepared and four contracts would be awarded.
- The estimate for drawings, specifications and procurement packages for a potential OSDC and cap construction is estimated at 9 percent of the construction costs for a potential OSDC.
- The estimate for drawings, specifications and procurement packages for infrastructure and the leachate collection/treatment systems is estimated at 7 percent of the infrastructure construction costs.

3. Pre Design/Construction

Scope. Construction of test pits at potential borrow areas and within the disposal facility footprint; construction of test pads for materials of construction evaluations; demonstration of waste disposal methods; and installation of a global positioning system station. Reference Section 8.3.2.1.2, *Pre-design studies*, of the waste disposition RI/FS Report.

4. Cell Construction

Scope. Site preparation, rough cut grading, and construction of a potential OSDC and final cover; excavation and transfer of materials from the off-Site borrow area; establishing the on-Site stockpile area. Reference Sections 8.3.2.1.1, *Potential OSDC design*, and 8.3.2.1.3, *Site preparation and potential OSDC construction*, of the waste disposition RI/FS Report.

Estimate Assumptions

- 122 acres would be cleared and grubbed for a potential OSDC, 37 acres for the off-PORTS borrow area, and 100 acres for the on-Site stockpile area. Additional areas would be cleared as part of subsequent activities for a total of 320 acres cleared.
- 1,717,000 cy of bedrock would be cut at a potential OSDC and 394,000 cy at the off-PORTS borrow area.
- A potential OSDC would be constructed in a modular fashion and would have a compacted clay liner with a double geocomposite liner system, along with two low-permeability liners, a leachate collection and removal system, and a leak detection system. From the OSDC base the multi-layer liner system would include: 3 ft of compacted clay; a geosynthetic clay liner (GCL) and flexible membrane liner (FML); 1-ft-thick gravel leak detection layer in between the two geotextile layers; a primary liner consisting of an FML and low-permeability GCL; 1-ft-thick gravel layer and highly permeable geonet on sloping walls; and a 1-ft-thick soil layer.
- The final cover would be 10 ft thick. From the base the cover would consist of: 1-ft-thick soil cover; 2-ft-thick, low permeability, clay layer; a GCL and an FML; 1-ft-thick gravel drainage layer; 3-ft-thick biointrusion barrier; and 2-ft-thick vegetated soil layer.
- A bottoms up estimate was initially prepared for construction of a potential OSDC to dispose 4.77 million cy. The cost for construction of the potential OSDC in Alternative 2 was developed by scaling the costs down by 18 percent for a cell capacity of 3.90 million cy.

5. Infrastructure Construction

Scope. Upgrade of existing roads and railroad system; and construction of new haul roads, security roads, patrol road, interim materials transfer area (IMTA), IMTA contact water retention basins, sediment basins, support facilities, and the leachate transmission system. Reference Sections 8.3.2.1.1, *Potential*

OSDC design, and 8.3.2.1.3, *Site preparation and potential OSDC construction*, of the waste disposition RI/FS Report.

Estimate Assumptions

- The IMTA would encompass 23 acres and would be constructed of the following: 2-ft compacted base followed by a geotextile cushion, 60 mil geomembrane liner, geonet, geotextile fabric, and a 1-ft-thick layer of soil. The area would be surrounded with a perimeter berm tied to the contact water retention basin.

6. Interim Leachate Treatment System Construction

Scope. Construction of interim leachate treatment system (ILTS). Reference Section 8.3.2.1.1, *Potential OSDC design*, of the waste disposition RI/FS Report.

Estimate Assumptions

- The ILTS would be sized to treat 350 gpm of leachate and equipped with chemical precipitation, ion exchange, and carbon adsorption.

7. Cell Operations

Scope. Operation a potential OSDC and IMTA for 9 years. Reference Section 8.3.2.1.5, *Potential OSDC operations*, of the waste disposition RI/FS Report.

Estimate Assumptions

- On-Site disposal volumes are shown in Table L.1.

- A bottoms up estimate was prepared for operation of a potential OSDC for 5 years. The annual costs were extended to 9 years by increasing the estimate by 35 percent.

8. Waste Transport to Cell

Scope. Transporting waste meeting disposal facility WAC to a potential OSDC. Reference Section 8.3.2.1.5, *Potential OSDC operations*, of the waste disposition RI/FS Report.

Estimate Assumptions

- Total volumes transported are shown in Table L.1.

- Estimates were prepared using a unit rate assembly that combines labor, equipment and materials. The assembly was developed based on process knowledge from similar previous projects.

- The majority of waste would be transported to a potential OSDC in articulated dump trucks.

- Transportation is assumed to be completely within a radiological area, which allows transport without survey or tarps. This results in nominally 10 turns per day from the point of generation to a potential OSDC.

9. Off-Site Shipment and Disposal

Scope. Transporting waste not meeting WAC of a potential OSDC to off-Site disposal facilities. Reference Section 8.3.2.1.9, *Off-Site disposal*, of the waste disposition RI/FS Report.

Estimate Assumptions

- Volumes for off-Site disposal are shown in Table L.1.

- Estimates were prepared using unit rate assemblies for each disposal location that combines labor, equipment, materials, and transportation. The assemblies were developed based on process knowledge from previous projects.

- Gondola rail transport to Energy*Solutions* is assumed to require 3 months for loading, shipping, disposal, and return.

- Gondolas are weight limited.

- Disposal fees were from vendor quotes.

10. Interim Leachate Treatment System Operation During Cell Construction/Operations

Scope. Operating the ILTS for 9 years during OSDC construction and operations. Reference Section 8.3.2.1.1, *Potential OSDC design*, of the waste disposition RI/FS Report.

Estimate Assumptions

- An annual cost of labor, equipment, materials and subcontract support was estimated and extended for 9 years.

11. Cell Maintenance During Construction

Scope. Annual inspection and maintenance of the cell for 9 years during construction and operations of a potential OSDC. Reference Section 8.3.2.1.3, *Site preparation and potential OSDC construction*, of the waste disposition RI/FS Report.

Estimate Assumptions

- An annual cost of labor, equipment, materials and subcontract support was estimated and extended for 9 years.

12. Permanent Leachate Treatment Facility Construction

Scope. Construction and installation of the permanent leachate treatment facility. Reference Sections 8.3.2.1.1, *Potential OSDC design,* and 8.3.2.1.8, *Post-operations surveillance and maintenance*, of the waste disposition RI/FS Report.

Estimate Assumptions

- A bottoms up estimate for labor, materials, equipment, and subcontracted services was estimated.

13. Land Use Controls

Scope. Preparation of administrative control documents and legal support. Reference Section 8.3.2.1.8, *Post-operations surveillance and maintenance*, of the waste disposition RI/FS Report.

Estimate Assumptions

- Estimate provided as a lump sum based costs associated with similar projects.

14. Long Term S&M and Monitoring

Scope. Perform S&M and monitoring after OSDC capping. Reference Section 8.3.2.1.8, *Post-operations surveillance and maintenance,* of the waste disposition RI/FS Report.

Estimate Assumptions

- Annual inspection and maintenance of the disposal facility cap would continue after OSDC capping at the same annual cost as 2025.
- Security patrol would occur once per week after OSDC capping.
- Five-year-review regulatory reviews would be performed during years 1 through 30 after OSDC capping.
- The permanent leachate treatment system would be operated for 30 years after OSDC capping and removed and disposed of in year 2054. The passive leachate treatment system would not require any active S&M starting in year 2055.
- Seven groundwater wells would be sampled and analyzed quarterly for 30 years after OSDC capping and annually following.

15. Recyclables (Nickel) Staging Construction and Operations

Scope. Design, construction, transport to, and operations of a staging facility to store 6,400 metric tons of nickel recovered from X-330 and X-333 converters. Reference Section 8.3.2.1.10 *Recycling and/or reuse*, of the waste disposition RI/FS Report.

Estimate Assumptions

- X-744G will be hardened for secure storage and the roof replaced with a membrane roof.
- Nickel in IP-1 containers (provided by the segmentation process in the Process Buildings and Complex Facilities D&D Evaluation RI/FS) with security locks will be transported. Nominally 3,000 trips with a forklift will be used.
- Active secure staging (filling the facility) will occur for 5 years; 4 additional years of passive staging is assumed before the nickel is removed for recovery and decontamination. Removal, further transport, recovery and decontamination is not in the scope.

16. Fill Soil From Landfills and Plumes (RC-2, RC-3)

Scope. Regulatory documents, remedial design, and pre-design characterization will be performed for each landfill and plume area. Site preparation and remediation will occur with excavation control characterization. Impacted soils (and waste requiring fill [RC-3, EC-2] from the landfills) will be transported to a potential OSDC for use as fill. Placement of the fill soil and landfill waste at a potential OSDC is included in Cell Operations above. Soils not meeting the OSDC WAC will be treated on Site before transport for disposal at a potential OSDC. Waste not meeting the OSDC WAC will be packaged and transported to off-Site treatment and disposal (Energy*Solutions*). Reference Section 8.3.2.1.6 *Fill operations*, of the waste disposition RI/FS Report.

Estimate Assumptions

- Total volumes excavated and transported are 222,000 cy of landfill waste requiring fill (RC-3, EC-2) and 1,839,000 cy of contaminated soils (RC-2, RC-3 and EC-1). An additional 710,000 cy of clean soil is needed to be transported from the landfill areas (overburden or cap materials) to a potential OSDC to meet the fill needs.

- Estimates were prepared using a unit rate assembly that combines labor, equipment and materials. The assembly was developed based on process knowledge from similar previous projects.

- The majority of fill (and landfill waste) is transported to a potential OSDC in articulated dump trucks.

- Excavation and transportation is assumed to be completely within a radiological area which allows transport without survey or tarps. This results in nominally 10 turns per day from the point of generation to a potential OSDC.

- All landfill cap material and 14 percent of the plume clean overburden will be transported to a potential OSDC for use as fill. The remainder of the plume overburden will be stockpiled and restored to the excavation during site restoration.

- Site restoration will include contouring of the excavation area to promote runoff to existing streams and bodies of water, including revegetation and runoff controls.

Basis of Estimate for Waste Disposition RI/FS
Alternative 3, Off-Site Waste Disposal

The cost estimate for off-Site disposal is summarized in five WBS items. The scope and estimate assumptions for each WBS item are presented below. Key parameters for the off-Site disposal alternative are shown in Table L.3. The waste volume is presented based on in situ volumes; however, estimates use the bulked volume for transport and disposal off Site. In the case of segmented process gas equipment, transport and disposal estimates factor in a segmentation ratio for off-Site transport and disposal. The major differences in volumes from the on-Site alternative are the absence of waste requiring fill from the landfills (RC-2, RC-3 and EC-2) and the quantity and extent of process gas equipment segmentation. More information can be found in Section 8.3.3.2, *Detailed description of off-Site alternative,* of the waste disposition RI/FS.

Table L.2. Off-Site Waste Disposal Alternative Key Parameters

Alternative parameters	Volume (In Situ) (cy)
Total waste volume	1,467,000
Waste Disposal at NNSS	272,000
Waste Disposal at ES	845,000
Waste Disposal at Pike Sanitation Landfill	240,000
Recycle and/or reuse	110,000

ES = Energy*Solutions*
NNSS = Nevada National Security Site

1. Regulatory Documents

Scope. Preparation of the Remedial Design Report, Remedial Action Work Plan, and Remedial Action Report in accordance with DFF&O requirements.

Estimate Assumptions

- The level of effort is based on experience at other DOE facilities.

2. Remedial Design Documents

Scope. Preparation of design drawings and specifications for infrastructure modifications, specifications for off-Site waste shipments and RFPs; bid and award of subcontracts; and procurement support.

Estimate Assumptions

- Six RFPs would be prepared and six contracts would be awarded.

- The estimate for drawings, specifications and procurement packages for infrastructure modifications is estimated at 7 percent of the infrastructure construction costs.

3. Infrastructure Construction

Scope. Upgrade of existing roads and railroad system and construction of loading and transfer stations.

Estimate Assumptions

- The level of effort required and cost are based on estimator's judgment based on preliminary drawings.

4. Recyclables (Nickel) Staging Construction and Operations

Scope. Construction, transport to, and operations of a staging facility to store 6,400 metric tons of nickel recovered from X-330 and X-333 converters. Reference Section 8.3.2.1.10 *Recycling and/or reuse* of the waste disposition RI/FS Report.

Estimate Assumptions

- All assumptions are the same as the on-Site alternative, including passive storage for only 4 years before recovery and decontamination begins.

5. Off-Site Shipment and Disposal

Scope. Transportation of all alternative waste to an appropriate off-Site facility for disposal.

Estimate Assumptions

- Waste volumes to be shipped to each disposal facility are shown in Table L.3.

- Estimates were prepared using unit rate assemblies that combine labor, equipment, and materials (such as waste packages). The assemblies were developed based on process knowledge from previous projects.

- Gondola rail transport to Energy*Solutions* is assumed to require 3 months for loading, shipping, disposal, and return.

- Gondolas are weight limited.

- Disposal fees were obtained from Energy*Solutions* and Pike Sanitation Landfill. The NNSS disposal facility is directly funded by DOE-National Nuclear Safety Administration. Therefore, no chargeback or fee is applicable. To legitimately compare disposal alternatives, the FY 11 for disposal at NNSS was used as the disposal fee.

Estimate Cost Summary

Summary Description	Costs
	Unescalated-FY 2013 $
Capital Costs	
Indirect Cost for OSDC	
Regulatory Documents	$414,086
Remedial Design	
Remedial Design Documents	$34,649,513
Pre Design/Construction Activities	$9,149,384
Total OSDC Indirect Cost	**$44,212,984**
Direct Cost for OSDC	
Cell Construction	$273,285,480
Infrastructure Construction	$53,659,075
Interim Leachate Treatment System Construction	$4,756,562
Cell Operations	$158,440,000
Waste Transport to Cell	$30,442,747
Off Site Shipment and Disposal	$154,370,787
Interim Leachate Treatment System Operation During Cell Construction/Operations	$8,490,574
Cell Maintenance During Construction	$1,922,666
Permanent Leachate Treatment Facility Construction	$741,120
Land Use Controls	$176,232
Total OSDC Direct Cost	**$686,285,243**
Direct/Indirect Costs for Other	
Recyclables (Nickel) Staging Construction and Operations	$14,527,577
Fill Soil from Landfills and Plumes	$273,988,206
Total Other Direct/Indirect Cost	**$288,515,784**
Total Capital Cost	**$1,019,014,011**
Surveillance and Maintenance (S & M)	
S & M and Monitoring-Year 1 thru 30-Annual Cost	$665,496
S & M and Monitoring-Year 31 and Out-Annual Cost	$131,915
Net Present Value (FY 2010 Dollars)	
Present Value for Capital	$868,331,389
Present Value for S & M (1,000 years)	$14,021,748
Present Value Total	**$882,353,136**

**** TOTAL **** **$ 318,616,196**

The above Estimate is for Cell Construction for a Total Cell Volume of approx. 4,770,000 CY (including soil cover) and amounts to approx.$66.80./CY . The Total Cell Volume for the RI/FS-DFFO/CERCLA Case is Approx. 3,900,000 CY. Therefore the Cell Construction Estimated Cost for the RI/FS -DFFO/CERCLA Case is $66.80/CY X 3,900,000 = $260,520,000 FY2011 $

USE **$273,285,480 FY 2013 $**

NOTE: The above Estimate is for a Waste Cell Volume Total of approx. 3.56 million CY.

The above Estimate is for Cell Operations for a Waste Volume Total of approx. 3.56 million CY without Clay processing. The Waste Volume Total for the RI/FS DFFO/CERCLA Case is approx. 3.90 million CY. Therefore the Cell Operating Estimated Cost for the RI/FS DFFO/CERCLA Case is 3.90/3.56 for an increase of 9.6% or 1.096 X $137,809,795=$151,039,535 (FY 2011 $)

USE $158,440,000 (FY 2013 $)

		Indirects @ 12 %				$2.30
		Total FY 2011 $	CY			**$21.43**

Notes:
Qty (above) = FTEs (for Labor, Equip & PPE) and Units/Production Rate (for other items)
Labor/Equip/PPE Unit Rate Calc = ((Qty x Hrs/Day)/Prod Rate))/Prod Factor
Material/Subcontract/Other Costs Unit Rate Calc = Qty/Container Waste Volume
Unit Rates = Hours or Units per Each
3,915 CF/Day = Production rate is based on 10 loads/day

Note: Rates are based on generation, transport and disposal all being a radiological operation with no transition surveys.

Landfill and Plume Remediation Cost Summary

Summary Description	Costs Unescalated FY 2013 $
Capital Costs	
Regulatory Documents	$600,000
Remedial Design	
Remedial Design Documents	$11,496,400
Pre Design Sampling Activities	$960,887
Subtotal Indirect Costs	**$13,057,286**
Remedial Action	
General Construction Support	$2,531,405
Site Preparation	$1,621,478
Landfill Soil Excavation and Transport	$18,425,231
Debris Excavation and Transport	$3,637,171
Landfill Remediation w / Off Site Disposal	$3,689,638
Plumes Soil Excavation and Transport	$205,242,032
Excavation Control Sampling	$1,429,276
Soil Treatment (Landfill and Plumes)	$18,360,450
Remediation Site Restoration	$5,994,238
Subtotal Direct Costs	**$260,930,920**
Total Capital Cost	**$273,988,206**

PREAMBLE

The Portsmouth Gaseous Diffusion Plant (PORTS) cleanup project is one of the largest environmental cleanup projects underway in the nation today. As described in the Site-wide Waste Disposition Evaluation Project (Waste Disposition) Remedial Investigation/Feasibility Study (RI/FS) and the subsequent Intermediate Design Package for the potential on-Site disposal cell (OSDC), the PORTS cleanup project is anticipated to produce nearly 1.4 million cy of decontamination and decommissioning (D&D) waste from the demolition of approximately 250 buildings, structures, and systems. The approximate 250 buildings, structures, and systems are found within a 1,000-acre industrial area near the center of the 3,777-acre U.S. Department of Energy (DOE) Portsmouth federal reservation. The complete PORTS cleanup project is likely to take more than 30 years to implement[1].

Of the 1.4 million cy of D&D waste anticipated from the cleanup conducted under *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O), it is estimated that 1.1 million cy would be suitable for on-Site disposal, should Alternative 2, the combined on-Site and off-Site waste disposal alternative from the Waste Disposition RI/FS, be selected as the preferred alternative in the forthcoming Waste Disposition Proposed Plan. The remaining waste volume (approximately 300,000 cy) would be sent off Site for disposal or recycling as appropriate. For planning purposes, it is estimated that once recycling initiatives are met, about 85 percent of the D&D waste volume would remain on Site in the new OSDC, and about 15 percent would be sent off Site for disposal should Alternative 2 be selected as the preferred alternative in the Proposed Plan.

Placement of the 1.1 million cy of D&D waste in a new potential OSDC would require an additional 2.65 million cy of engineered fill soil to properly place the waste, fill void spaces, and achieve design-based waste placement compaction requirements for the OSDC. The sources of engineered fill (herein "engineered fill" or "fill") can either be uncontaminated (purchased fill or fill obtained from on-site clean borrow areas) or can be from contaminated on-site areas provided the contaminated fill meets the waste acceptance criteria of a potential OSDC.

Regardless of the source of fill, roughly 221,000 truckloads of fill would be needed, resulting in an average of 35 to 40 trucks a day, every working day for upwards of 25 years. If an off-site clean source of fill is used, more than 2 million additional road miles would be needed to transport the fill to PORTS. The planning capacity for the potential OSDC is 5 million cy, and at completion, would occupy a dedicated land area of about 100 acres.

To place the size and magnitude of the PORTS D&D cleanup project into perspective, the anticipated D&D waste volume of 1.4 million cy is nearly triple the D&D waste volume encountered at the Fernald DOE cleanup site, the largest environmental cleanup project conducted to date in the State of Ohio. The volume far exceeds the U. S. Environmental Protection Agency's (EPA's) ranking of the largest cleanup sites in the country, where EPA ranks the largest sites based on a rule-of-thumb index as those sites containing 50,000 cy or more of affected waste volume. Of the nation's largest sites, those with

---

[1] As support for the Corrective Action Management Unit (CAMU) designation by the Ohio Environmental Protection Agency (Ohio EPA) Director, this supplement contains additional information that has been updated since the Waste Disposition RI/FS, primarily from the Intermediate Design Package for the OSDC and cost and schedule information from the revised life-cycle baseline for PORTS. As part of the updates, funding projections have changed significantly, potentially affecting the cost estimates and durations of the overall project. Currently, based on funding, the schedule estimate requires 30 years for completion, whereas the RI/FS assumed a 10-year duration if on-Site disposal is selected as the preferred alternative.

more than $50 million in total estimated costs are considered to be the nation's clean-up "megasites" (EPA 2003). Clearly, with the 1.4 million cy projected D&D waste volume, and the estimated disposal-only costs[2] of $882 million for Alternative 2 in the Waste Disposition RI/FS, the PORTS cleanup project ranks as one of the nation's largest and more costly cleanup sites.

The Ohio EPA has been working with DOE and overseeing the remediation of environmental media at PORTS for the past 25 years, since 1989 when the Consent Decree with Ohio EPA along with the Administrative Consent Order with EPA were signed. As PORTS has been in the corrective action program for those 25 years with dedicated oversight by the regulators (resulting in eight Resource Conservation and Recovery Act of 1976, as amended [RCRA] Facility Investigation final reports and associated Cleanup Alternatives Study/Corrective Measures Study reports, along with seven major decision documents), Ohio EPA has detailed knowledge of the history of PORTS, previous releases, historical and current environmental conditions, and has been involved with the various treatment technologies applied at PORTS.

In turn, DOE is working with Ohio EPA to make the best possible environmental decisions for the D&D of PORTS and the cleanup of the environmental media contamination outside the D&D activities, considering regulatory requirements, the need to provide short- and long-term protection of workers and the public, and the need to be good stewards of the money that will be used to fund the cleanup. One of the tools under consideration by DOE and Ohio EPA as part of the decision making is the use of the CAMU rule (67 Federal Register 2962, January 22, 2002) to help facilitate implementation of the PORTS cleanup project. The CAMU rule was adopted as an applicable or relevant and appropriate requirement in the Waste Disposition RI/FS, for consideration under Alternative 2.

EPA recognized in its 2002 Amendments to the CAMU rule that the comprehensive regulatory framework that governs the identification, generation, transportation, treatment, storage and disposal of hazardous wastes (the 1984 Hazardous and Solid Waste Amendments to RCRA) can present serious disincentives to management of hazardous wastes during cleanups. As EPA noted in the development of the CAMU rule, when the land disposal restriction (LDR) requirements for as-generated industrial RCRA hazardous wastes are applied in the context of site cleanup, EPA has found they can act as disincentives to decisions to excavate and consolidate cleanup wastes for disposal. EPA also recognized there may be significant physical and chemical differences between "as-generated" RCRA hazardous industrial wastes and cleanup wastes that affect their ability to undergo treatment. EPA indicated it has been its experience that application of the regulations developed for as-generated industrial hazardous wastes, in particular the LDRs and minimum technical requirements, to cleanup wastes often presents remediation project managers with only two choices: to pursue the legal option of capping or treating cleanup wastes in place, thereby avoiding the LDR and certain other management requirements; or, excavating the cleanup waste and treating it to the full extent required by the LDR requirements and disposing of the waste in compliance with the as-generated hazardous waste disposal unit requirements. EPA has found that this situation has created an incentive at certain cleanup sites to select less permanent remedies that involve leaving the cleanup wastes in place.

The CAMU rule promulgated by EPA and subsequently by Ohio EPA (*Ohio Administrative Code* [*OAC*] 3745-57-72) provides for the creation of special units under RCRA to facilitate treatment, storage,

---

[2] When the Waste Disposition RI/FS was developed, the available funding projections were used to develop cost estimates for the two action alternatives (Alternatives 2 and 3) as explained in Section 9.3.1 of the RI/FS. An evaluation was performed during the RI/FS to determine the impact declining funds and increasing schedules would have on the cost estimates. Costs for both alternatives would increase as the schedule increases; however, Alternative 2 remains less expensive than Alternative 3, even if the duration triples over the original assumption.

and disposal of hazardous wastes managed for implementing cleanup actions. These special units, known as CAMUs, require designation by the Director of the Ohio EPA. CAMU designations by the Ohio EPA Director are made on a case-by-case basis for cleanup sites, considering site-specific needs and conditions. The Waste Disposition RI/FS indicated that DOE would be seeking a CAMU treatment, storage, and disposal unit designation from the Ohio EPA Director for a potential OSDC at PORTS under *OAC* 3745-57-72.

This supplement to the Waste Disposition RI/FS provides the information for the Director to consider for issuing a CAMU designation for the potential OSDC under Alternative 2. Using the information presented in this Waste Disposition RI/FS supplement, DOE is requesting the following from the Ohio EPA Director:

- Designate the potential OSDC described in Alternative 2 of the Waste Disposition RI/FS as a treatment, storage, and disposal CAMU, if Alternative 2 is selected, contingent on approval of the design plans for the CAMU which demonstrate compliance with all applicable CAMU rules.

- Designate the Impacted Material Transfer Area described in Alternative 2 of the Waste Disposition RI/FS as a storage and/or treatment CAMU, if Alternative 2 is selected, contingent on approval of the design plans for the CAMU which demonstrate compliance with all applicable CAMU rules.

- Concur with the proposed process for identifying principal hazardous constituents (PHCs) and associated treatment standards at PORTS, as described in this document.

- Concur that trichloroethene (TCE) is the only currently identified PHC at PORTS, although additional PHCs could potentially be identified as additional data is collected in future environmental remediation efforts. The proposed process for identifying PHCs, as described in this document, will remain in effect over the life of Alternative 2, if Alternative 2 is selected.

- Concur with a cost-effective adjusted standard of 5,000 mg/kg for TCE that is protective of human health and the environment, based on application of Ohio EPA’s adjustment factors under the CAMU rule, as described in this document. DOE is proposing an adjusted standard of 5,000 mg/kg for TCE in PORTS soils to serve as a ceiling limit after the preparation of the soils, including dewatering if needed, to meet all other waste acceptance criteria. This adjusted standard will help support the productive use of contaminated soil at PORTS as waste-placement fill in the new potential OSDC if Alternative 2 is selected. If soils have TCE concentrations over 5,000 mg/kg after necessary preparation or blending to meet other OSDC operational requirements, the soils would be segregated and further treated in accordance with applicable or relevant and appropriate requirements to meet the 5,000 mg/kg ceiling limit, or otherwise shipped off Site for treatment and disposal.

- Concur that if additional PHCs beyond TCE are identified during the design and implementation of the remediation efforts at PORTS, additional treatment standard(s) or adjusted standard(s) will be developed using the approaches described in this document, subject to Ohio EPA’s approval/concurrence.

- With the approval/concurrence of design plans, and following public notice requirements, Ohio EPA can authorize future storage and/or treatment CAMUs that may be necessary during the design and implementation of the remediation efforts at PORTS. These CAMUs will meet all applicable CAMU and staging pile rule requirements, including design, operation and closure requirements, and plans for such CAMUs demonstrating compliance with all applicable rules, which will be submitted to Ohio EPA for approval/concurrence.

Designation of CAMUs for the PORTS cleanup project will promote the cost-effective D&D of PORTS' structures and remediation of "residual soil" (as defined by the DFF&O). The rule will also allow the project to focus on using contaminated fill for placement of D&D waste in a new potential OSDC, versus the alternative of purchasing clean soil. Considering the entirety of the PORTS cleanup and all potential waste streams anticipated for disposal in the potential OSDC, DOE has conducted economic and other evaluations of the trade-offs of using contaminated soil versus clean purchased soil as fill materials for the OSDC. (Note that all anticipated waste is to be considered as required by the DFF&O RI/FS statement of work [Attachment A of the DFF&O, Section 3.5.1].) This evaluation found that the use of contaminated soil can be done economically in a manner that is safe for the workforce; is protective of human health; and will not exacerbate the contamination already present in the areas in which fill could be contained. The use of contaminated soil from select landfills and contaminated soil associated with groundwater contamination as fill will remove considerable mass of contamination from the environment quickly. It is also projected to save costs in the future by shortening the time required for active groundwater restoration efforts.

The CAMU rule and its flexibilities for developing cost-effective treatment levels is important to DOE both when considering the use of contaminated fill to meet the extensive fill demands (2.65 million cy) anticipated for a potential OSDC, and when evaluating alternatives for other anticipated environmental media cleanup actions under the Ohio Consent Decree or other regulatory authorizations. If a cost-effective TCE treatment level for contaminated fill soil cannot be established through the CAMU rule, PORTS project decision makers may not have the economic motivations to seek contaminated fill soil as a preference, and would therefore be economically inclined to pursue the clean fill option; thus leaving the various compliant landfills in place without consolidation into the state-of-the-art OSDC and continuing with long-term groundwater extraction and treatment operations, as necessary.

This supplement to the Waste Disposition RI/FS contains the information for the Ohio EPA Director to provide the agency's CAMU designations and PHC treatment level determinations for inclusion in the Waste Disposition Proposed Plan and Record of Decision (ROD), if Alternative 2 is selected for the disposal of DFF&O-authorized D&D waste. The CAMU designations and PHC treatment levels adopted by the Waste Disposition ROD would then be available for universal application to all other anticipated non-DFF&O waste streams envisioned for on-Site disposal, using the appropriate regulatory authorizations/approvals for on-Site disposal of the non-DFF&O waste as necessary.

INTRODUCTION

The Waste Disposition Remedial Investigation/Feasibility Study (RI/FS) for the Portsmouth Gaseous Diffusion Plant (PORTS) (U.S. Department of Energy [DOE] 2014) identified that DOE would be seeking a Corrective Action Management Unit (CAMU) designation for a potential on-Site disposal cell (OSDC) that is part of Alternative 2 as a treatment, storage and disposal unit under *Ohio Administrative Code (OAC)* 3745-57-72, which is already included in the applicable or relevant and appropriate requirements (ARARs) of the Waste Disposition RI/FS. During the identification of the preferred alternative for the Waste Disposition decision that occurs after the RI/FS (during preparation of the Proposed Plan), both agencies (DOE and the Ohio Environmental Protection Agency [Ohio EPA]) have agreed that the Waste Disposition Record of Decision (ROD) should designate a potential OSDC as a CAMU, if an OSDC is part of the selected alternative.

To allow the Director of Ohio EPA to designate a potential OSDC as a CAMU, and to then provide an opportunity for public review of that designation, the regulation requires that certain information be provided. This supplement to the Waste Disposition RI/FS provides the information necessary for the Director to designate a potential OSDC as a CAMU in the ROD once public comments are considered.

The CAMU designation of a potential OSDC at PORTS allows for the excavation, consolidation, and on-Site disposal of cleanup wastes that are contaminated with Resource Conservation and Recovery Act of 1976, as amended (RCRA)-regulated hazardous wastes and hazardous wastes constituents into a potential OSDC, provided the wastes meet all waste acceptance criteria (WAC), including all waste treatment standards established for disposal in the CAMU. This supplement includes a discussion of the designated area of contamination (AOC); the information needed for the Director's approval of a potential OSDC and Impacted Material Transfer Area (IMTA) as CAMUs; a discussion of the waste that is considered CAMU-eligible; the process for identifying principal hazardous constituents (PHCs); and the basis for the adjusted standard based on adjustment factors for trichloroethene (TCE), the only PHC currently identified. The supplement also describes the potential for identifying and designating future storage and/or treatment CAMUs that may be necessary during the design and implementation of the remediation efforts at PORTS. DOE seeks the Director's authorization to establish these CAMUs, contingent on approval of design plans, which will meet all applicable CAMU and staging pile rule requirements, including design, operation and closure requirements. These design plans for such CAMUs, demonstrating compliance with all applicable rules, will be submitted to Ohio EPA for concurrence/approval. Whenever excavation and/or disposal of non-decontamination and decommissioning (D&D) waste (soils and wastes under a regulatory category other than the *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* [DFF&O]) is discussed in this document, whether in terms of additional waste material or fill, it is to be understood that additional authorization/approval would be required to undertake this activity.

The data which is evaluated within this supplement to the Waste Disposition RI/FS report for the proposed CAMU has been collected over the last 25 years under the oversight and approval of Ohio EPA and the U.S. Environmental Protection Agency (EPA). The data was collected in response to the requirements of the 1989 Consent Decree; the EPA Administrative Order by Consent, issued on September 29, 1989 (1989 Administrative Order by Consent) and amended on May 11, 1994 (1994 Administrative Order by Consent); and the Administrative Consent Order issued on August 11, 1997 (1997 Administrative Consent Order), which replaced the 1994 EPA Administrative Order by Consent. References to reports generated under these regulatory authorities are presented in the section entitled "Identification of CAMU-Eligible Waste Streams"; the references are located in the Administrative Records and can be accessed at the Environmental Information Center.

The key information necessary for consideration by the Director of the Ohio EPA is presented in the main text of this document. Five appendices have been included to provide more detailed information to support the technical conclusions drawn in the document. The five appendices and their contents are as follows:

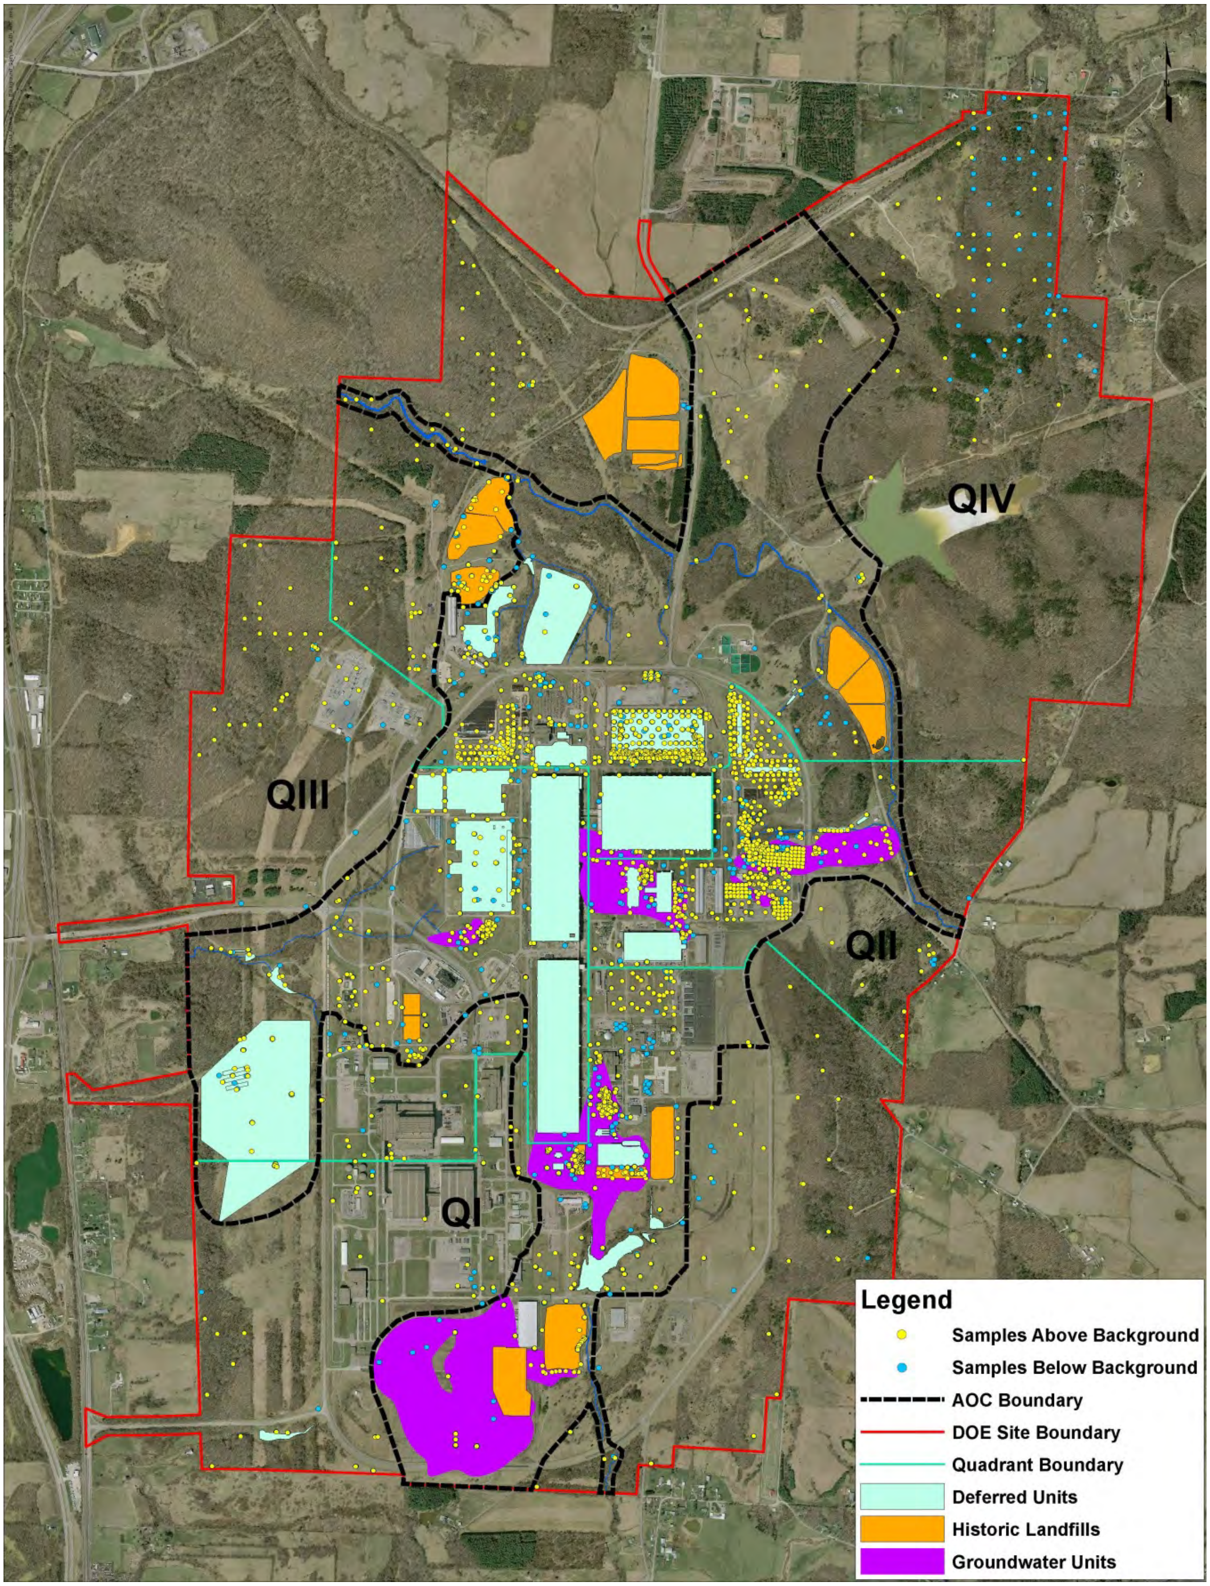
- Appendix A: Area of Contamination Identification
- Appendix B: Comparison Crosswalk of *OAC* 3745-57-72 Requirements to DOE's Proposed Approach for CAMU Designations
- Appendix C: Identification of Anticipated CAMU-Eligible Waste Streams Associated with the PORTS Cleanup
- Appendix D: Identification of Principal Hazardous Constituents
- Appendix E: Adjusted Treatment Standard.

RECOGNITION OF THE AREA OF CONTAMINATION

Along with the CAMU designation, DOE is asking the Ohio EPA Director to recognize a portion of the PORTS Facility as an AOC as a tool for the efficient management and consolidation of remediation wastes generated during implementation of the cleanup actions at PORTS. Through extensive sampling, DOE has defined the horizontal boundaries of the AOC at DOE's Portsmouth reservation as depicted in Figure 1. While the contiguous vertical depth of contamination within this area varies, by using this extensive sampling data, DOE will be able to navigate during the remediation to either ensure remedial activities comport with the AOC Policy when working in contaminated media for purposes of RCRA compliance, or use other appropriate remedial regulatory tools, such as storage/treatment CAMUs as discussed in the document, when remedial activities are outside the scope of the AOC policy. Furthermore, while extensive sample data results have not been gathered from underneath buildings within the potential AOC, DOE believes that, at a minimum, the Director should concur that these areas under the buildings would be within the general horizontal AOC presented. These buildings, as they exist currently, are encompassed by other areas of generally dispersed contamination and therefore fall within the scope of an AOC.

Using the AOC would allow for the unencumbered movement of D&D wastes, waste not within DFF&O (non-DFF&O waste), and other remediation waste within the confines of the AOC, without triggering the generation of hazardous waste that would result in the need for additional handling requirements to be implemented.

The justification for the AOC boundaries is presented in Appendix A. In general, the areas of soil and groundwater contamination identified over 25 years of environmental studies conducted under the Ohio Consent Decree through RCRA Facility Investigations (RFIs), as well as closed landfills, are all included within the boundary of the AOC.



Note: The AOC also includes the wastewater outfall line to the Scioto River.

Figure 1. Area of Contamination Lateral Boundary

DESIGNATION OF TWO CORRECTIVE ACTION MANAGEMENT UNITS AT PORTS

DOE has provided information in this document to: (1) support the designation of the potential OSDC as a treatment, storage and disposal CAMU, if Alternative 2 from the Waste Disposition RI/FS is selected in the Waste Disposition Proposed Plan; and (2) to support the designation of the IMTA associated with the potential OSDC as a storage and/or treatment CAMU.

The locations of both potential CAMUs are presented in Figure 2. In designating the two CAMUs, DOE is providing information to address the criteria set forth in *OAC* 3745-57-72. Appendix B to this supplement provides a crosswalk of the various requirements of the regulations against a demonstration of how the requirements would be met by the potential OSDC and IMTA, based on the technical information contained in the Waste Disposition RI/FS and the Intermediate Design Package previously submitted to Ohio EPA.

It is also recognized in this supplement that the potential exists for the need to designate additional storage and/or treatment CAMUs during remedial design or in the selection of other PORTS cleanup actions outside the DFF&O; these designations, if found to be necessary, would be addressed in future regulatory submittals to Ohio EPA.

Designation of the Potential OSDC as a Treatment, Storage and Disposal CAMU

OAC 3745-57-72(C) requires that the Director consider the following seven elements when designating a treatment, storage and disposal CAMU, which only applies to the potential OSDC. The federal CAMU rule documented in 58 Federal Register (FR) 8658, February 16, 1993, states that the rationale for a CAMU decision generally only needs to address those criteria that are considered determinative for a given CAMU designation. All seven criteria specified in the rule are discussed below.

1) *The CAMU facilitates the implementation of a reliable, effective, protective, and cost-effective remedy.*

   EPA has included this criterion to "*… emphasiz[e] that a CAMU is not intended as a mechanism that will undercut the protectiveness of remedies; rather, CAMUs will facilitate the implementation of more reliable, effective, protective, and cost-effective remedies.*" (58 FR 8658, February 16, 1993). As indicated in the preamble to the rule, EPA does not require detailed cost-benefit or other quantitative analyses.

   There are three potential sources of RCRA-hazardous waste that are anticipated to be encountered in the remediation of PORTS. One is a waste stream from work to be performed under the DFF&O while the others would result from actions conducted under other regulatory authorities. All anticipated waste must be considered as required by the DFF&O RI/FS statement of work (Attachment A of the DFF&O, Section 3.5.1). Each source of RCRA-hazardous waste is described in more detail below.

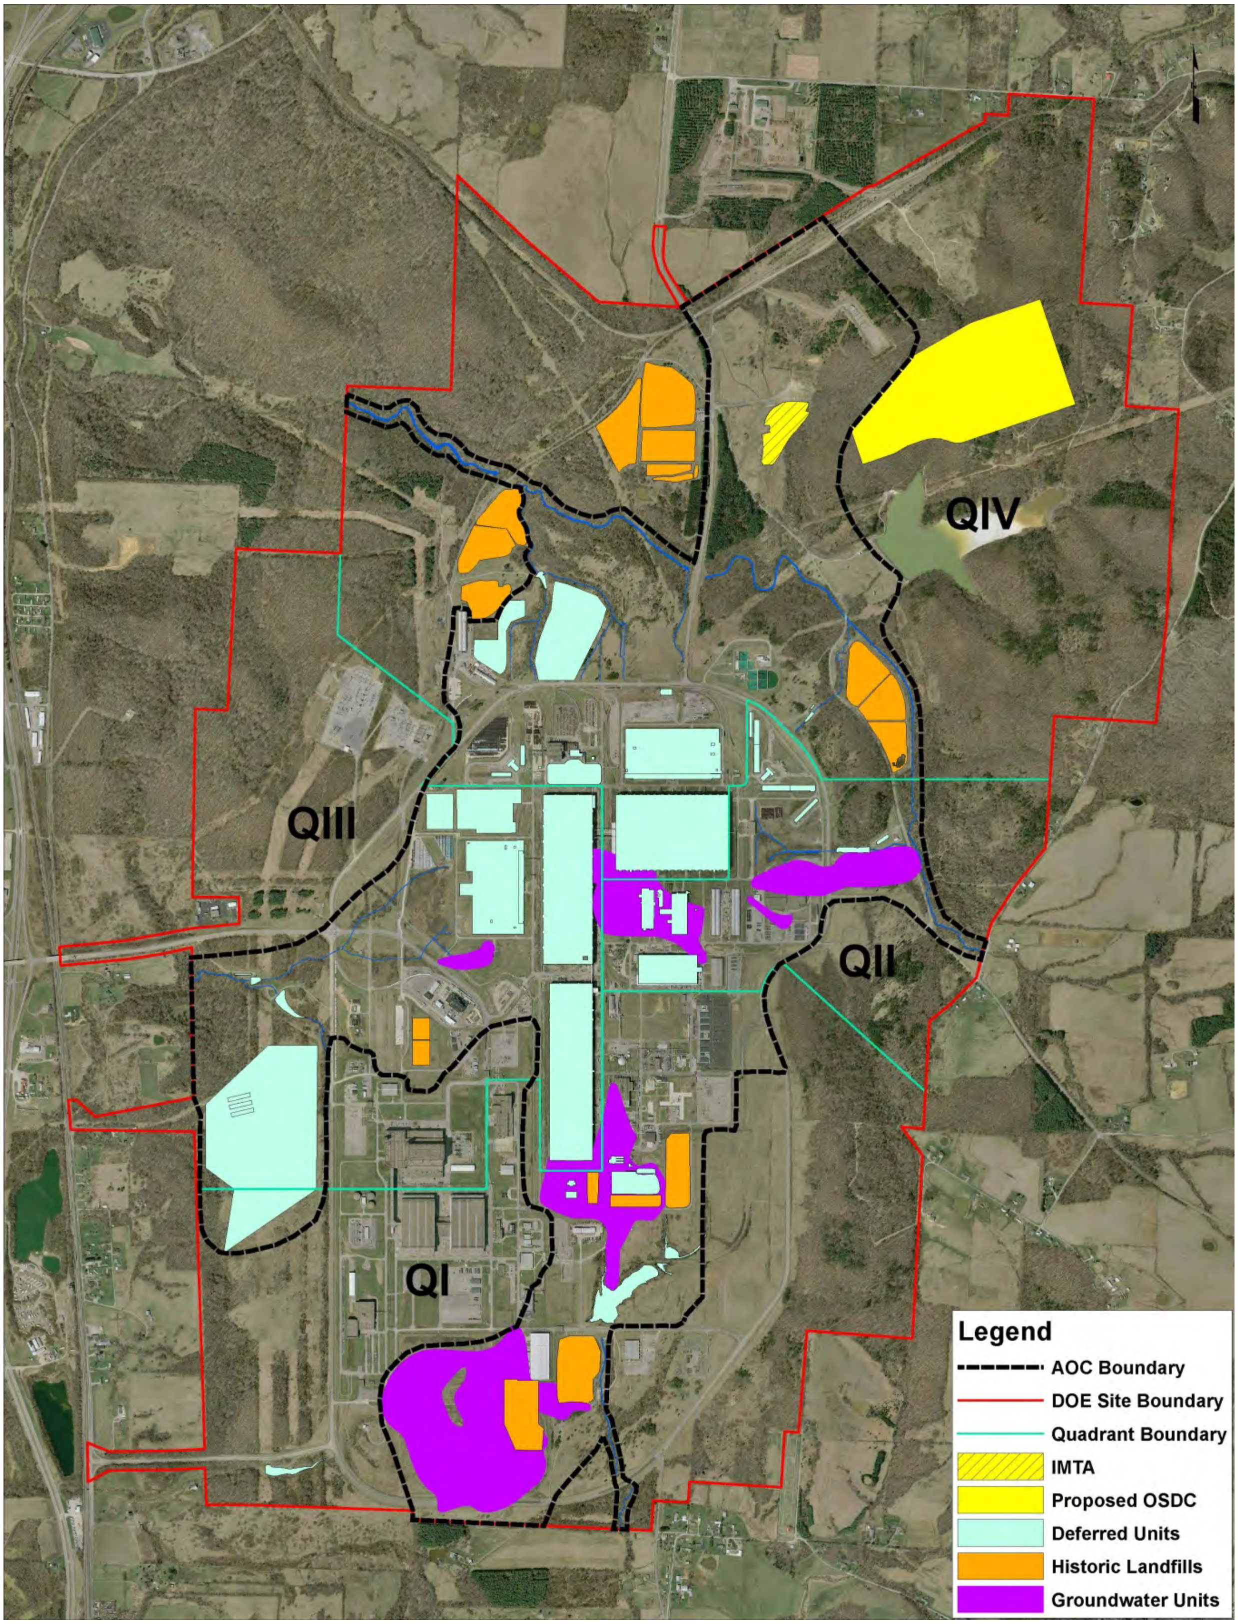


Figure 2. Location of Treatment, Storage, and Disposal CAMU and Treatment and Storage CAMU

1) **RCRA-hazardous wastes encountered during building D&D activities.** Both CAMU-eligible and CAMU-ineligible RCRA-hazardous wastes are anticipated to be produced during building D&D activities, including those wastes that are considered “residual soil” as defined by the DFF&O. Waste created during deactivation or demolition of buildings is considered CAMU-eligible as these actions are managed as part of the implementation of the PORTS cleanup. Current plans are for all CAMU-ineligible RCRA-hazardous waste to be removed from the interior of the buildings prior to demolition and sent off the Site for appropriate treatment and compliant disposal. And while the current plan is to also remove CAMU-eligible RCRA listed or characteristic waste (for example, universal waste) from the interior of the buildings prior to demolition and send that removed waste off Site for disposal or recycling, there is the potential in the future that the off-Site disposal facilities for such waste are no longer available or are not an effective option. The D&D project is likely to be a 30-year project and the cost or availability of off-Site disposal options could change in that time frame. In that case, consideration to dispose of some of this CAMU-eligible waste at a potential OSDC needs to be an option. No waste from the building contents or structures has currently been identified in this category; however, there is a small volume of CAMU-eligible residual soil that is considered as hazardous waste that is planned to be disposed on Site.

2) **Contaminated soil and associated waste contemplated for use as engineered fill for a potential OSDC.** DOE has conducted an economic analysis in support of the Waste Disposition RI/FS that shows that the initial short-term investment cost of nearly $400[3] million to excavate select landfills and groundwater contamination areas to use the materials as OSDC fill (compared to purchasing clean fill at a short-term cost of $28 million) can have advantageous life-cycle cost benefits when the opportunity to reduce long-term groundwater extraction and treatment costs is considered. Groundwater restoration at PORTS is projected in some instances to take 300 years or more. But if contaminated fill is used, over the long term there would be a projected cost avoidance resulting from shortening groundwater restoration efforts. This is because the contaminated fill option provides the opportunity to directly remove contaminant sources from the groundwater contamination areas and to then reduce and ultimately eliminate long-term active groundwater extraction and treatment operations. Use of the cheaper-in-the-short-term clean fill would not provide the opportunity to reduce or eliminate the long-term active groundwater extraction and treatment operations, and is therefore the less preferable option in the long term. Some of the soil anticipated to be used as fill is currently determined by Ohio EPA to contain F-listed RCRA-hazardous waste.

3) **Contaminated soil and associated waste from future Ohio Consent Decree decision(s).** Future remediation decisions that will take place for the deferred solid waste management units (SWMUs) under the Ohio Consent Decree may produce additional F-listed RCRA hazardous waste as well as contaminated media which contains F-listed RCRA-hazardous waste. The future Ohio Consent Decree cleanup actions could result in the excavation of additional contaminated soil and associated wastes to meet final environmental-media cleanup levels established for the deferred SWMUs as part of the Ohio Consent Decree decisions. The future Ohio Consent Decree decisions could also separately contemplate disposal of that soil in a potential OSDC, if one is available from the DFF&O decisions. While most of the soil and associated wastes produced from the Ohio Consent Decree decisions would not be anticipated to be RCRA-hazardous based on characteristic properties, there is the potential for the soil and

---

[3] All costs in this paragraph are net present value costs in 2013 base year dollars developed to support the PORTS life-cycle baseline.

associated wastes to either contain F-listed RCRA-hazardous waste or be F-listed RCRA-hazardous waste.

In view of the potential for producing RCRA-hazardous wastes during cleanup as described above, there are two elements of the CAMU rule that can be used to facilitate the implementation of a reliable, effective, protective, and cost-effective remedy at PORTS. The first is the ability to identify PHCs and to focus treatment on these constituents alone. When evaluating treatment of characteristic hazardous waste according to the land disposal restrictions (LDRs), there would be a need to identify all underlying hazardous constituents and also treat any of them that are above 10 times the Universal Treatment Standard. Underlying hazardous constituents do not apply to RCRA-listed waste. The industrial processes at PORTS resulted in a number of different types of environmental contamination including metals, polychlorinated biphenyls, volatile and semi-volatile organics, pesticides, and radioactivity. A considerable addition to sampling costs would occur in order to identify and confirm treatment of underlying hazardous constituents for any RCRA-characteristic wastes. But mostly, the need to consider treatment for several contaminants on varying types of waste streams would lead to such an excessive burden that lower levels of contamination would likely be left in the ground with a reliance on long-term containment and institutional controls. Also, if there is no other choice but to dispose of this material on Site (such as if D&D hazardous waste can no longer be sent off Site), the excessive sampling and treatment requirements would result in an expenditure of limited funds with no benefit.

Secondly, the CAMU rules provide for flexibility when setting treatment standards. The purpose of this flexibility is to recognize the environmental benefits associated with excavation and disposal of contamination that is in the environment and to not offset these benefits with required treatment efforts that do not provide any additional benefits.

Under LDR requirements, if the landfills and contaminated groundwater soil are excavated to be used as fill, it is likely that additional treatment methodologies other than dewatering (required to meet a potential OSDC WAC) would be needed to meet required treatment standards. Such additional treatment options can be $10 million or higher with the additional cost increases associated with delay of D&D activities (see Appendix E), quickly decreasing the cost benefit that use of this material as fill provides DOE, the environment, and the community and decreasing the cost-effectiveness of any future excavation remediation alternatives that are considered. For remaining environmental contamination that is not used as fill, there are still future remediation decisions that are needed. Cost-effective excavation options ensure that more of this contamination is removed from the environment than remains under future controls. And for potential future D&D waste streams that can no longer be sent off Site, the use of treatment would use funds that could be spent providing more benefit to human health or the environment.

Although the current LDRs do allow for treatment standard variances, these variances must be granted by the EPA Administrator before the Ohio EPA Director will recognize them. However, the LDR regulations are more rigid as compared to the flexibilities made available under the CAMU rule. Additionally, the criteria for such LDR variances are not clearly defined. A CAMU would permit a deviation from those levels to allow a more timely, effective, and cost-effective disposal while nevertheless remaining protective (see discussion of *OAC* 3745-57-72 (E)(4)(d) and (e) *infra*). Deviations from treatment levels ensure that future decisions concerning remaining environmental contamination or D&D waste have cost-effective excavation and disposal options available for consideration.

The location of a potential OSDC is outside of areas of most likely future redevelopment. As shown in Figure 2, the potential OSDC is located to the northeast of the industrial facility. It is also proposed to be located over very competent bedrock, greatly decreasing any chance of contamination leaching from the bottom of the treatment, storage, and disposal CAMU. Under the CAMU regulations, the flexibility of the treatment requirements would support cost-effective disposal of waste or use of contaminated fill, increasing the extent of consolidation of contamination into the CAMU. This increase in consolidation would lessen the restrictions on future use of the land within the industrialized portion of the Facility, decreasing DOE's long-term liability and increasing future reuse opportunities.

2) *The management of waste at the designated CAMU will not create unacceptable risk to human health or the environment resulting from exposure to hazardous wastes or hazardous waste constituents.*

"*Since CAMUs are likely to increase the amounts of waste that are remediated, this provision is intended to ensure that remediation waste management activities are conducted so as to control short-term risks that could potentially occur from remedial activities.*" (58 FR 8658, February 16, 1993). As noted in Criterion 1, EPA is not requiring a quantitative risk assessment of the short-term risks associated with a CAMU designation.

Regardless of its CAMU designation, a potential OSDC would need to be built if Alternative 2 is selected. Designating the potential OSDC as a CAMU provides the opportunity that contaminated fill could be used cost-effectively in the operations of a potential OSDC. Therefore, this criterion evaluates the short-term risks associated with construction and operation of a potential OSDC, as well as the impact designating the disposal facility as a CAMU and increasing the opportunity to use contaminated fill would have on those risks.

As described in the short-term effectiveness criteria evaluation in the Waste Disposition RI/FS and summarized here, disposal of waste in a potential OSDC would not create unacceptable risk to human health or the environment. Additionally, none of the short-term effectiveness criteria, as described below, would be negatively impacted by designating the potential OSDC as a CAMU.

Protection of the Community during Remedial Action
DOE has employed rigorous design and operations standards to mitigate potential risk to the public from the presence of a potential OSDC, transportation of hazardous and radioactive waste, operation of a potential OSDC, and windborne dispersion of contaminants. Risk to the public from waste handling and disposal activities at PORTS would be low because of the robust and conservative protective systems supporting all phases of operation. Public access would be restricted at any disposal facilities and at all waste generation, packaging, and handling locations. Selection of appropriate transport routes; compliance with U.S. Department of Transportation (DOT) packaging and other requirements; and adherence to project-specific transportation safety and spill plans would minimize the likelihood of an accident and the severity of a release should an accident occur.

Establishing CAMUs at PORTS would substantially reduce the impact of D&D project-related vehicle traffic on public roadways, since fill would be generated within the PORTS Perimeter Road rather than generated at off-site locations for transport to PORTS. Appendix H to the Waste Disposition RI/FS provided an engineered fill source evaluation for the potential OSDC that compared three principal sources of engineered fill for constructing the potential OSDC: off-site clean fill sources, PORTS clean fill sources, and PORTS contaminated fill sources. (As described in the preamble, the term "engineered fill" or "fill" refers to any material, clean or contaminated, used to fill in void spaces in waste.) Based on the evaluation contained in Appendix H, the Waste Disposition RI/FS adopted the use of contaminated fill from PORTS sources as the representative process option for fill for inclusion in Alternative 2.

Irrespective of which source of fill is used to construct the potential OSDC, it would take approximately 221,000 individual truckload shipments to transport the needed fill materials to the new potential OSDC to support construction activities and satisfy the 2.65 million cy fill demand. This would average to about 35 to 40 trucks each and every working day, over a 25-year construction period. If off-site sources of clean fill are used to satisfy the demand, the 35 to 40 trucks per day truck traffic would need to travel local routes through the neighboring communities. Assuming the local clean sources are within a 5-mile radius of PORTS (with a 10-mile per round trip average distance), this would equate to about 2.2 million road miles of additional traffic over local public highways to satisfy the extensive multi-decade fill demand. However, if contaminated fill can be cost-effectively used to support operations at a CAMU, the truck traffic would remain on PORTS, not impacting the surrounding community.

During construction and operations, DOE would control emissions of fugitive dust to ensure protection of human health and the environment in adherence with ARARs. These actions would minimize community exposure to fugitive dust generated by construction of a potential OSDC and exposure to contaminants from the dispersion of waste by high winds during operation. During construction and operation, fugitive dust generation and other airborne emissions would be monitored. Engineering controls, such as the application of water or chemical dust suppressants and seeding of spoil piles and exposed soils, would be implemented to minimize fugitive dust emissions beyond the facility boundary.

Protection of Workers during Remedial Action

The primary risks to workers from construction of an OSDC and waste handling, transportation, and disposal activities are exposure to contaminants, heavy equipment accidents, and transportation accidents. DOE has thorough health and safety protocols to minimize risks during D&D activities. These activities would be conducted by trained personnel in accordance with ARARs/to-be-considered (guidances), DOT regulations, DOE requirements, approved health and safety plans, and as low as reasonably achievable principles. Risk from exposure during disposal activities would be generally limited because the waste would meet a potential OSDC's WAC, which would include components for worker safety (developed during the design). Worker exposure would be further minimized by compliance with DOT and DOE waste packaging, transport, and handling requirements; the use of shielding and personnel protective equipment (PPE); limits on driver work schedules; and other operational restrictions, such as spacing and distancing, to ensure that radiation doses to workers are kept below 5,000 mrem/year. Therefore, the overall risk to workers from constructing and operating a potential OSDC is low.

Designating the potential OSDC as a CAMU should not notably increase risk to workers. Although there is the potential for an increase in accidents as a result of excavating contaminated soil and landfills as sources of fill, these risks can be adequately mitigated by standard health and safety protocols. DOE has excavated other landfills across the complex successfully. Additionally, with more flexibility granted to treatment standards, there is the potential that fewer treatment activities may be needed or less waste would need to be sent off Site, decreasing the potential exposure to radionuclides and other contaminants to workers involved in the treatment, additional handling, or long-haul transportation activities which offsets the increased risk from excavating and transporting contaminated soil and landfills.

Short-term Environmental Effects
The potential for short-term environmental impacts from the construction and operation of the potential OSDC would be posed primarily by construction activities, spills during transportation and handling of wastes or leachate, releases during decontamination operations, other operational releases, and potential OSDC capping activities. Short-term environmental impacts would be minimized by use of best management practices, including engineered and administrative controls.

The short-term environmental risk from transportation would arise primarily from the potential for spills during waste shipment and impacts to air quality resulting from commuter, construction and operations traffic. Adverse environmental impacts in the event of a spill during waste transport would be minimal because wastes would not be in liquid form, waste volumes per shipment would be small, contaminant concentrations would be low for most waste streams, waste would be properly packaged, and spill plans would be quickly implemented if a spill occurred. Safeguards would be implemented to ensure protectiveness during waste transport. Leachate would be conveyed in piping, with secondary containment where releases are possible. Impacts to air quality, surface water resources, and groundwater are discussed below.

Air quality. Impacts to air quality from the construction and operation of a potential OSDC would result from the increase in generation of fugitive dust by earthmoving activities such as during construction. During construction and operation, there would be significant earthmoving activities at the cell. A number of large trucks, including tractor-trailer rigs, large dump trucks, and excavation equipment, would deliver soil and waste daily. The peak level of particulate emissions would be expected during the first 2 years of construction, when the majority of land clearing and fill activities take place. Clearing of land and construction of a potential OSDC and support facilities may result in fugitive dust being visible at facility boundaries. Operations at the potential OSDC or at an IMTA may release some contaminants into the air, but compliance with ARARs, such as Ohio EPA fugitive dust limits would ensure compliance with federal National Ambient Air Quality Standards. Engineering controls, such as the application of water or chemical dust suppressants and seeding of spoil piles and exposed soils, could be implemented to minimize fugitive dust emissions.

Designation of the potential OSDC as a CAMU would not increase the impacts to air quality beyond the discussion above for the potential OSDC. Although there may be a limited release of volatile compounds during the excavation of contaminated fill, there is also less treatment required for residual soil, thereby reducing the air releases from treatment of this D&D waste. During the 2011 X-701B Interim Remedial Measure excavation action, which is a similar excavation action to that being proposed, DOE used air emission controls and calculated releases within the area. Based on that experience, with appropriate controls, the worst case average daily TCE concentration can be maintained at less than one-third of the Ohio EPA de minimus levels for air emissions as set under *OAC* 3745-15-05(B).

Surface water resources. A total of 14,335 linear ft of streams (Class I, II, and IIIA) would be directly impacted by construction of a potential OSDC and supporting infrastructure while additional lengths could be indirectly impacted from changes in water quality or quantity. Roughly 0.11 acres of wetlands would be directly affected with another 2 acres of wetlands in Study Area D having the potential for impact during construction activities. DOE is evaluating impacts of the proposed actions for potential adverse effects to streams and wetlands and is developing potential mitigation measures for any adverse effects where avoidance or minimization is not practicable.

Upon closure of the OSDC, much of the area would be recontoured for drainage following removal of requisite infrastructure, except for the area beneath the OSDC footprint.

Potential impacts to surface water resources could result from sediment loading to surface water bodies or migration of contaminants. Land clearing and construction activities would expose varying areas, depending on the location selected and the ultimate size of the facility. The potential impacts to surface water resources would be minimized by using standard erosion controls, such as siltation fences and buffer zones of natural riparian vegetation, during construction activities.

Potentially contaminated runoff from a potential OSDC, water used for decontamination, water from the leachate detection/collection system, contaminated runoff from an IMTA during storage, size reduction, or decontamination efforts, and other wastewater would be collected in storage tanks. This water would be sampled and conveyed to an appropriate treatment facility, as required. The potential for impact to surface water resources from migration of contaminants from a potential OSDC in groundwater would be exceedingly low because of engineered and active controls.

Potential impacts to surface water would be minimized by only constructing the portions of a potential OSDC that are planned to be used in the immediate future. By not having the entire disposal facility open at one time, the amount of disturbed area would be minimized.

Designation of the potential OSDC as a CAMU and the resultant opportunity to use contaminated fill could have a greater impact on surface water quality in the near term over that impacted by the construction of the potential OSDC using clean fill alone. Excavation of contaminated landfills and plume areas for use as fill could have an impact on other streams or wetlands in the area. Streams may need to be diverted temporarily and some wetlands may be destroyed. Any impacts to the streams or wetlands resulting from this excavation of contaminated fill would be mitigated in accordance with ARARs. However, in the long term, the consolidation of this contamination in the fill into an engineered disposal facility would limit future migration potential of contamination to surface water bodies from runoff, erosion, or discharge from underlying groundwater contamination, thereby improving surface water quality.

Groundwater resources. During OSDC construction, there may potentially be minor releases of contamination to the environment. Contaminant sources include spills of D&D waste, spills of oil and diesel fuel, releases from transportation or waste handling accidents, and accidental releases of leachate from the disposal cell. However, compliance with an approved Erosion and Sedimentation Control Plan and a spill plan would mitigate potential impacts from surface spills. Engineered controls and active controls, including the leachate collection system, would reduce the potential for impact to groundwater resources that could result from contaminant migration during construction and operation of the disposal cell.

The designation of a potential OSDC as a CAMU and the resultant opportunity for use of contaminated fill would result in improvements to groundwater resources. In the event that contaminated soil were used as fill, the primary and secondary continuing sources of groundwater contamination would be removed from the environment and placed in an engineered facility. The overall time and cost required to meet remediation objectives for groundwater would be significantly reduced; therefore, contaminated groundwater would be beneficially impacted by the designation of a potential OSDC as a CAMU.

3) *The CAMU includes uncontaminated areas of PORTS only to the extent inclusion of such areas is more protective than managing the waste at contaminated areas.*

EPA intended for this criterion to "*… ensure that any land area of a facility that is not already contaminated … will be included within a CAMU only if remediation waste management at such an area will … be more protective than management of such wastes at contaminated areas of the facility.*" (58 FR 8658, February 16, 1993).

Four locations were evaluated for siting a potential OSDC (treatment, storage, and disposal CAMU). More detail on the conditions of each of the locations can be found in Appendix D of the Waste Disposition RI/FS. Three of the locations, Study Areas A, C, and D were located in uncontaminated areas and Study Area B was located in a contaminated area. Any properly designed OSDC would be considered protective of human health and the environment because of the design of the impermeable cap and liner systems. However, within the compliance timeframe of 1,000 years or longer, the natural hydrogeologic conditions at each location must be further analyzed in differentiating the degree of protectiveness of the different study areas. Hydrogeologic conditions at each location determine the depth and migration (direction and rate) of groundwater. In the event contaminants migrate through the liner over time, the fate and transport of those contaminants will depend on the hydrogeologic and geochemical conditions of the underlying strata. While a shallow groundwater zone may exist within the regolith and weathered/jointed bedrock, most of this zone would be removed during construction of a potential OSDC. Table 1 provides a comparison of the protectiveness of each of the study areas relative to each other.

Table 1. Comparison of Protectiveness at Each Study Area

Criteria	Study Area A	Study Area B	Study Area C	Study Area D
Hydrogeologic Conditions	Study Area A overlies the ancestral river valley with the Gallia sand aquifer. Groundwater moves through the sand towards nearby surface water discharge in Big Run Creek. Minford water table is approximately 15 ft below surface.	Study Area B, similar to Study Area A, overlies the ancestral river valley with the Gallia sand aquifer. Groundwater moves through the sand towards nearby surface water discharge in Little Beaver Creek. Minford water table is less than 15 ft below surface.	Study Area C is underlain by low permeability bedrock. The uppermost aquifer at this study area, the Berea sandstone, is overlain by more than 100 ft of low permeability Cuyahoga and Sunbury shale.	Study Area D is similar to Study Area C in that it is underlain by low permeability bedrock. The uppermost aquifer at this study area, the Berea sandstone, is overlain by up to 100 ft of low permeability Cuyahoga and Sunbury shale.
Contaminant Fate and Transport	pWAC modeling indicated Study Area A had travel times to reach peak dose similar to Study Area B (a few organic compounds reached the point of exposure in less than 1,000 years).	pWAC modeling indicated Study Area B had the fastest travel times to reach peak dose compared to the other locations (a few organic compounds reached the point of exposure in less than 1,000 years).	pWAC modeling indicated Study Area C had travel times to reach peak dose several times longer than either Study Areas A or B. No constituents reached peak dose in less than 1,000 years and many constituents took more than 150,000 years.	pWAC modeling indicated Study Area D travel times to reach peak dose several times longer than either Study Areas A or B. No constituents reached peak dose in less than 1,000 years and many constituents took more than 150,000 years.

Table 1. Comparison of Protectiveness at Each Study Area (Continued)

Criteria	Study Area A	Study Area B	Study Area C	Study Area D
Protectiveness Compared to Other Study Areas	Similar protectiveness as Study Area B; less protective than Study Areas C and D	Similar protectiveness as Study Area A; less protective than Study Areas C and D	Similar protectiveness as Study Area D; more protective than Study Areas A and B	Similar protectiveness as Study Area C; more protective than Study Areas A and B

DOE = U.S. Department of Energy
RI/FS = remedial investigation/feasibility study
pWAC = preliminary waste acceptance criteria (model results reported in the waste disposition RI/FS Work Plan [DOE 2012])

Based on the above analysis, which is detailed in Appendix D of the Waste Disposition RI/FS, Study Areas C and D are more protective of human health and the environment than Study Areas A and B; therefore, Study Areas A and B were eliminated from further consideration in the context of the siting study. The contaminated area (Study Area B) had one of the least protective siting conditions.

Based on the overwhelming benefits offered by the underlying geology and on the best compliance with Ohio EPA siting criteria, Study Area D was selected as the representative location for a potential OSDC in the Waste Disposition RI/FS. All of these beneficial factors are discussed in full detail in Appendix D of the RI/FS. Highlights of the beneficial factors discussed in Appendix D include the following:

- Located on geotechnically stable ground, situated at a high point on PORTS
- Drainage is away from the area, not onto the area, decreasing the clean water that must be handled
- Underlain entirely by 100 ft or more of competent shale bedrock with low permeability
- Located 100 ft or more above the local groundwater table
- No significant pathway to the regional aquifer in the Berea Sandstone Formation
- Sufficiently large footprint to provide the needed capacity
- Not located in an area requiring major D&D and soil remediation activities, thereby allowing early construction of a potential OSDC with minimal coordination with D&D or remediation required.

Although Study Area D requires a commitment of uncontaminated land for long-term disposal, it is still preferable when compared to the contaminated area available at PORTS. The only contaminated area potentially available that could be suitable (Study Area B) has the following undesirable drawbacks: existing facilities that would require demolition prior to construction of a disposal cell, a shallow groundwater table, and WAC development modeling that has indicated that contaminants would migrate readily to the groundwater should the liner fail.

In addition to the siting and geological benefits discussed above, locating the potential OSDC in Study Area D and outside of the area of interest for reuse also supports the future reindustrialization objective of the local community, which is an added benefit for consideration in locating the potential OSDC.

Study Area D will be adopted as the location for the potential OSDC through the Waste Disposition ROD if Alternative 2 is selected. That decision will commit the uncontaminated land associated with the potential OSDC for long-term disposal. Designating the potential OSDC as a CAMU does not incrementally increase the extent of uncontaminated area impacted by long-term disposal beyond that already committed by Alternative 2 in the absence of a CAMU. Additionally, there is the potential for decreasing areas of contamination elsewhere at PORTS by using contaminated fill at the potential OSDC.

4) *Wastes in the CAMU that remain after closure would be managed and contained to minimize future release, to the extent practicable.*

EPA intended this criterion to "*… consider… whether long-term reliability and effectiveness will be ensured through the implementation of a CAMU, particularly when it is necessary to leave waste in place after implementation of remedial activities.*" (58 FR 8658, February 16, 1993). The long-term (i.e., post-closure) reliability and effectiveness of CAMU-related actions must be considered.

As described in the long-term effectiveness criteria evaluation in the Waste Disposition RI/FS and summarized here, disposal of waste in a potential OSDC that is designated as a CAMU would not create unacceptable risk to human health or the environment post-closure. As discussed below, the same robust geologic and engineering factors that make the potential OSDC effective would not be negatively impacted by the designation of the potential OSDC as a CAMU. Designating the potential OSDC as a CAMU enhances the opportunity for contaminated fill to be used for waste placement and removes the contaminated material from the environment from where it is presently located. Because of the robust engineering and geologic factors for the potential OSDC, use of contaminated fill would be protective of human health and the environment.

The siting and engineering elements considered for a potential OSDC are focused on developing a disposal option that minimizes future contaminant releases both during operations and after closure. The modeled WAC analysis conducted for the Waste Disposition RI/FS demonstrated limited mobility of potential contaminants from the bottom of a potential OSDC because the preferred location is over competent bedrock. The liner and cover designs included in the intermediate design package exceed the regulatory requirements for a treatment, storage and disposal CAMU, as summarized in Table 2. Design of the leachate collection system to be submitted to Ohio EPA will contain the features detailed in Table 2. The groundwater monitoring and post-closure care elements to be specified in the final design package would also meet the requirements.

Table 2. OSDC Intermediate Design Summary

Design Element	CAMU Requirements	Potential OSDC Design
Liner	1) Composite liner consisting of: - An upper FML with a minimum thickness of 60 mil for HDPE or 30 mil for all other FMLs that is installed in direct and uniform contact with the lower compacted soil component. - A lower component consisting of at least a 2-ft layer of compacted soil with a hydraulic conductivity of no more than 1×10^{-7} cm/s.	1) Double liner and leachate collection system consisting of: (a) a composite liner consisting of a 3-ft compacted low-permeability soil with a permeability of 10^{-7} cm/s, a geo-composite (bentonite) liner, and a 80-mil HDPE geomembrane, and (b) an upper liner of an 80-mil HDPE geomembrane, a geo-composite (bentonite) liner, and a leak detection layer consisting of geotextile, 1 ft of drainage gravel, and a perforated pipe. The components of the potential OSDC design meet or exceed the design requirements of a RCRA Subtitle C-type liner and would not be affected by the CAMU regulations.
	2) Leachate collection system that maintains less than a 30-cm (12-in.) depth of leachate over the liner (40 *CFR* 264.552[e][3], *OAC* 3745-57-72 [E][3][a])	2) Leachate collection system consisting of 1 ft of drainage gravel, leachate collection pipes, and geotextile maintains less than 30-cm depth of leachate over the liner.
Cap	CAMUs with constituent concentrations above remedial levels or goals applicable to PORTS; cover the CAMU with a final cover designed and constructed to meet the five performance criteria: - Provide long-term minimization of migration of liquids through the closed unit - Function with minimum maintenance - Promote drainage and minimize erosion or abrasion of the cover - Accommodate settling and subsidence so that the cover's integrity is maintained - Have a permeability less than or equal to the permeability of any bottom liner system or natural subsoils present. (40 *CFR* 264.552[e][6][iv], *OAC* 3745-57-72[E][6][d][i])	A potential OSDC design includes a 9-ft final cap over the entire facility consisting of a contouring layer over the waste, a 2-ft low permeability compacted clay layer, a geo-composite (bentonite) liner, an 80-mil HDPE geomembrane, geotextile protective layer, a 1-ft cover drainage layer, a 3-ft bio-intrusion barrier, a 0.25-ft chock stone layer, a 0.5-ft granular filter layer, a 1.5-ft vegetative soil layer, a 1-ft top soil layer, and a vegetative cover with native grass. This design is more than required by the RCRA Subtitle C-type cap design requirements. The components of the potential OSDC design meet or exceed the design requirements of a RCRA Subtitle C-type cap and would not be affected by the CAMU regulations. The impermeable geomembrane layer within the cap would provide equal initial permeability to the bottom liner system. Both systems rely on geomembrane layers to provide practically impermeable barriers of water. The cap could also be repaired or replaced if necessary in the future, unlike the bottom liner system for which repair or replacement would not be practical or even possible. Therefore, the cap would be able to maintain longer term low permeability beyond the time frame expected for the bottom liner system.

Table 2. OSDC Intermediate Design Summary (Continued)

Design Element	CAMU Requirements	Potential OSDC Design
Monitoring	1) Continue to detect and to characterize the nature, extent, concentration, direction and movement of existing releases of hazardous constituents in ground water from sources located within the CAMU; and 2) Detect and subsequently characterize releases of hazardous constituents to groundwater that may occur from areas of the CAMU in which wastes will remain in place after closure of the CAMU; and 3) Require notification to the Director and corrective action as necessary to protect human health and the environment for releases to groundwater from the CAMU.	There is no existing release of hazardous constituents in groundwater from sources located within the proposed OSDC footprint. OSDC groundwater monitoring for each cell would consist of up-gradient and down-gradient wells installed in clusters or nested to monitor three different elevations: the Berea Formation, the 680-sandstone layer (in the Cuyahoga Formation), and the 720-sandstone layer (in the Cuyahoga Formation). Lateral monitoring points directly under the lowest point of each cell liner system would also be installed. A potential OSDC groundwater monitoring plan would require Ohio EPA notification of any releases. The groundwater monitoring plan would state that a corrective action plan would be submitted to Ohio EPA for review/concurrence, as necessary, to ensure protection human health and the environment.
Closure and Post-closure	Control, minimize or eliminate, to the extent necessary to protect human health and the environment, for areas where wastes remain in place, post-closure escape of hazardous wastes, hazardous constituents, leachate, contaminated runoff, or hazardous waste decomposition products to the ground, to surface waters, or to the atmosphere.	The potential OSDC design would minimize the need for further maintenance; and control, minimize or eliminate, to the extent necessary to protect human health and the environment, for areas where wastes remain in place, post-closure escape of hazardous wastes, hazardous constituents, leachate, contaminated runoff, or hazardous waste decomposition products to the ground, to surface waters, or to the atmosphere. This would be achieved by siting of the facility at the best geological and hydrogeological location at PORTS and incorporating the best design approach and construction materials available for long-term containment of hazardous and other wastes to be generated during D&D and environmental remediation at PORTS.

CAMU = Corrective Action Management Unit
CFR = Code of Federal Regulations
D&D = decontamination and decommissioning
FML = flexible membrane liner
HDPE = high-density polyethylene
OAC = Ohio Administrative Code
Ohio EPA = Ohio Environmental Protection Agency
OSDC = on-Site disposal cell
PORTS = Portsmouth Gaseous Diffusion Plant
RCRA = Resource Conservation and Recovery Act of 1976, as amended

CAMU-eligible wastes, treated as appropriate, would be placed in a potential OSDC designed to isolate waste from the environment and significantly reduce the possibility of intrusion into the waste cell or migration of contaminants away from the facility, representing an overall collective decrease in residual risk. By design, meeting the facility WAC would ensure that the total excess lifetime cancer risk (ELCR) from the cell would be less than 1×10^{-5}, the total noncarcinogenic risk hazard index would be less than 1 to future residents living adjacent to the facility, and the underlying groundwater would be protected by ensuring maximum contaminant levels are not exceeded.

Modeling to support draft modeled WAC selection illustrates that Study Area D has geologic characteristics that, in concert with the engineering design, do not allow for contaminants at unacceptable levels to migrate from the cell to beyond the waste boundary within a period of 1,000 years, assuming that the facility performs according to projections (Appendix I of the Waste Disposition RI/FS). Because the input parameters used for these calculations were based on the assumption that man-made materials would fail and are likely to overestimate actual future risks from disposed waste, the modeled results are inherently conservative.

Engineered controls would be built into a potential OSDC to prevent exposure to contaminants and to prevent, detect and mitigate contaminant releases. The flexible membrane liner and geosynthetic clay liner components of the primary liner would control releases of leachate to groundwater for their design life, which is at least 200 years. The active leachate collection system above the primary liner and the leak detection system below would be effective until the volume of leachate generated is minimal and stable. Long-term control of leachate release would be provided by the secondary liner and geologic buffer and the passive leachate treatment system; these controls would last at least for their design life. An assessment was conducted to estimate the impact on adjacent surface water bodies if the leachate collection or treatment system were to fail and leachate were released directly into the environment. An estimated curie content in the waste in the cell, a TCE mass, and an estimated flow of future leachate (after capping) were used to estimate a concentration of contaminants in the leachate that could be released untreated from a potential OSDC. The entire volume of leachate was then assumed to directly discharge to Little Beaver Creek. Resultant estimated concentrations (see Appendix K of the Waste Disposition RI/FS for method and results) were significantly below recreational risk-based levels, and no impact to the surface water quality would occur, even under a failure scenario.

The disposal cell cap would prevent airborne releases and direct contact with or exposure to the waste or any contaminated fill. The thickness of the cap (10 ft) and the presence of the biointrusion layer would discourage inadvertent penetration by humans and would prevent or minimize damage from burrowing animals and tree roots. The disposal cell and cap would be designed to remain stable under expected environmental conditions, including possible erosion and earthquakes, for the foreseeable future. Aside from intentional human disturbance or major global climate changes, no credible scenarios for exposing human or ecological receptors to the waste have been identified.

Institutional controls would prevent access to the on-Site disposal facility and use of local groundwater. Institutional controls would continue for an indefinite period, and land use restrictions would be permanent. Monitoring to determine the effectiveness of the primary controls would continue indefinitely.

The final cap is designed to resist erosion with minimal maintenance, and only extensive erosion would breach containment. Surveillance and maintenance of the cap, however, is planned to stop erosions before they could become extensive.

5) *The CAMU expedites the timing of remedial activity implementation.*

EPA has stated a preference to use CAMUs if they will expedite the timing of remedy implementation by eliminating unnecessary delays. EPA states though that CAMUs may not always result in remedies that take less time, so EPA "*… only requires that a CAMU expedite remedial time frames when it is appropriate and practicable, in consideration of the other remedial objectives for the facility.*" (58 FR 8658, February 16, 1993).

Designation of a disposal CAMU and providing relief from LDR requirements at PORTS beneficially affects timing in two ways when considering other remedial objectives of the facility:

1) Provides fill when needed at the generation rate required to support the pace of D&D waste generation. This prevents the D&D schedule from being impacted by a lack of fill.

2) Groundwater restoration time is significantly decreased by decades because the primary and secondary sources of contamination can be removed from the environment during the generation of that fill.

Designating a potential OSDC as a CAMU provides the opportunity to select other protective treatment standards for RCRA-hazardous constituents. Initial estimates in Appendix E (Section E.1.5) suggest that the selection of other protective and appropriate treatment standards may save $10 million and 2 years of effort. Because the competent bedrock and engineering design of a potential OSDC at PORTS can mitigate additional handling requirements for contaminated media that may be used as OSDC fill, there is an opportunity to expedite the generation of OSDC fill. Lower costs associated with handling fill allows available funds to be used for increasing the protective state of PORTS by focusing efforts on excavation, D&D, and disposal actions thereby expediting removal of significant contamination from the environment.

If soil contaminated from groundwater contamination is excavated and used as fill, there is expected to be a shorter time required for final groundwater remediation efforts as the major secondary source of groundwater contamination would be consolidated in a potential OSDC. By removing the source, improving the ability to extract groundwater, and reducing the need for active groundwater restoration, schedule savings could be as high as several hundred years.

6) *The CAMU uses, to the extent appropriate, treatment to reduce the toxicity, mobility or volume of waste remaining after closure of the CAMU.*

EPA intended this criterion to require, as appropriate, the use of "*… treatment technologies (including innovative technologies) to enhance long-term effectiveness of remedial actions at the facility by reducing the toxicity, mobility, or volume of waste that remains after closure of the CAMU.*" This criterion is analogous to the preference under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 for treatment-based remedies. EPA has clarified that "*…this criterion does not preclude remedial actions that do not employ treatment, as long as they are capable of ensuring long-term effectiveness.*" (58 FR 8658, February 16, 1993). EPA provides an example that in a situation involving large volumes of low concentration contaminated soils or other wastes, there is the discretion to evaluate containment-based remedial approaches.

Technical appropriateness is also used in one of EPA's definitions of technical impracticability. Technical impracticability is defined to include technical infeasibility or inordinately costly from the National Contingency Plan and unachievable and technically inappropriate under the RCRA LDR treatment standard requirements (67 FR 2962, January 22, 2002).

In general, PORTS has large volumes (over 1 million cy) of low-concentration contaminated waste. Additionally, the waste takes many forms (building materials, soil, concrete, etc.). In these conditions, the use of final containment instead of many different treatment technologies is more cost-effective. The Waste Disposition RI/FS concluded that disposal was the only viable final alternative for this waste. However, there is likely to be some treatment needed to meet the WAC of a potential OSDC. In particular, dewatering of saturated soil and other waste is needed to avoid placement of free liquids in the cell. The water that is separated would then be treated in the existing groundwater treatment facilities and/or supplemented with additional systems, reducing the volume and mobility of the contaminants (primarily anticipated to be volatile organic compounds). At this time, no other treatment technologies are anticipated to be used, but if other PHCs are identified, additional treatment options may be used.

7) *The CAMU, to the extent practicable, minimizes the land area of the facility upon which wastes will remain in place after closure of the CAMU.*

   EPA intends, through this criterion, to "*… promote consolidation of remediation wastes into smaller discrete areas of the facility, that are suitable as long-term repositories for the wastes, and which can be effectively managed and monitored over the long term.*" (58 FR 8658, February 16, 1993).

   To accommodate the estimated 5 million cy of potential capacity needed, an area roughly 100 acres in size would be dedicated to long-term disposal. The buildings and structures that would be demolished and disposed in the potential OSDC are primarily in the industrialized area of PORTS. The removal of the buildings and eventual remediation of the associated contaminated soil and underlying groundwater would consolidate roughly 1,000 acres of industrialized area where the sources of contamination are found into the 100-acre CAMU. In addition, roughly 30 acres of a total of 90 acres of landfills may also be consolidated into the CAMU by using the associated soils as fill.

Designation of the Storage and/or Treatment CAMU

CAMUs that are used for storage and/or treatment only and do not exceed the staging pile time limits (2 years) are subject to the performance criteria and design, operating, and closure standards for staging piles as defined in *OAC* 3745-57-74, which is an ARAR in the Waste Disposition RI/FS. They would not be subject to CAMU designation criteria nor the CAMU design, treatment, groundwater monitoring and corrective action, and closure requirements. However, those units for which the staging pile limits must be exceeded are subject to the CAMU rule which requires the establishment of time limits for operation that are no longer than necessary to achieve a timely remedy selected for the waste. These units also must comply with the design and operating requirements for CAMUs in which waste will remain after closure along with the performance criteria and design, operating and closure standards for staging piles as defined in *OAC* 3745-57-74.

A waste staging area, called the IMTA, would serve as a temporary storage area for incoming waste. This area would be used if the rate of incoming waste deliveries exceeds the rate of waste placement in the disposal facility, as could occur during inclement weather. It would also be used to stockpile waste to allow the most economical placement of waste requiring fill and waste that can be used as fill. The IMTA is assumed to be constructed of the following: 2-ft compacted base followed by a geotextile cushion, 80-mil geomembrane liner, geonet, geotextile fabric, and finally a 1-ft soil protective layer graded to drain. The 7-acre IMTA would be graded so water would flow by gravity to a sump pump system. The collected impacted water would be pumped to the interim leachate treatment system and be discharged when discharge limits are met.

The IMTA would contain waste throughout the operational life of the potential OSDC. That time frame cannot be established at this time but will take considerably longer than the staging pile limits of two years. DOE requests that the operational time limits for the storage and/or treatment CAMU be extended and tied to the operational time frame of the OSDC rather than an absolute duration. An operational time limit extension is also requested for all other CAMUs which are established under this authorization, due to the massive nature of this cleanup project and the extended time period for this cleanup (in excess of 30 years). The specific extension timeframes will be presented in design plans for each CAMU for approval/concurrence by Ohio EPA.

The IMTA will be designed and operated in accordance with all ARARs, including the CAMU rule.

IDENTIFICATION OF CAMU-ELIGIBLE WASTE STREAMS

EPA defines CAMU-eligible waste as "*[a]ll solid waste and hazardous wastes, and all media (including ground water, surface water, soils, and sediments) and debris that contain listed hazardous waste or that themselves exhibit a hazardous characteristic and are managed as part of the implementation of cleanup. As-generated waste (either hazardous or nonhazardous) from ongoing industrial operations at a site are not CAMU-eligible wastes.*" (67 FR 2962, January 22, 2002). As discussed in detail in the 1993 CAMU rule preamble, EPA clarified that "*the definition of remediation waste includes nonhazardous solid waste…[although] management of such wastes would not require the designation of a CAMU.*"

EPA also clarified that soil or other materials contaminated by product spills or releases from ongoing industrial operations are not considered as-generated waste and, as such, are CAMU-eligible when managed for implementing cleanup (67 FR 2962, January 22, 2002). However, EPA provides a provision to "kick out" certain otherwise CAMU-eligible waste streams where noncompliance with applicable RCRA regulations "likely contributed to the release of the waste". CAMU-eligible waste is not limited only to historical waste or contamination; waste generated during the cleanup of current releases is also considered CAMU-eligible. The cleanup of contaminated soils or similar materials is not considered by EPA to be an ongoing industrial process, even if the contamination itself derives from an ongoing industrial process.

EPA also clarified that closure of land-based units (e.g., landfills and surface impoundments) by removal to be "cleanup" for such permanent land disposal units (67 FR 2962, January 22, 2002). Therefore, waste removed from closed permanent land-based units are considered wastes "managed for implementing cleanup" and are CAMU-eligible. EPA indicated that management of containers (even if they are substantially intact) that are excavated from land-based units during the course of cleanup are allowed to be managed in a CAMU.

In addition to disallowing waste generated during ongoing industrial operations, EPA has prohibited management in a CAMU of wastes found during cleanup of intact or substantially intact containers, tanks, or other non-land-based units.

Appendix C presents the various known waste streams at PORTS and estimated volumes of these waste streams. The volumes are divided by the volumes estimated during the Waste Disposition RI/FS to be disposed on Site (in the CAMU) and those volumes estimated to be disposed off Site. Consistent with the definition of CAMU-eligible waste in the CAMU rule, building waste created under the DFF&O, which is considered to be waste generated during the implementation of a cleanup effort, is CAMU-eligible waste. These volumes are subject to change as remedial actions are implemented and more information is obtained. All waste that results from building demolition as part of the remediation of PORTS, contaminated soil or groundwater remediation, and landfill excavation is considered CAMU-eligible, whether or not it is a hazardous waste. PPE and other secondary waste streams (including leachate treatment wastes) are also considered CAMU-eligible as they are generated during remediation efforts and not during industrial operations. The waste at PORTS not considered to be CAMU-eligible would be hazardous waste stored in above-ground tanks and above-ground tank systems, cylinders, containers or other containment units. Therefore, all CAMU-eligible waste could be stored and/or treated at the potential IMTA and disposed at the potential OSDC.

Appendix C also presents the reasonably available information requested in the rule for each waste stream: (1) the origin of the waste and how it was subsequently managed (including a description of the timing and circumstance surrounding the disposal and/or release), (2) whether the waste was listed or identified as hazardous at the time of disposal and/or release, and (3) whether the waste was subject to the land disposal requirements of 40 *Code of Federal Regulations (CFR)* Part 268 at the time of disposal and/or release. This information has been gathered from the earlier RFI efforts, the Process Buildings and Complex Facilities D&D Evaluation Project (Process Buildings) RI/FS, and other previous environmental investigations.

The data which is evaluated within this supplement to the Waste Disposition RI/FS report for the proposed CAMU has been collected over the last 25 years under the oversight and approval of Ohio EPA and EPA. To place this in context, in response to the requirements of the 1989 Consent Decree, the EPA Administrative Order by Consent issued on September 29, 1989 (1989 Administrative Order by Consent), and amended on May 11, 1994 (1994 Administrative Order by Consent), and the Administrative Consent Order issued on August 11, 1997 (1997 Administrative Consent Order), which replaced the 1994 EPA Administrative Order by Consent, DOE has conducted numerous environmental investigations at PORTS. These investigations have resulted in reports, corrective action alternatives studies, implementation of interim measures, approved decision documents, and implementation of several corrective actions. The 1989 Consent Decree and the 1997 Administrative Consent Order specified that the investigation, study, and implementation of corrective actions should proceed in a phased approach that divides the facility into quadrants, which roughly correspond to distinct groundwater flow directions within the primary water-bearing unit beneath PORTS. The major documents prepared to satisfy some of the 1989 Consent Decree and 1997 Administrative Consent Order corrective action requirements are as follows:

- Quadrant I RFI Final Report (DOE 1996a)
- Quadrant II RFI Final Report (DOE 1996b)
- Quadrant III RFI Final Report (DOE 1996c)
- Quadrant IV RFI Final Report (DOE 1996d)
- Quadrant III Cleanup Alternatives Study (CAS)/Corrective Measures Study (CMS) Final Report (DOE 1998a)
- Quadrant IV CAS/CMS Final Report (DOE 1998b)
- Quadrant I CAS/CMS Final Report (DOE 2000)
- Quadrant II CAS/CMS Final Report (DOE 2001)
- Quadrant III Decision Document (Ohio EPA 1999a)
- Quadrant IV Decision Document (Ohio EPA 2000)
- Quadrant I Decision Document (Ohio EPA 2001)
- X-701B Decision Document (Ohio EPA 2003)
- X-734 Landfill Area Decision Document (Ohio EPA 1999b)
- X-749B (Peter Kiewit Landfill) Decision Document (Ohio EPA 1996a, EPA 1997)

- X-611A Decision Document (Ohio EPA 1996b, EPA 1996).

IDENTIFICATION OF PRINCIPAL HAZARDOUS CONSTITUENTS

Under the CAMU rule, PHCs must meet either minimum national treatment standards adapted from the LDR Phase IV soil treatment standards or, in specific circumstances, adjusted standards based on defined adjustment factors. The CAMU rule specifies that treatment standards would apply only to PHCs to be disposed in a storage, treatment, and disposal CAMU. Treatment standards and PHCs do not apply to storage and/or treatment only CAMUs such as the IMTA.

PHCs are defined as those constituents that "pose a risk to human health or the environment that is substantially higher than the cleanup levels or goals at the site." PHCs are selected from those constituents that would otherwise be subject to treatment under the RCRA LDR treatment standards for as-generated waste. In general, PHCs are identified as "*… carcinogens that pose a potential direct risk from ingestion or inhalation at the site at or above* 10^{-3}*; and non-carcinogens that pose a potential direct risk from ingestion or inhalation at the site an order of magnitude or greater over the reference dose.*" (67 FR 2962, January 22, 2002). EPA has also included the potential migration of constituents to groundwater as a pathway of concern for the identification of PHCs (67 FR 2962, January 22, 2002). PHCs are to be identified based on concentrations in the waste as initially managed, not after pre-treatment or other activity intended to reduce the concentration.

At PORTS, PHCs were identified from in situ soil sample results to avoid any inadvertent reduction in concentration that may occur during excavation and transportation. These samples represent the potential waste streams from both environmental remediation and from excavation of contaminated media to use as fill. Once the waste is excavated, there is the potential that levels of volatile organic compounds may be lower. The identification of PHCs is currently based on an extensive environmental database at PORTS collected over the last 25 years with Ohio EPA oversight. The PHC(s) identification process used in this document has clearly identified those PHC(s) at PORTS. Although there are additional data planned to be collected from environmental media at PORTS, it is very unlikely that a contaminant would be identified that meets the PHC definition that has not already been identified. However, although unlikely, if the next environmental media data collection effort should identify another constituent that could be of sufficient significance to meet the definition of a PHC, the following steps would be used to assess the potential presence of a new PHC. After that point in the characterization of environmental media at PORTS, there is no longer a sufficient management risk of future PHCs being identified and the PHC identification process for environmental media would no longer be necessary.

No PHCs were identified for D&D building demolition waste as the current plan is to remove all segregatable RCRA-hazardous wastes, regardless if CAMU-eligible or CAMU-ineligible, from the buildings before they are demolished, leaving only solid and low-level waste for the next phase of D&D. This waste would be sent off Site for disposal or recycling, as appropriate. As was discussed in Section 7.3 of the Process Buildings RI/FS, process knowledge, visual inspections, field data, and laboratory analytical results can all be used to answer questions during design and implementation of a remedial action. The end-state of the building after removal of RCRA-hazardous waste will be primarily assessed through process knowledge and visual inspection. Field and laboratory data can be used if determined necessary during the design and implementation of the remedy but the volume of any remaining non-segregatable hazardous waste (that does not require segregation) would be so low that by regulatory definition, the remaining D&D waste, considered as a universe, would be considered solid or low-level waste, therefore no PHC evaluation is needed because the waste is not considered hazardous. Residual soils that may be generated during subsurface demolition activities may contain TCE or other PHCs and will be evaluated. Should a decision on the disposal location change and DOE elect to send RCRA-hazardous waste from building D&D that was planned for off-Site disposal to the CAMU, an evaluation for 1) its CAMU-eligibility; and 2) for new PHCs associated with that waste would also be conducted.

The existing landfills inside Perimeter Road are one of the key potential sources of contaminated fill. Additional characterization specified in future plans would be conducted to support the excavation of the landfills and to determine WAC compliance of the material excavated. The new data and other information collected will be evaluated to determine CAMU-eligibility as well as if there are additional PHCs in the landfill waste.

The four steps that have been used and would be used in the future to identify PHCs in CAMU-eligible waste at PORTS are described below. The PHCs are those constituents that may require treatment prior to disposal in a CAMU.

1) First, a contaminant must be a hazardous constituent defined under *OAC* 3745-270 that would be subject to treatment standards for an as-generated waste. If a contaminant is not defined as a hazardous constituent, it is not a PHC.

2) Second, the maximum contaminant level present is compared to a risk-based screening level equating to a 1×10^{-3} ELCR through ingestion or inhalation (or a hazard quotient of 10 for non-carcinogenic compounds) for the potential future outdoor industrial user of PORTS in soil. The necessary values can be found in the most current PORTS Risk Methods Document that is available at the time of evaluation. (This document is updated semi-annually.) Appendix D presents the exposure assumptions and parameters used to calculate the risk-based screening level, also called a PHC threshold value. If that PHC threshold value is not exceeded, the contaminant is not a PHC.

3) Third, if the maximum value does exceed the PHC threshold value, either a qualitative or quantitative risk evaluation is done to conclude if the contaminant would cause an ELCR of 1×10^{-3} or a hazard quotient of 10 across an investigative area.

4) And finally, when risks to human health and the environment posed by the potential migration of constituents in wastes to groundwater are substantially higher than cleanup levels or goals at the site, these constituents may be designated as PHCs. Current concentrations of groundwater are used in this analysis instead of modeled results because typically the contaminants in the primary waste have been in the environment a sufficient amount of time that migration to groundwater has occurred if it were going to occur. The major contaminant in groundwater at PORTS is TCE. All other groundwater constituents result in notably less threat to human health. Therefore, the migration pathway to groundwater aspect of PHC identification would only evaluate TCE.

Appendix D presents the rationale for the PHC selection for PORTS. Based on the large amount of existing soil data collected under the Ohio Consent Decree investigation efforts since the early 1990s for over 100 potential contaminants at PORTS, providing nearly 400,000 analytical results, only TCE is currently identified as a PHC in environmental media. TCE is a PHC because (1) it would otherwise be subject to RCRA treatment standards due to the process by which it was used at the Facility (F-listed waste); (2) because the known soil concentrations at PORTS exceed the calculated 282 mg/kg PHC threshold value for TCE; (3) there are sufficient samples exceeding the level that are co-located, indicating that there is an elevated risk likely; and (4) TCE groundwater contamination results in human risk from groundwater use that is substantially higher than PORTS cleanup goals. Should future data collected for other purposes identify the potential that other contaminants may be PHCs, the same process would be conducted to evaluate these contaminants.

Table 3 presents the comparison of existing soil concentration values for PORTS compounds identified by Ohio EPA (during scoping meetings occurring after the Waste Disposition RI/FS) to their risk-based PHC threshold values.

Table 3. Screening Results for CAMU-eligible Soil – Chemicals of Potential Concern

COPC	Number of Results	Number of Detects	Number Above PHC Limit	Percent Above PHC Limit (%)	Minimum Detect (mg/kg)	Maximum Detect (mg/kg)	Outdoor Worker PHC Threshold Value[a] (mg/kg)
All Existing RFI Soil Data

Vinyl chloride	5,085	75	0	0	0.00061	1.7	2,240

Bold indicates a maximum value above the PHC threshold value.

[a] The outdoor worker PHC limits (except lead and elemental mercury) were obtained using the equations in the PORTS HHRA Risk Methods Document and the most recent 2014 EPA exposure parameters for body weight (80 kg), skin surface area (3,470 cm^2) and adherence factor (0.12 mg/cm^2). PHC limits for lead are based on the EPA soil screening level of 800 mg/kg. PHC limits for elemental mercury, for an outdoor worker, were obtained from Ohio EPA. The outdoor worker exposure scenario was selected to be consistent with the reasonably anticipated potential future use scenario.

COPC = chemical of potential concern

HHRA = Human Health Risk Assessment
Ohio EPA = Ohio Environmental Protection Agency
PHC = principal hazardous constituent
PORTS = Portsmouth Gaseous Diffusion Plant
RFI = Resource Conservation and Recovery Act of 1976, as amended, Facility Investigation

IDENTIFICATION OF TREATMENT STANDARDS

There are two provisions in the CAMU regulations that can be used to set treatment standards. PHCs must either meet treatment standards adapted from the LDR Phase IV alternative soil treatment standards under Section 3745-57-72(E)(4)(d) or, in specific circumstances, adjusted standards based on defined adjustment factors under Section 3745-57-72(E)(4)(e). EPA and Ohio EPA have developed a treatment standard of 90 percent reduction in concentrations of PHCs unless such treatment would result in concentrations that are less than 10 times the relevant Universal Treatment Standard, in which case treatment would be capped at 10 times the Universal Treatment Standard. EPA believes that this standard is appropriate and generally will result in meaningful treatment. But EPA also developed adjustment factors to result in adjusted standards; technical impracticability, consistency with site cleanup standard, community views, short-term risks, and protection offered by engineering controls under specified circumstances. When one or more of the adjustment factors are applied, EPA requires that the resulting adjusted standard be protective of human health and the environment.

This section uses eight major points to describe the process used to set an adjusted standard based on CAMU adjustment factors for TCE. If additional PHCs are identified in the future, a similar evaluation would be done for those contaminants to set either a treatment or adjusted standard.

Point 1
EPA has expressed no preference for using the treatment standard or the adjusted standard based on adjustment factors.

As stated in the final CAMU rule (67 FR 2962, January 22, 2002), "*EPA recognizes that the minimum treatment standards will often be the preferable approach … adjustments of the minimum treatment standards might be appropriate because they represent circumstances where failure to adjust treatment could result in discouraging aggressive cleanup*". EPA expressed that there is "*… neither a preference for nor against application of the factors*". Therefore, DOE considers both approaches for TCE and for any future PHCs and selects the approach that best represents the site-conditions and supports the most aggressive cleanup when setting treatment standards for PHCs.

Treatment Standard Evaluation

Point 2
A calculated 90 percent reduction in TCE concentrations results in an estimated concentration of 250 to 700 mg/kg, both in DFF&O-acknowledged residual soil and in non-DFF&O soil.

Currently, only TCE has been identified as a PHC. The waste (and contaminated fill, if used) that contains the TCE was evaluated initially using the 3745-57-72(E)(4)(d) provisions. Initial average concentrations of TCE in soil in the areas where TCE would be considered a PHC are approximately 2,500 to 7,000 mg/kg, resulting in a value of 250 to 700 mg/kg after consideration of a 90 percent reduction (See Appendix E, Figures E.1 through E.4).

Appendix E presents the information that was used to reach this conclusion. Both residual soil and non-DFF&O soil were evaluated site wide and found to yield similar results.

Point 3

Application of a treatment standard of 250 to 700 mg/kg to the universe of PORTS soil would require the use of treatment that is not considered cost-effective.

As a result of the WAC, free liquids must be removed from the waste prior to disposal. Some of the waste or contaminated fill that contains high levels of TCE is likely to have free liquids present, especially when the soil is below the groundwater table. Current data suggests that only soil in the X-700, X-701B, X-701E, and X-720 areas have the potential to have TCE present at levels above the PHC threshold value of 282 mg/kg. There is the potential that additional elevated levels of TCE may be found in soils associated with landfills being considered as potential sources of fill.

Sampling results at PORTS indicates levels of TCE in some of the soils near buildings X-700, X-701E, and X-720 in the range of 290 to 15,000 mg/kg above the PHC threshold value (see Appendix E, Figure E.2). These soils are considered residual soils under DFF&O that would be excavated with the removal of building structures as part of the Process Buildings Project. Unsaturated soils generally would not require any treatment, unless they are directly under historical sources of TCE such as the northeastern corner of Building X-720. Waste or contaminated fill with TCE as a PHC that also contains free liquid would be dewatered prior to use in a potential OSDC to remove the liquids. The water would be collected and treated. In some soil types, the dewatering process is likely to effectively reduce TCE concentrations significantly. However, there are certain soil types (high in clay and/or silt) at PORTS that would not have much reduction in TCE concentrations through dewatering, thereby needing additional treatment to meet a 90 percent reduction standard. Based on the evaluation of the Minford clay soils in the vadose zone (Appendix E) the effectiveness of dewatering the soils is limited due to the high clay content. High levels of up to 15,000 mg/kg under Building X-720 remain in vadose zone residual soils after at least decades of gravity draining and percolation of surface water (rain, run-on/run-off) through those soils. Thus, dewatering of these soils would not reduce the TCE concentration below an average of over 5,000 mg/kg (see TCE concentration in vadose zone soil under the northeastern corner of X-720, Figure E.4, Appendix E of this supplement) in any rational time frame, which is far above the LDR treatment standards for TCE (60 mg/kg) or a unit-specific 90 percent reduction target of up to 700 mg/kg. This condition is also expected in saturated Minford clay after gravity draining is complete.

Site-specific Adjusted Treatment Standard Evaluation

Because additional treatment may not be considered cost-effective and may discourage the consolidation of waste and use of contaminated fill, the adjustment factors considered to develop adjusted standards were also evaluated. Four of the five adjustment factors are considered applicable to PORTS. Only the adjustment factor to have treatment standards consistent with site cleanup levels is not applicable.

Point 4

It is technically inappropriate to treat TCE waste at PORTS beyond dewatering (Adjustment Factor 4(e)(i)).

Using the technical impracticability adjustment factor, the treatment standard can be adjusted on a site-specific basis when it is not technically practicable to achieve these standards because of factors related to technologies and cost (*OAC* 3745-57-72(E)(4)(e)(i)). EPA intends "*… that the technical impracticability adjustment factor will include the general concepts of "technical infeasible" and "inordinately costly" as those terms are used in the federal CERCLA program. These concepts are also described in the RCRA corrective action [advanced notice of proposed rulemaking] ANPR at 61 FR 19432 (May 1, 1990).*" [67 FR 2962, January 22, 2002]. "*Under the "technically inappropriate" variance, the Regional Administrator may approve a site-specific treatment standard if treatment to the* *otherwise applicable standard is not appropriate, even though such treatment is technically possible.*" In the case of PORTS waste, treatment is feasible and achievable to a TCE level of 250 to 700 mg/kg but it would be costly and inappropriate. Under the technically inappropriate variance for RCRA treatment standards, a site-specific treatment standard may be set if treatment to the otherwise applicable standard is not appropriate, even though such treatment is technically possible. Where, as here, there is an option to leave some contaminated soils in place, as opposed to a more aggressive remediation such as excavation, then it is considered technically inappropriate to require treatment when avoiding such treatment will nevertheless be protective and more cost-effective (62 FR 64504, December 5, 1997).

Appendix E demonstrates that there have been many TCE treatment methods applied at PORTS. A list of technologies that have been demonstrated at PORTS are listed in Table 4. Most of these are in situ technologies but they generally have not met treatment goals. Additional efforts at in situ treatment prior to excavation could not be considered to be effective. Ex situ treatment technologies that are effective, such as low temperature thermal desorption or incineration, are very expensive and time consuming. Although these technologies are effective at reducing TCE concentrations, the additional concentration reduction does not add any protection value prior to disposal for the cost (up to $250/cy, as presented in Appendix E) and or time required to implement (15 to 20 cy/hour production rates, as presented in Appendix E). The waste limits calculated that would protect against unacceptable contamination release through the bottom of the landfill, are orders of magnitude higher than any projected TCE concentration in soil after dewatering. Additionally, the removal of free liquids also results in a waste stream that is protective of the underlying liner system. Treatment of soil that has been dewatered or does not contain PHCs would not result in any additional protection of the underlying groundwater or the underlying liner.

Table 4. Pilot Studies/Technology Demonstrations at PORTS

Quadrant I
X-625 Passive Groundwater Treatment • 1996 – Installation of a horizontal (directionally drilled) well • 1996 – Multiple variations of iron filings to evaluate their relative efficiency for destruction of VOCs • 1996 – Palladium-coated iron filings to evaluate their relative efficiency for destruction of VOCs • 1997 – Slow release potassium permanganate grout for destruction of VOCs
X-749 Plume • 1998 – Vacuum-enhanced recovery for more efficient VOC destruction
X-2230N Clean Test Site • 1994 – Installation of a pair of horizontal (directionally drilled) wells and innovative screen material • 1994 – Multi-point injection system for injection of treatment chemicals in the vadose zone • 1994 – Pneumatic fracturing to enhance the subsurface permeability to aid in contaminant removal efficiency • 1995 – Deployment of the colloidal borescope to evaluate groundwater flow direction and velocity to aid in remediation design and deployment • 1996 – Hydraulic fracturing to enhance the subsurface permeability to aid in contaminant removal efficiency and to more efficiently deliver treatment chemicals to the contaminant zone
X-231B • 1992 – In situ soil mixing using solidification/stabilization for contaminant control • 1992 – In situ soil mixing using ambient air vapor extraction for VOC contaminant removal • 1992 – In situ soil mixing using thermally enhanced vapor extraction for enhanced VOC contaminant removal • 1992 – In situ soil mixing using peroxidation for in situ destruction of the organic contaminants

Table 4. Pilot Studies/Technology Demonstrations at PORTS (Continued)

Quadrant I (continued)
X-231A • 1996 – Installation of hydraulically emplaced stacked horizontal soil fractures to enhance contaminant removal efficiency and delivery of treatment chemicals • 1996 – Thermally enhanced vapor extraction using in situ steam generation and sand propped fractures • 1996 – Thermally enhanced vapor extraction using in situ air heaters • 1996 – Hydraulic fractures using iron filings as the proppant for in situ destruction of organic contaminants • 1996 – Hydraulic fractures using permanganate grout as the proppant for in situ destruction of organic contaminants • 1996 – Oxidant grout emplacement in vertical wells for in situ destruction of organic contaminants
Quadrant II
X-701B • 1990 – Contaminated sludges and soils removed from X-701B Holding Pond and Sludge Containment Ponds (800 B-25 boxes/3 million lb) • 1994 – In situ soil mixing using ambient air vapor extraction for VOC contaminant removal • 1996 – Partitioning inner-well tracer tests to evaluate the mass of separate phase contaminant in the zone of interest • 1996 – Surfactant flood to increase the solubility of contaminants in water for enhanced removal efficiencies • 1996 – Installation of a pair of horizontal (directionally drilled) wells and innovative screen material • 1996 – Recirculation between horizontal wells with VOC treatment using iron filings in canisters designed to be installed in situ • 1996 – Photocatalytic destruction of VOCs in groundwater • 1997 – Ultraviolet light destruction of VOCs in groundwater using porous tubes • 1997 – In situ destruction of VOC contaminants using oxidant recirculation between horizontal wells • 1999 – Enhanced in situ VOC removal using steam injection • 1999 – In situ destruction of VOCs using hydrous pyrolysis oxidation • 1999 – Use of electrical resistivity tomography to monitor treatment effectiveness • 1999 – Installation of wells using rotosonic techniques to minimize waste generation • 2000 – Lance permeation of treatment chemicals (oxidants) to destroy VOC contaminants in situ • 2008 – Hydrogen peroxide injections • 2011 – X-701B Interim Remedial Measure (ex situ oxidant)
Quadrant III
X-740 • Installation of poplar trees at X-740 to in situ phytoremediate VOC contaminants
Quadrant IV
X-734 • Installation of poplar trees at X-734 to in situ phytoremediate VOC contaminants

VOC = volatile organic compound

Point 5

The community has expressed a strong preference for consolidating landfills and contaminated soil associated with plumes into an engineered landfill (Adjustment Factor 4(e)(iii)).

Under the community views adjustment factor, EPA and Ohio EPA have identified that the treatment standards can be adjusted (increased or decreased) based on "*The views of the affected local community on the treatment levels or methods in paragraph (E)(4)(d) of this rule as applied at the site, and, for treatment levels, the treatment methods necessary to achieve these levels.*" (*OAC* 3745-57-72(E)(4)(e)(iii)).

While the PORTS community has not yet formally expressed its opinion of the treatment standards or methods being proposed (a step that will occur during the review of the Proposed Plan, if Alternative 2 is the preferred alternative), other interactions have revealed that the community has strongly expressed a desire to have landfills inside of Perimeter Road and soil from groundwater contamination plumes excavated and consolidated into the potential OSDC.

Because of the availability of inexpensive clean fill, the use of contaminated soil and associated waste from select landfills as potential OSDC fill must remain cost effective. There are long-term cost benefits to using the contaminated soil as OSDC fill, as the reliance on long-term engineering and institutional controls across PORTS is reduced; however those cost benefits can be overcome by short-term costs if non-cost-effective treatment methods (such as thermal desorption or chemical oxidation technologies previously implemented at PORTS with high cost but very limited success) are required to be used based on preference or desire.

Therefore, adjustment factor *OAC* 3745-57-72(E)(4)(e)(iii) is an important consideration in PORTS' remedial approach. Consolidation of landfills inside Perimeter Road and obtainment of contaminated fill soil from groundwater contamination areas should support the community desire for potential reuse of the DOE property, following DOE cleanup. This is a factor DOE has considered in developing its proposed adjusted TCE treatment level for consideration by the Ohio EPA Director.

Point 6
Treatment beyond dewatering adds short-term risks to implementation with no commensurate or proportional additional protectiveness benefit (Adjustment Factor 4(e)(iv)).

EPA and Ohio EPA have identified an adjustment factor based on "*The short-term risks presented by the on-site treatment method necessary to achieve the levels or treatment methods in paragraph (E)(4)(d) of this rule*." (*OAC* 3745-57-72(E)(4)(e)(iv)).

Treatment technologies that would have to be considered beyond dewatering that would be required to meet the treatment standard calculated under *OAC* 3745-57-72(E)(4)(d) (90 percent reduction standard) to reduce the concentrations of TCE in the Minford clays typically include some form of heating. Low-temperature thermal treatment is one viable option. With appropriate engineering controls and health and safety considerations, this process should be able to be implemented safely. However, when dealing with heat and additional waste handling, there are increased risks and exposure to industrial, chemical, and radiological hazards. Any off-gases must be collected and treated to avoid inadvertent releases through the air. The chance of spills through additional handling exists as waste is transferred from storage areas to the treatment process and then to the disposal location. Also, the additional heavy equipment and machinery can put workers at risk, even under the best of circumstances.

If the additional treatment was providing additional increases in level of protectiveness or performance of the potential OSDC, then assumption of this risk may be considered worthwhile. However, in the case of pursuing additional treatment prior to disposal in a potential OSDC, there is no added benefit to make assumption of this risk acceptable; therefore, the additional short-term risks from the pursuit of treatment steps beyond dewatering, if they have no commensurate improvement in OSDC protectiveness or performance, are considered unacceptable.

Point 7
Less treatment is appropriate because of the additional protection offered by the engineering design of a potential OSDC (Adjustment Factor 4(e)(v)).

EPA and Ohio EPA provide the opportunity to adjust the treatment standard on a site-specific basis to require less treatment than would otherwise be required because of the protection offered by the engineering design of a CAMU. Five sets of circumstances were identified to use this adjustment factor. The second set of circumstances are most applicable for the potential OSDC, when cost-effective treatment has been used and the CAMU meets the liner and leachate collection requirements for new hazardous waste land disposal units under RCRA.

Under the adjustment factor provided in *OAC* 3745-57-72(E)(4)(e)(v)(b), the Director may adjust the treatment standards based on the long-term protection offered by the engineering design of a CAMU and related engineering controls. As discussed in the EPA CAMU regulation preamble, this adjustment factor reflects the concerns about the uncertainties of long-term containment; thus, when the treatment standards from 3745-57-72(E)(4)(d) have not been substantially met, this adjustment factor would require more robust engineering controls to reduce the potential for and consequences of unit failure. It would also require cost-effective treatment.

As discussed in the preamble to EPA's proposed amendments to the CAMU rule, "*… the concept of "cost-effective" treatment for the purpose of this adjustment factor E [v for OAC 3745-57-72(E)(4)(e)] means that the additional cost associated with increased treatment is proportionate to the increase in protection that the treatment would provide. EPA expects that assessments of cost-effectiveness will be made based on a reasonable review of the costs and the increased protection provided by treatment and on the best professional judgment of the decision maker.*" (65 FR 51106, August 22, 2000).

This adjustment factor requires a more rigorous approach to engineering design and related controls than the minimum State of Ohio and national design standards for CAMUs in that it requires compliance with the liner and leachate collection requirements for new hazardous waste land disposal units at 40 *CFR* 264.301(c) and (d). As discussed in the national regulation, the liner and leachate collection requirements for new hazardous waste landfills are well established and understood, and units constructed to meet the liner and leachate collection requirements for new hazardous waste landfills generally offer a high degree of protection over time (65 FR 51107, August 22, 2000). Because the engineering design and related engineering controls required by this provision are very robust, EPA did not limit this adjustment factor to just PHCs of very low mobility.

Because TCE at PORTS has a cost-effective treatment option of dewatering of free liquids for free-product removal, and because the potential OSDC has engineering design and related controls that exceed the minimum design standards for CAMUs (including liner and leachate collection requirements for new hazardous waste land disposal units under 40 *CFR* 264.301(c) and (d) [see Table 2]), the adjustment factor under 3745-57-72(E)(4)(e)(v)(b) is the most appropriate. Waste Disposition RI/FS Appendix J and the OSDC Intermediate Design Package provide more information about the design of the potential OSDC.

Dewatering of waste to remove free liquids, including pure organic solvents, would be the treatment method of choice at PORTS. Dewatering of waste to remove free liquids is required to meet other elements of the draft WAC of a potential OSDC and to remove free product that may impact liner performance. This process primarily removes free liquids that could compromise the structural stability or liner effectiveness of a potential OSDC. It also lessens any burden on a leachate collection and treatment system. Dewatering is therefore considered cost-effective. Any additional treatment does not provide any additional environmental protection because the engineering elements and siting geology (competent bedrock) are robust, protecting against contaminant migration. Through the final cap and institutional controls, protection of public health and the environment would continue to occur after closure of the potential OSDC. And once free product is removed from a waste stream, additional treatment will not provide more protection of the underlying liner.

DOE's Proposed Adjusted Standard for TCE

On the basis of the four adjustment factors described above, DOE has identified an adjusted standard for TCE. This standard only applies to waste streams where TCE is identified as a PHC. It is proposed as an adjusted standard for application to representative soil and waste material conditions after the initial treatment process (dewatering) is completed, as necessary. Demonstration of achievement of the standard during field implementation can be shown either through pre-excavation or post-excavation and/or treatment characterization.

Point 8
The proposed site-specific adjusted TCE treatment standard will be applied to unsaturated soil (or saturated soil after dewatering) and is protective of human health and the environment.

DOE is requesting, as a conservative measure, an adjusted treatment standard under *OAC* 3745-57-72(E)(4)(e) for TCE of 5,000 mg/kg for contaminated soils to be used as fill. As demonstrated in the Waste Disposition RI/FS, Alternative 2 will require substantial amounts of soil that will be used as fill. Fill is critical to the management of wastes in the OSDC/CAMU because it is used to structurally support D&D wastes and provide a buffer to protect the liner that contains leachate that will be generated. The use of PORTS borrow soil consisting of contaminated residual soils and aquifer materials has an added benefit of removing contaminated soils that would serve as source for continued groundwater contamination and impact future use of the site. Other future groundwater remediation alternatives would still offer containment of contaminated groundwater, but source areas containing TCE dense non-aqueous phase liquid (DNAPL) do not have to be removed to accomplish these goals. Therefore, use of residual soil as fill and, potentially, highly contaminated aquifer material, offers an opportunity to significantly enhance the scope of remediation and benefit the site for future use. If soils must be treated to a treatment standard of 500 mg/kg as demonstrated in Appendix E, significant constraints on the operation and management of the remedy may result. This appendix lists specific potential problems that can impact the ability to treat heavily contaminated soils in a timely manner. The concept of an adjusted treatment standard posed by EPA was designed just for cases such as PORTS where the extra cost and time for alternative treatments is also not justified, based on the capabilities of the engineering design. One aspect of the design is that the proposed adjusted treatment standard is still within a concentration range that has been found to have little degradation effect on the initial liner or the liner system. DOE is proposing an adjusted treatment standard on a site-wide basis because it has determined that PORTS sources of clay-rich soils are beneficial for Alternative 2. If a PORTS fill source of contaminated soils is not used, then an adjusted treatment standard will have no basis and the treatment standard will revert to the accepted treatment standard of 500 mg/kg.

During excavation, both saturated and unsaturated contaminated soils would be broken up by heavy excavation equipment to facilitate draining of liquid and removal of potential TCE free product. This process would prepare the contaminated soils for subsequent WAC characterization, transportation to, and placement in the OSDC. The adjusted treatment standard will serve as a "ceiling" limit whereby the representative TCE soil or waste concentrations cannot exceed the adjusted standard after cost-effective treatment, if needed, has occurred. This standard is one-third to one-half the EPA guidance level of 10,000 to 15,000 mg/kg in clay soil indicative of free product. It is mainly proposed out of excess caution to safeguard the OSDC liner materials from exposure to excessive remaining TCE free product potentially still trapped in certain soil types even through the initial excavation process and after field dewatering. If the representative concentrations exceed the ceiling limit, additional steps will be necessary prior to acceptance for disposal at the potential OSDC to meet the free liquid prohibition in the WAC.

Therefore, an adjusted standard of 5,000 mg/kg will also significantly benefit the environment by allowing for an increase of the amount of remediation that will occur at PORTS. Without an adjusted treatment standard, the movement of contaminated residual soil, and other contaminated fill to the CAMU would be more costly in terms of time and management costs and offer less improvement to the site because large areas of contamination may remain in place instead of being placed into a protective engineered landfill. The increased costs and time management concerns to treat volumes of highly contaminated soil is not justified because the adjusted standard is also based on protectiveness of the engineered liner system.

Appendix E also illustrates the potential impact dewatering may have on TCE-contaminated soil at PORTS. Dewatering to other ARAR-based restrictions will be required prior to any waste disposal to assure no free liquids are disposed in the OSDC and Ohio EPA has considered dewatering and DNAPL removal to be a cost-effective treatment for TCE removal in water saturated soils. Appendix E illustrates that some soil matrices (e.g., Gallia Formation sand and gravel) would dewater relatively easy, resulting in fairly low concentrations of TCE. However, those soil matrices (e.g., Minford Formation clay and silt) with high clay content are unlikely to have significant reduction in levels of TCE through dewatering. Contaminated Minford soils are desirable as fill material, but using it is also weighing heavily in the request for an adjusted treatment standard. The characteristics of clay-rich soils like those of the Minford Formation indicate that drainage of these soils to meet geotechnical and geochemical standards may require a significant time period or extensive post-generation processing. Because the logic of operations required to place building materials in the OSDC requires adequate volumes of fill to pack around building wastes, delays in disposal can result if fill is not available and impact the scope of remedial operations. In addition, after dewatering, the residual levels of TCE in soil are estimated to be, on the average, over 5,000 mg/kg, but could be as high as 15,000 mg/kg (see Figure E.4, Appendix E) in some of the most significant TCE source areas at PORTS with facilities that stored and/or used large quantity of TCE for many decades, such as Building X-720. Therefore, additional steps may be required in this area to achieve the proposed adjusted standard of 5,000 mg/kg following any required dewatering and processing for disposal.

If soil or waste exceeds the proposed adjusted standard (measured after soil has been prepared/blended with other material from the AOC to meet all other operational requirements of the potential OSDC), the contaminated soil or wastes would be segregated and further treated to reduce TCE concentrations to below 5,000 mg/kg or be shipped off Site for treatment and disposal. As an example, it is noted in Appendix E that residual soil data from underneath Building X-720 suggests that dewatered soils from this area of PORTS may still have TCE concentrations over 5,000 mg/kg. In this example case, if these soils have TCE concentrations over 5,000 mg/kg after necessary preparation or blending to meet other OSDC operational requirements, these contaminated soils would be segregated and further treated to meet the 5,000 mg/kg ceiling limit, or otherwise shipped off Site for treatment and disposal.

Under *OAC* 3745-57-72(E)(4)(e)(v)(*b*), the Director of Ohio EPA has the basis to approve this adjusted standard of dewatering and a ceiling limit of 5,000 mg/kg because cost-effective treatment has been used and the resulting condition is protective of the potential OSDC liner. As also required under *OAC* 3745-57-72(E)(4)(e)(v)(*b*), the potential OSDC liner system design exceeds the liner and leachate collection requirements for new land disposal units as required by paragraphs C and D of *OAC* 3745-57-03, which has been adopted as an ARAR for the potential OSDC under Alternative 2. The other adjustment factors discussed under Points 4, 5, and 6 provide further supporting bases for the Director of Ohio EPA to approve the proposed adjusted standard. The adjusted standard will allow implementation of the remedy in a timely and cost effective manner that is in keeping with scope of the remedial actions for a mega-site like PORTS. As discussed in Alternative 2 of the Waste Disposition RI/FS, more contamination will be removed if residual soils, along with other contaminated soils, are used as fill, which has a benefit of revitalizing larger areas of the site. By providing justification for the adjusted standard under several adjustment factors (Points 4, 5, 6, and 8), the proposed designation of the CAMU and the adoption of an adjusted standard meets the requirements of *OAC* 3745-57-72(E)(4).

The director may adjust the treatment level based on the long-term protection offered by the engineering design of the CAMU and related engineering controls where, after review of appropriate treatment technologies, the director determines that cost-effective treatment has been used, and the CAMU meets the liner and leachate collection requirements for new land disposal units at paragraphs (C) and (D) of rule 3745-57-03 of the Administrative Code, as appropriate. The adjusted level or method must be protective of human health and the environment.

FUTURE STORAGE AND/OR TREATMENT CAMU(S)

Storage and/or treatment CAMU(s) can also be used for temporary storage and/or treatment of wastes which would not remain after closure of the treatment, storage and disposal CAMU (the potential OSDC). It is likely that one or more temporary storage and/or treatment CAMU(s) may be established within the AOC during implementation of Alternative 2. The identification of such CAMU(s) would be presented in future regulatory design documents or remedial design submittals subject to approval/concurrence by Ohio EPA under the DFF&O, Consent Decree, or other applicable regulatory agreements with Ohio EPA.

RELATIONSHIP TO OTHER CLEANUP DECISIONS

Consistent with the DFF&O RI/FS statement of work (Attachment A of the DFF&O, Section 3.5.1), DOE has considered all anticipated waste streams to be generated under the DFF&O work activities and the potential waste streams outside of the DFF&O in the technical evaluation of the CAMU designations and the associated identification of PHCs and setting of treatment standards presented in this supplement to the Waste Disposition RI/FS. Although all anticipated waste streams have been considered in the technical CAMU evaluations, additional regulatory authorizations/approvals would be necessary to place those waste streams that originate outside of the DFF&O work activities into the CAMU.

If the future authorizations/approvals for the excavation and placement of waste streams that originate outside the DFF&O work activities in a potential OSDC occur, the identified PHC and adjusted standard presented in this supplement to the Waste Disposition RI/FS would serve as overarching WAC limits for all CAMU-eligible waste streams authorized for disposal in a potential OSDC, irrespective of their regulatory origin.

PUBLIC NOTICE OF CAMU DESIGNATION

Under *OAC* 3745-57-72(H), the Ohio EPA Director is required to provide public notice and a reasonable opportunity for public comment before final designation of the CAMU. If Alternative 2 is identified as the preferred alternative, Ohio EPA could use the Waste Disposition Proposed Plan as the means to provide public notice and seek public comments on the proposed CAMU designation. Following the receipt and review of public comments on the Proposed Plan, the Ohio EPA Director could provide his final designation of the CAMU, and any revisions necessary as a result of public comment, in the Waste Disposition ROD.

APPENDIX A: AREA OF CONTAMINATION IDENTIFICATION

FIGURES

ACRONYMS

AOC	area of contamination
CAMU	Corrective Action Management Unit
DOE	U.S. Department of Energy
PORTS	Portsmouth Gaseous Diffusion Plant
RCRA	Resource Conservation and Recovery Act of 1976, as amended

Appendix A presents the known information about the widespread indicators of contamination (i.e., locations on Portsmouth Gaseous Diffusion Plant [PORTS] with constituent concentrations above background) and provides the rationale for identifying a formal Area of Contamination (AOC). This AOC is a fundamental component for the overall efficient cleanup of PORTS.

The AOC concept was discussed in detail in the preamble to the National Contingency Plan (55 Federal Register 8758-8760; March 8, 1990). In this discussion, the U.S. Environmental Protection Agency clarified that certain areas of generally-dispersed contamination can be called “areas of contamination” or “AOCs” and that movement of hazardous wastes within those areas would not be considered land disposal and would not trigger the Resource Conservation and Recovery Act of 1976, as amended (RCRA), land disposal restrictions.

PORTS has been extensively investigated over that past 25 years to characterize the soil (surface and subsurface, Figure A.1) and groundwater through invasive sampling and analysis. The results of this characterization have identified generally dispersed soil contamination across PORTS.

In light of the generally-dispersed contamination as depicted in Figure A.1 and in conjunction with the Corrective Action Management Unit (CAMU) designation, an AOC has been identified to facilitate the efficient removal and remedial activities discussed in the Site-wide Waste Disposition Evaluation Project Remedial Investigation/Feasibility Study report, should Alternative 2 be selected. The AOC has been limited to depict only the necessary footprint to allow the unencumbered movement of waste within the confines of the AOC during planned remedial activities and to ensure that the overall cleanup can be done in an efficient and cost effective manner.

Figure A.2 shows the AOC boundary and the locations where contamination has been identified.

In compliance with applicable or relevant and appropriate requirements, and as described in future design plans, the AOC will be utilized to: (1) remove free liquids in situ from CAMU-eligible waste, which is the first step in treatment to meet principal hazardous constituent treatment standards; (2) collect free liquids removed from CAMU-eligible and -ineligible wastes for treatment and disposal; (3) collect trichloroethene dense non-aqueous phase liquids for off-Site disposal; and (4) transport of wastes to treatment CAMU(s) and the disposal CAMU. Through extensive sampling, the U.S. Department of Energy (DOE) has defined the horizontal boundaries of the AOC at DOE’s Portsmouth reservation as depicted in Figure A.2. While the contiguous vertical depth of contamination within this area varies, by using this extensive sampling data, DOE will be able to navigate during the remediation to either ensure remedial activities comport with the AOC policy when working in contaminated media for purposes of RCRA compliance, or use other appropriate remedial regulatory tools, such as storage/treatment CAMUs as discussed in the document, when remedial activities are outside the scope of the AOC policy. Furthermore, while extensive sample data results have not been gathered from underneath buildings within the potential AOC, DOE believes that, at a minimum the Director should concur that these areas under the buildings would be within the general horizontal AOC presented. These buildings as they exist currently are encompassed by other areas of generally dispersed contamination and therefore fall within the scope of an AOC.

APPENDIX B: COMPARISON CROSSWALK OF *OAC* 3745-57-72 REQUIREMENTS TO DOE’S PROPOSED APPROACH FOR CAMU DESIGNATIONS

Appendix B is a crosswalk matrix of the *Ohio Administrative Code* 3745-57-72 Corrective Action Management Unit rule requirements alongside text that describes the U.S. Department of Energy's (DOE's) approach to complying with this rule. The crosswalk matrix is a line-by-line presentation of the rule with the corresponding proposed action that demonstrates DOE's approach addresses each and every aspect of the rule.

3745-57-72 Corrective Action Management Units (CAMUs)

RULE	DOE Approach
(A) To implement remedies under rule 3745-54-101 of the Administrative Code or Section 3008(h) of RCRA, or to implement remedies at a permitted facility that is not subject to rule 3745-54-101 of the Administrative Code, the director may designate an area at the facility as a corrective action management unit under the requirements in this rule. Corrective action management unit (CAMU) means an area within a facility that is used only for managing CAMU-eligible wastes for implementing corrective action or cleanup at the facility. A CAMU must be located within the contiguous property under the control of the owner or operator where the wastes to be managed in the CAMU originated. One or more CAMUs may be designated at a facility.	CAMUs designated at PORTS will be located within the contiguous property under the control of DOE. One disposal CAMU and one or more T/S CAMUs are requested for designation. The T/S/D CAMU will be adjacent to the AOC at PORTS. The T/S CAMU(s), as needed, will be located within the AOC, represented in Appendix A. The AOC will be utilized to: (1) remove free liquids from CAMU-eligible waste, which is the first step in treatment to meet PHC treatment standards; (2) remove free liquids from CAMU-ineligible wastes; (3) collect free liquids removed from CAMU-eligible and -ineligible wastes for treatment and disposal; (4) collection of TCE DNAPL for off-Site disposal; and (5) transport of wastes to treatment CAMU(s) and the disposal CAMU. The AOC will extend areally as depicted in Appendix A and within the area will extend from the surface of the contamination in the AOC to the full depth of contamination below the ground surface in the AOC.
(1) CAMU-eligible waste means:	--
(a) All non-hazardous and hazardous wastes, and all media (including ground water, surface water, soils, and sediments) and debris, that are managed for implementing cleanup. As-generated wastes (either hazardous or non-hazardous) from ongoing industrial operations at a site are not CAMU-eligible wastes.	Appendix C identifies the projected types and quantities of CAMU-eligible and -ineligible hazardous and non-hazardous wastes slated for on-Site disposal at PORTS, based on Waste Disposition and Process Buildings RI/FS information. All wastes are managed for implementing cleanup, and no as-generated wastes from ongoing industrial operations are envisioned.
(b) Wastes that would otherwise meet the description in paragraph (A)(1)(a) of this rule are not "CAMU-Eligible Wastes" where:	--
(i) The wastes are hazardous wastes found during cleanup in intact or substantially intact containers, tanks, or other non-land-based units found above ground, unless the wastes are first placed in the tanks, containers or non-land-based units as part of cleanup, or the containers or tanks are excavated during the course of cleanup; or	See Appendix C. Non-CAMU-eligible wastes have been identified In Appendix C, based on RI/FS information.
(ii) The director exercises the discretion in paragraph (A)(2) of this rule to prohibit the wastes from management in a CAMU.	Acknowledged. However, it is not expected that this discretion is necessary.
(c) Notwithstanding paragraph (A)(1)(a) of this rule, where appropriate, as-generated non-hazardous waste may be placed in a CAMU where such waste is being used to facilitate treatment or the performance of the CAMU.	Acknowledged. However, this type of waste is not expected -- Appendix C identifies the non-hazardous wastes that will be disposed in the potential OSDC (future references to the OSDC within this crosswalk without the preface of 'potential' recognize that until Alternative 2 is selected as the remedy, the OSDC is still a potential part of that remedy). All wastes are managed for implementing cleanup.
(2) The director may prohibit, where appropriate, the placement of waste in a CAMU where the director has or receives information that such wastes have not been managed in compliance with applicable land disposal treatment standards of Chapter 3745-270 of the Administrative Code, or applicable unit design requirements of Chapters 3745-54 to 3745-57 and 3745-205 of the Administrative Code, or applicable unit design requirements of Chapters 3745-65 to 3745-69 and 3745-256 of the Administrative Code, or that non-compliance with other applicable requirements of the hazardous waste rules likely contributed to the release of the waste.	Acknowledged. However, it is not expected that this prohibition will be necessary.
(3) Prohibition against placing liquids in CAMUs.	See (3)(a),(b),(c), and (d) below.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(a) The placement of bulk or noncontainerized liquid hazardous waste or free liquids contained in hazardous waste (whether or not sorbents have been added) in any CAMU is prohibited except where placement of such wastes facilitates the remedy selected for the waste.	There will be free liquids associated with remediation of soil, including saturated soil. In addition, there will be rainwater and infiltration water in the remediation area which must be managed. The water (rainwater/infiltration water) from an open remediation/excavation is indistinguishable from the rainwater that will enter the OSDC. The remediation plan will require draining of these free liquids within the AOC at the active remediation area, so the contaminated water can be collected and treated in a wastewater treatment system. Encountered DNAPLs will be collected from the remediation/excavation and segregated from the waste stream being sent to the OSDC. If required, the excavated soil will then be transported to a T/S CAMU for treatment to meet PHC treatment requirements, or the soil will be transported to the disposal CAMU for disposal. It is possible that during transport of the excavated soil, some additional liquids may be freed from the soil matrix. Excavated/remediated soil may require blending to support operational requirements and will be placed in the disposal CAMU so long as the material can pass the Proctor test after compaction.
(b) The requirements in paragraph (C) of rule 3745-57-14 of the Administrative Code for placement of containers holding free liquids in landfills apply to placement in a CAMU except where placement facilitates the remedy selected for the waste.	The disposition (placement) of containers holding free liquids into the OSDC will not occur. The requirements in paragraph (C) of rule 3745-57-14 of the Administrative Code are listed as an ARAR and will be complied with.
(c) The placement of any liquid which is not a hazardous waste in a CAMU is prohibited unless such placement facilitates the remedy selected for the waste or a demonstration is made pursuant to paragraph (E) of rule 3745-57-14 of the Administrative Code.	The placement of liquids that are not hazardous wastes into a T/S or disposal CAMU will not occur. The requirements in paragraph (E) of rule 3745-57-14 of the Administrative Code are listed as an ARAR and will be complied with.
(d) The absence or presence of free liquids in either a containerized or a bulk waste must be determined in accordance with paragraph (B) of rule 3745-57-14 of the Administrative Code. Sorbents used to treat free liquids in CAMUs must meet the requirements of paragraph (D) of rule 3745-57-14 of the Administrative Code.	The presence of free liquids will be demonstrated through the “Paint Filters Liquids Test” (Method 9095B), and DOE will define the use of treatment including free-draining liquids/water and the use of absorbents, if appropriate, during remedial design. The DFF&O-required WAC Implementation Plan and OSDC Operations Plan will be the design documents utilized to present a compliant design plan meeting this requirement, for Ohio EPA review and approval/concurrence.
(4) Placement of CAMU-eligible wastes into or within a CAMU does not constitute land disposal of hazardous wastes.	Agreed.
(5) Consolidation or placement of CAMU-eligible wastes into or within a CAMU does not constitute creation of a unit subject to minimum technology requirements.	Agreed.
(B)	
(1) The director may designate a regulated unit [as described in paragraph (A)(2) of rule 3745-54-90 of the Administrative Code] as a CAMU, or may incorporate a regulated unit into a CAMU, if:	This provision is not applicable. The proposed disposal location will be in a clean, uncontaminated area and, not locating it at the site of or extending the boundaries of an existing regulated unit and treatment/storage CAMUs as needed, will not incorporate regulated units.
(a) The regulated unit is closed or closing, meaning it has begun the closure process under rule 3745-55-13 or 3745-66-13 of the Administrative Code; and	As above.
(b) Inclusion of the regulated unit will enhance implementation of effective, protective, and reliable remedial actions for the facility.	As above.
(2) The requirements of rules 3745-54-90 to 3745-54-101, 3745-55-10 to 3745-55-20, and 3745-55-40 to 3745-55-51 of the Administrative Code and the unit-specific requirements of Chapters 3745-54 to 3745-57, 3745-65 to 3745-69, 3745-205, and 3745-256 of the Administrative Code that applied to the regulated unit will continue to apply to that portion of the CAMU after incorporation into the CAMU.	As above.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(C) The director will designate a CAMU that will be used for storage and/or treatment only in accordance with paragraph (F) of this rule. The director will designate all other CAMUs in accordance with the following:	
(1) The CAMU must facilitate the implementation of reliable, effective, protective, and cost-effective remedies;	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(2) Waste management activities associated with the CAMU must not create unacceptable risks to humans or to the environment resulting from exposure to hazardous wastes or hazardous constituents;	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(3) The CAMU must include uncontaminated areas of the facility, only if including such areas for the purpose of managing CAMU-eligible waste is more protective than management of such wastes at contaminated areas of the facility;	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(4) Areas within the CAMU, where wastes remain in place after closure of the CAMU, must be managed and contained so as to minimize future releases, to the extent practicable;	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(5) The CAMU must expedite the timing of remedial activity implementation, when appropriate and practicable;	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(6) The CAMU must enable the use, when appropriate, of treatment technologies (including innovative technologies) to enhance the long-term effectiveness of remedial actions by reducing the toxicity, mobility, or volume of wastes that will remain in place after closure of the CAMU; and	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(7) The CAMU must, to the extent practicable, minimize the land area of the facility upon which wastes will remain in place after closure of the CAMU.	See text in CAMU Designation section contained within the "SUPPLEMENT NO. 1 TO THE REMEDIAL INVESTIGATION AND FEASIBILITY STUDY REPORT FOR THE SITE-WIDE WASTE DISPOSITION EVALUATION PROJECT PROPOSED CORRECTIVE ACTION MANAGEMENT UNIT AND AREA OF CONTAMINATION DESIGNATIONS FOR ALTERNATIVE 2 AT THE PORTSMOUTH GASEOUS DIFFUSION PLANT, PIKETON, OHIO"
(D) The owner/operator must provide sufficient information to enable the director to designate a CAMU in accordance with the criteria in this rule. This must include, unless not reasonably available, information on:	
(1) The origin of the waste and how it was subsequently managed (including a description of the timing and circumstances surrounding the disposal and/or release);	Based on the RFIs under the Consent Decree conducted under Ohio EPA oversight, the CAMU-eligible waste (which is the source of the PHC in soil and groundwater) was generated during GDP operations during the 1950s, '60s, '70s, and early '80s when wastes were managed in unlined wastewater treatment ponds, were disposed in landfills with no engineered liners, and were not managed per current standards. The Consent Decree required multiple RCRA unit closures which were implemented pursuant to Ohio EPA-approved closure plans and closures under solid waste regulations, as well as implementation of corrective measures for other waste units.
(2) Whether the waste was listed or identified as hazardous at the time of disposal and/or release; and	Initial releases and disposal of CAMU-eligible wastes occurred prior to and after the effective date of RCRA rules; management of F-listed wastes did occur post-RCRA until implementation of RCRA closures approved by Ohio EPA pursuant to the Consent

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
	Decree. Based on the RFIs under the Consent Decree conducted under Ohio EPA oversight, the CAMU-eligible waste (which is the source of the PHC in soil and groundwater) was generated during GDP operations during the 1950s, '60s, '70s, and early '80s when wastes were managed in unlined wastewater treatment ponds, were disposed in landfills with no engineered liners, and were not managed per current standards.
(3) Whether the disposal and/or release of the waste occurred before or after the land disposal requirements of Chapter 3745-270 of the Administrative Code were in effect for the waste listing or characteristic.	Initial releases & disposal occurred prior to and after the effective date of RCRA rules and before the LDRs of Chapter 3745-270 were in effect. Based on the RFIs under the Consent Decree conducted under Ohio EPA oversight, the CAMU-eligible waste (which is the source of the PHC in soil and groundwater) was generated during GDP operations during the 1950s, '60s, '70s, and early '80s when wastes were managed in unlined wastewater treatment ponds, were disposed in landfills with no engineered liners, and were not managed per current standards.
(E) The director will specify, in the permit or order, requirements for CAMUs to include the following:	
(1) The areal configuration of the CAMU.	The disposal CAMU (OSDC) will have an areal configuration that accommodates 12 potential cells to contain approximately 5 million cubic yards of waste (solid waste, construction/demolition debris, treated waste, soil, etc.). The design plans will be consistent with the Waste Disposition ROD and the specific design will be submitted in design plans for Ohio EPA concurrence. T/S CAMU configurations will be presented in the Integrated Remedial Design Plans (or the like) for remediation areas that are subject to approval/concurrence by Ohio EPA. These will comply with Section (F) below.
(2) Except as provided in paragraph (G) of this rule, requirements for CAMU-eligible waste management to include the specification of applicable design, operation, treatment and closure requirements in the hazardous waste rules.	The disposal CAMU (OSDC) will have an areal configuration that accommodates 12 potential cells to contain approximately 5 million cubic yards of waste (solid waste, construction/demolition debris, treated waste, soil, etc.). The design plans will be consistent with the Waste Disposition ROD and the specific design will be submitted in design plans for Ohio EPA concurrence. T/S CAMU configurations will be presented in the Integrated Remedial Design Plans (or the like) for remediation areas that are subject to approval/concurrence by Ohio EPA. These will comply with Section (F) below.
(3) Minimum design requirements. CAMUs, except as provided in paragraph (F) of this rule, into which wastes are placed must be designed in accordance with the following:	The disposal CAMU (OSDC) will have an areal configuration that accommodates 12 potential cells to contain approximately 5 million cubic yards of waste (solid waste, construction/demolition debris, treated waste, soil, etc.). The design plans will be consistent with the Waste Disposition ROD and the specific design will be submitted in design plans for Ohio EPA concurrence. T/S CAMU configurations will be presented in the Integrated Remedial Design Plans (or the like) for remediation areas that are subject to approval/concurrence by Ohio EPA. These will comply with Section (F) below.
(a) Unless the director approves alternate requirements under paragraph (E)(3)(b) of this rule, CAMUs that consist of new, replacement, or laterally expanded units must include a [1]composite liner and a leachate collection system that is designed and constructed to maintain [2]less than a thirty centimeter depth of leachate over the liner. For purposes of this rule, composite liner means a system [3]consisting of two components; the upper component must consist of a [4]minimum thirty mil flexible membrane liner, and the lower component must consist of [5]at least a two-foot layer of compacted soil with a [6]hydraulic conductivity of no more than 1×10^{-7} cm/sec. Flexible membrane liner components consisting of high density polyethylene must be [7]at least sixty mil thick. The flexible membrane liner component must be installed in [8]direct and uniform contact with the compacted soil component; *NOTE: the superscript brackets [ ] have been added for ease of comparison to the proposed design.*	The OSDC Liner system is a composite liner system[1] consisting of 5 components[3]. The components of the liner system consist of the following from bottom to top: a. **Compacted Clay Liner**: 3 ft of compacted clay[5] (hydraulic conductivity less than 1 x 10^{-7} cm/sec)[6], b. **Secondary Barrier Layer**: GCL, 80-mil-thick HDPE flexible membrane liner[8], and cushion geotextile, e. **Leak Detection System Drainage Layer**: 1 ft leak detection gravel, f. **Primary Barrier Layer**: GCL, 80-mil-thick flexible membrane liner, and cushion geotextile,[4,7] i. **Leachate Collection System Drainage Layer**: 1 ft of drainage gravel. Drainage and leak detection layers have a minimum permeability of 1 x 10^{-2} cm/sec and are designed to allow no more than 1 ft (30 cm) of head on the liner[2]. The liner surface has a minimum slope of 2% toward the leachate collection corridor and 1% within the leachate collection corridor which allows the leachate to exit the OSDC via gravity.
(b) Alternate requirements. The director may approve alternate requirements if:	See (E)(3)(a) above.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(i) The director finds that alternate design and operating practices, together with location characteristics, will prevent the migration of any hazardous constituents into the ground water or surface water at least as effectively as the liner and leachate collection systems in paragraph (E)(3)(a) of this rule; or	See (E)(3)(a) above.
(ii) The CAMU is to be established in an area with existing significant levels of contamination, and the director finds that an alternative design, including a design that does not include a liner, would prevent migration from the unit that would exceed long-term remedial goals.	See (E)(3)(a) above.
(4) Minimum treatment requirements: Unless the wastes will be placed in a CAMU for storage and/or treatment only in accordance with paragraph (F) of this rule, CAMU-eligible wastes that, absent this rule, would be subject to the treatment requirements of Chapter 3745-270 of the Administrative Code, and that the director determines contain principal hazardous constituents must be treated to the standards specified in paragraph (E)(4)(c) of this rule.	See (E)(4)(d)(iii).
(a) Principal hazardous constituents are those constituents that the director determines pose a risk to human health and the environment substantially higher than the cleanup levels or goals at the site.	Acknowledged.
(i) In general, the director will designate as principal hazardous constituents:	Acknowledged; see below.
(a) Carcinogens that pose a potential direct risk from ingestion or inhalation at the site at or above 10^{-3}; and	The analysis indicates that TCE has met this criterion for designation as a PHC (see Appendix D). The existing data, all of which is part of the Administrative Record as data collected pursuant to Ohio EPA Consent Decree requirements and as data collected pursuant to requirements under the D&D DFF&O, has been evaluated and shows that only TCE is present in CAMU-eligible wastes at concentrations that would pose a $>10^{-3}$ ELCR or HQ of 10. An evaluation of the PORTS databases for other prominent carcinogenic COPCs has been performed against their respective threshold value and no other constituent has been detected above the threshold criteria. Therefore, TCE is recognized as the single PHC for the T/S/D CAMU. However, if during evaluation of data gained by additional routine characterization during the corrective action and remedial design/remedial action processes, a constituent is identified as a potential PHC, Ohio EPA will be notified to determine if conditions warrant the designation of an additional PHC.
(b) Non-carcinogens that pose a potential direct risk from ingestion or inhalation at the site an order of magnitude or greater over their reference dose.	An evaluation of the PORTS databases for non-carcinogenic COPCs has been performed against their respective threshold value and no constituent has been detected above the threshold criteria. However, if during evaluation of data gained by additional routine characterization during the corrective action and remedial design/remedial action processes, a constituent is identified as a potential PHC, Ohio EPA will be notified to determine if conditions warrant the designation of an additional PHC.
(ii) The director will also designate constituents as principal hazardous constituents, where appropriate, when risks to human health and the environment posed by the potential migration of constituents in wastes to ground water are substantially higher than cleanup levels or goals at the site; when making such a designation, the director may consider such factors as constituent concentrations, and fate and transport characteristics under site conditions.	Acknowledged. It is not anticipated that risks to human health and the environment posed by potential migration of constituents in wastes to groundwater will be substantially higher than cleanup levels or goals. TCE is proposed as the single PHC in soil. However, if during evaluation of data gained by additional routine characterization during the corrective action and remedial design/remedial action processes, a constituent is identified as a potential PHC, Ohio EPA will be notified to determine if conditions warrant the designation of an additional PHC.
(iii) The director may also designate other constituents as principal hazardous constituents that the director determines pose a risk to human health and the environment substantially higher than the cleanup levels or goals at the site.	Acknowledged. However, other constituents in soil have not been identified that meet this criterion. If during evaluation of data gained by additional routine characterization during the corrective action and remedial design/remedial action processes, a constituent is identified as a potential PHC, Ohio EPA will be notified to determine if conditions warrant the designation of an additional PHC.
(b) In determining which constituents are "principal hazardous constituents," the director will consider all constituents which, absent this rule, would be subject to the treatment requirements in Chapter 3745-270 of the Administrative Code.	Acknowledged. TCE is proposed to be the single PHC in soil as it is the only constituent that poses $>1E^{-3}$ ELCR or HQ of 10 and is the driver for all groundwater corrective action. If other PHCs are identified in the future, this section will be reevaluated and reviewed with Ohio EPA for applicability.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(c) Waste that the director determines contains principal hazardous constituents must meet treatment standards determined in accordance with paragraph (E)(4)(d) or (E)(4)(e) of this rule.	Acknowledged. TCE is proposed to be the single PHC in soil.
d) Treatment standards for wastes placed in CAMUs.	See below.
(i) For non-metals, treatment must achieve ninety per cent reduction in total principal hazardous constituent concentrations, except as provided by paragraph (E)(4)(d)(iii) of this rule.	Acknowledged. However, due to site-specific circumstances with TCE as the single PHC, Section (E)(4)(e) is more appropriate and applicable. See (E)(4)(e)(iii) and (E)(4)(e)(v)(b). If other PHCs are identified in the future, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(ii) For metals, treatment must achieve ninety per cent reduction in principal hazardous constituent concentrations as measured in leachate from the treated waste or media [tested according to the toxicity characteristic leaching procedure (TCLP)] or ninety per cent reduction in total constituent concentrations (when a metal removal treatment technology is used), except as provided by paragraph (E)(4)(d)(iii) of this rule.	Acknowledged. However, TCE is proposed as the single PHC in soil based on existing data. If other PHCs are identified in the future, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(iii) When treatment of any principal hazardous constituent to a ninety per cent reduction standard would result in a concentration less than ten times the universal treatment standard for that constituent, treatment to achieve constituent concentrations less than ten times the universal treatment standard is not required. Universal treatment standards are identified in the table in rule 3745-270-48 of the Administrative Code.	Acknowledged.
(iv) For waste exhibiting the hazardous characteristic of ignitability, corrosivity or reactivity, the waste must also be treated to eliminate these characteristics.	Not applicable based on existing data. However, if additional data indicates the presence of other PHCs, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(v) For debris, the debris must be treated in accordance with rule 3745-270-45 of the Administrative Code, or by methods or to levels established under paragraphs (E)(4)(d)(i) to (E)(4)(d)(iv) or paragraph (E)(4)(e) of this rule, whichever the director determines is appropriate.	Hazardous Waste and Universal Waste will be removed prior to demolition of facilities that would render the remainder of the facility as Non-Hazardous Solid Waste or Construction and Demolition Debris (as appropriate) for demolition. The subsequent disposal of the accumulated Universal Waste/Hazardous Waste needs to comply with the WAC (LDR) as it relates to the OSDC. Non-Hazardous Solid Waste and Construction and Demolition Debris are not addressed under this rule.
(vi) Alternatives to TCLP. For metal bearing wastes for which metals removal treatment is not used, the director may specify a leaching test other than the TCLP (U.S. EPA publication SW-846 method 1311) to measure treatment effectiveness, provided the director determines that an alternative leach testing protocol is appropriate for use, and that the alternative more accurately reflects conditions at the site that affect leaching.	Acknowledged.
(e) Adjusted standards. The director may adjust the treatment level or method in paragraph (E)(4)(d) of this rule to a higher or lower level, based on one or more of the following factors, as appropriate. The adjusted level or method must be protective of human health and the environment:	The design and construction of a potential OSDC (the requested disposal CAMU) will provide long-term protection to human health and the environment by containing the contamination inside a double-lined, capped, monitored disposal facility with leachate collection and treatment capabilities. The Intermediate Design Package of the OSDC is included in the Waste Disposition RI/FS and has been reviewed by Ohio EPA. Also see (E)(4)(e)(v)(b).
(i) The technical impracticability of treatment to the levels or by the methods in paragraph (E)(4)(d) of this rule;	DOE believes that, based on U.S. EPA guidance, treating contaminated fill further would be considered technically inappropriate under 3745-57-72(E)(4)(e)(i). Where, as here, if there is an option to leave some contaminated soils in place as opposed to a more aggressive remediation such as excavation, then it is considered technically inappropriate to require treatment when avoiding such treatment will nevertheless be protective and more cost-effective." (62 FR 64504, December 5, 1997)
(ii) The levels or methods in paragraph (E)(4)(d) of this rule would result in concentrations of principal hazardous constituents that are significantly above or below cleanup standards applicable to the site;	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(iii) The views of the affected local community on the treatment levels or methods in paragraph (E)(4)(d) of this rule as applied at the site, and, for treatment levels, the treatment methods necessary to achieve these levels;	The local community will have the opportunity to comment on the Waste Disposition Proposed Plan. The expectation of the local community is for DOE to complete D&D and environmental remediation at PORTS safely and expeditiously and return PORTS to potential reindustrialization. Even more importantly, the community is interested in having the landfills and groundwater plume soil excavated and disposed and, therefore, a cost-effective treatment for that waste is needed.
(iv) The short-term risks presented by the on-site treatment method necessary to achieve the levels or treatment methods in paragraph (E)(4)(d) of this rule;	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(v) The long-term protection offered by the engineering design of the CAMU and related engineering controls:	See (E)(4)(e)(v)(*b*).
(a) Where the treatment standards in paragraph (E)(4)(d) of this rule are substantially met and the principal hazardous constituents in the waste or residuals are of very low mobility; or	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(b) Where cost-effective treatment has been used and the CAMU meets the liner and leachate collection requirements for new land disposal units at paragraphs (C) and (D) of rule 3745-57-03 of the Administrative Code; or	See justification under Point 8 in the main text and Appendix E.
(c) Where, after review of appropriate treatment technologies, the director determines that cost-effective treatment is not reasonably available, and the CAMU meets the liner and leachate collection requirements for new land disposal units at paragraphs (C) and (D) of rule 3745-57-03 of the Administrative Code; or	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(d) Where cost-effective treatment has been used and the principal hazardous constituents in the treated wastes are of very low mobility; or	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(e) Where, after review of appropriate treatment technologies, the director determines that cost-effective treatment is not reasonably available, the principal hazardous constituents in the wastes are of very low mobility, and either the CAMU meets or exceeds the liner standards for new, replacement, or laterally expanded CAMUs in paragraphs (E)(3)(a) and (E)(3)(b) of this rule, or the CAMU provides substantially equivalent or greater protection.	Acknowledged. If additional data indicates the presence of PHCs other than TCE, this section will be reevaluated and reviewed with Ohio EPA for applicability.
(f) The treatment required by the treatment standards must be completed prior to, or within a reasonable time after, placement in the CAMU.	Treatment Standards will be met prior to or within a reasonable time after placement and as a requisite for placement/disposal in the OSDC.
(g) For the purpose of determining whether wastes placed in CAMUs have met site-specific treatment standards, the director may, as appropriate, specify a subset of the principal hazardous constituents in the waste as analytical surrogates for determining whether treatment standards have been met for other principal hazardous constituents. This specification will be based on the degree of difficulty of treatment and analysis of constituents with similar treatment properties.	Not needed based on TCE as single PHC. If other PHCs are identified in the future, this section will be re-evaluated.
(5) Except as provided in paragraph (F) of this rule, requirements for ground water monitoring and corrective action that are sufficient to:	The details of groundwater monitoring, which will comply with all ARARs (solid waste rule requirements and hazardous waste rule requirements), will be submitted as part of the OSDC Design Criteria, OSDC Monitoring Plan that will be submitted for approval/concurrence by Ohio EPA. In general, each cell in the OSDC will have monitoring wells that cover the underlying aquifer system formation by formation.
(a) Continue to detect and to characterize the nature, extent, concentration, direction, and movement of existing releases of hazardous constituents in ground water from sources located within the CAMU; and	OSDC Groundwater monitoring for each cell will consist of upgradient and downgradient wells installed in clusters or nested to monitor 3 different elevations: the Berea Formation, the 680 Sandstone layer (in the Cuyahoga Formation), and the 720 Sandstone layer (in the Cuyahoga Formation).

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(b) Detect and subsequently characterize releases of hazardous constituents to ground water that may occur from areas of the CAMU in which wastes will remain in place after closure of the CAMU; and	OSDC Groundwater monitoring will consist of upgradient and downgradient wells installed in clusters or nested to monitor 3 different elevations: the Berea Formation, the 680 Sandstone layer (in the Cuyahoga Formation), and the 720 Sandstone layer (in the Cuyahoga Formation).
(c) Require notification to the director and corrective action as necessary to protect human health and the environment for releases to ground water from the CAMU.	OSDC Groundwater monitoring plan will require Ohio EPA notification of any releases. The groundwater monitoring plan will state that a corrective action plan will be submitted to Ohio EPA for review/concurrence, as necessary, to ensure protection human health and the environment.
(6) Except as provided in paragraph (F) of this rule, closure and post-closure requirements:	The OSDC Closure Plan, which will comply with all ARARs, will be submitted for approval/concurrence by Ohio EPA. This Closure Plan will address these closure requirements for the area of the T/S/D CAMU (OSDC).
(a) Closure of corrective action management units must:	See (E)(6).
(i) Minimize the need for further maintenance; and	See (E)(6).
(ii) Control, minimize, or eliminate, to the extent necessary to protect human health and the environment, for areas where wastes remain in place, post-closure escape of hazardous wastes, hazardous constituents, leachate, contaminated runoff, or hazardous waste decomposition products to the ground, to surface waters, or to the atmosphere.	See (E)(6).
(b) Requirements for closure of CAMUs must include the following, as appropriate and as deemed necessary by the director for a given CAMU:	Acknowledged.
(i) Requirements for excavation, removal, treatment, or containment of wastes; and	Acknowledged. Wastes will be contained within the OSDC. The leachate collection and removal system will allow leachate to drain from the OSDC. This leachate will be conveyed through double-walled pipes to the ILTS during construction and operation and the PLTS after closure.
(ii) Requirements for removal and decontamination of equipment, devices, and structures used in CAMU-eligible waste management activities within the CAMU.	Acknowledged. Equipment used during waste placement will be decontaminated at the end of their use.
(c) In establishing specific closure requirements for CAMUs under paragraph (E) of this rule, the director will consider the following factors:	See (E)(6).
(i) CAMU characteristics;	See (E)(6).
(ii) Volume of wastes which remain in place after closure;	See (E)(6).
(iii) Potential for releases from the CAMU;	See (E)(6).
(iv) Physical and chemical characteristics of the waste;	See (E)(6).
(v) Hydrogeological and other relevant environmental conditions at the facility which may influence the migration of any potential or actual releases; and	See (E)(6).
(vi) Potential for exposure of humans and environmental receptors if releases were to occur from the CAMU.	See (E)(6).

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(d) Cap requirements:	--
(i) At final closure of the CAMU, for areas in which wastes will remain after closure of the CAMU, with constituent concentrations at or above remedial levels or goals applicable to the site, the owner or operator must cover the CAMU with a final cover designed and constructed to meet the following performance criteria, except as provided in paragraph (E)(6)(d)(ii) of this rule:	The Final Cover system will consist of the following layers from bottom to top: a. Contouring layer, 2 ft compacted clay (max hydraulic conductivity less than 1 x 10^{-7} cm/sec), b. GCL, 80-mil-thick HDPE flexible membrane liner, cushion geotextile, c. 1 ft cover drainage layer, d. 3-ft-thick type D dumped rock fill for biointrusion barrier layer, e. 6 in. filter sand layer, f. 21 in. vegetative soil, and g. 6 in. topsoil with vegetation. This final cover system extends beyond the limits of waste to prevent intrusion of surface water and groundwater into the OSDC after closure. Final cover slopes are anticipated to be 20:1, 10:1, and 6:1 for ease of maintenance, and to maintain stability and minimize erosion.
(a) Provide long-term minimization of migration of liquids through the closed unit;	See (E)(6)(d)(i) above.
(b) Function with minimum maintenance;	See (E)(6)(d)(i) above.
(c) Promote drainage and minimize erosion or abrasion of the cover;	See (E)(6)(d)(i) above.
(d) Accommodate settling and subsidence so that the cover's integrity is maintained; and	See (E)(6)(d)(i) above.
(e) Have a permeability less than or equal to the permeability of any bottom liner system or natural subsoils present.	The impermeable GML layer within the OSDC cap will provide equal initial permeability to the bottom liner system. Both systems rely on GML layers to provide practically impermeable barriers. The cap could also be repaired or replaced if necessary in the future, unlike the bottom liner system for which repair or replacement would not be practical or even possible. Therefore, the cap would be able to maintain longer term low permeability beyond the time frame expected for the bottom liner system.
(ii) The director may determine that modifications to paragraph (E)(6)(d)(i) of this rule are needed to facilitate treatment or the performance of the CAMU (e.g., to promote biodegradation).	See (E)(6)(d)(i)(*e*) above.
(e) Post-closure requirements as necessary to protect human health and the environment, to include, for areas where wastes will remain in place, monitoring and maintenance activities, and the frequency with which such activities must be performed to ensure the integrity of any cap, final cover, or other containment system.	See (E)(6)(d)(i) above. The OSDC Post Closure Care Plan will specify the requirements for monitoring and maintenance of the OSDC after closure to ensure the integrity of the final cover system. Monitoring and maintenance activities and their frequencies will be established in this plan.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(F) CAMUs used for storage and/or treatment only are CAMUs in which wastes will not remain after closure. Such CAMUs must be designated in accordance with all of the requirements of this rule, except as follows.	
(1) CAMUs that are used for storage and/or treatment only and that operate in accordance with the time limits established in the staging pile regulations at paragraphs (D)(1)(c), (H), and (I) of rule 3745-57-74 of the Administrative Code are subject to the requirements for staging piles at paragraphs (D)(1)(a), (D)(1)(b), (D)(2), (E), (F), (J), and (K) of rule 3745-57-74 of the Administrative Code in lieu of the performance standards and requirements for CAMUs in paragraphs (C) and (E)(3) to (E)(6) of this rule.	Treatment/Storage CAMUs will be established as needed near remediation sites and use Staging Piles, which will be described in the Integrated Remedial Design Plans for those specific remediations subject to approval/concurrence by Ohio EPA, as appropriate. Those plans will describe the time limits intended for implementation of the remedy (3745-57-74 (D)(1)(c)) and the requirements of: (D)(1)(a) - facilitation of effective remedy ... (D)(1)(b) - design to prevent or minimize releases ... (D)(2) - establishment of design criteria ... (E) - Ignitable/Reactive prohibitions/criteria ... (F) - Incompatibility of wastes within staging piles ... (J) - Closure Requirements in previously contaminated areas ... (K) - Closure Requirements in previously uncontaminated areas ... Additionally, the OSDC design depicts a T/S CAMU, referenced as the IMTA used to stage/transfer impacted material to the OSDC (Disposal CAMU), where the design of the IMTA is included as part of the design packages submitted to Ohio EPA for their review and concurrence/approval, as appropriate. The design of the IMTA will comply with the requirements of paragraphs (D)(1)(a), (D)(1)(b), (D)(2), (E), (F), (J), and (K) of rule 3745-57-74 of the Administrative Code. However, the time limits for the IMTA must be adjusted to coincide with the operation of the T/S/D CAMU (OSDC); see (F)(2)(a) below.
(2) CAMUs that are used for storage and/or treatment only and that do not operate in accordance with the time limits established in the staging pile regulations at paragraphs (D)(1)(c), (H), and (I) of rule 3745-57-74 of the Administrative Code:	Acknowledged. See (a) below.
(a) Must operate in accordance with a time limit, established by the director, that is no longer than necessary to achieve a timely remedy selected for the waste, and	The OSDC design depicts a T/S CAMU used to stage/transfer impacted material to the OSDC (Disposal CAMU) during timeframes of the year when placement of waste within the OSDC is temporarily postponed due to freeze/thaw cycles in southern Ohio at which times OSDC operational requirements cannot be met. This area is the IMTA and will remain in operation for the duration that the OSDC (Disposal CAMU) is in operation, which is necessary to achieve a timely remedy for the waste.
(b) Are subject to the requirements for staging piles at paragraphs (D)(1)(a), (D)(1)(b), (D)(2), (E), (F), (J), and (K) of rule 3745-57-74 of the Administrative Code in lieu of the performance standards and requirements for CAMUs in paragraphs (C), (E)(4), and (E)(6) of this rule.	Acknowledged. See (F)(1) above.
(G) CAMUs into which wastes are placed where all wastes have constituent levels at or below remedial levels or goals applicable to the site do not have to comply with the requirements for liners at paragraph (E)(3)(a) of this rule, caps at paragraph (E)(6)(d) of this rule, ground water monitoring requirements at paragraph (E)(5) of this rule or, for treatment and/or storage-only CAMUs, the design standards at paragraph (F) of this rule.	Acknowledged.
(H) The director will provide public notice and a reasonable opportunity for public comment before designating a CAMU. Such notice must include the rationale for any proposed adjustments under paragraph (E)(4)(e) of this rule to the treatment standards in paragraph (E)(4)(d) of this rule.	CAMU will be included in the Waste Disposition Proposed Plan/ROD process and in the Deferred Units Preferred Plan/Decision Document process. Public Comment will be addressed.

3745-57-72 Corrective Action Management Units (CAMUs) (Continued)

RULE	DOE Approach
(I) Notwithstanding any other provision of this rule, the director may impose additional requirements as necessary to protect human health and the environment	Acknowledged.
(J) Incorporation of a CAMU into an existing permit must be approved by the director according to the procedures for permit modifications under rule 3745-50-51 of the Administrative	Not applicable.
(K) The designation of a CAMU does not change Ohio EPA's existing authority to address clean-up levels, media-specific points of compliance to be applied to remediation at a facility, or other remedy selection decisions.	Acknowledged.

AOC = area of contamination
ARAR = applicable or relevant and appropriate requirement
CAMU = Corrective Action Management Unit
COPC = chemical of potential concern
D&D = decontamination and decommissioning
DFF&O = *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto*
DNAPL = dense non-aqueous phase liquids
DOE = U.S. Department of Energy
ELCR = excess lifetime cancer risk
FR = Federal Register
GCL = geosynthetic clay liner
GDP = gaseous diffusion plant
GML = geomembrane liner
HDPE = high density polyethylene
HQ = hazard quotient
ILTS = Interim Leachate Treatment System
IMTA = impacted material transfer area
LDR = land disposal restriction
Ohio EPA = Ohio Environmental Protection Agency
OSDC = on-Site disposal cell
PHC = principal hazardous constituent
PLTS = Permanent Leachate Treatment System
PORTS = Portsmouth Gaseous Diffusion Plant
RCRA = Resource Conservation and Recovery Act of 1976, as amended
RFI = RCRA Facility Investigation
RI/FS = Remedial Investigation/Feasibility Study
ROD = Record of Decision
TCE = trichloroethene
TCLP = Toxicity Characteristic Leaching Procedure
T/S = treatment/storage
T/S/D = treatment/storage/disposal
U.S. EPA = United States Environmental Protection Agency
WAC = waste acceptance criteria

APPENDIX C: IDENTIFICATION OF ANTICIPATED CAMU-ELIGIBLE WASTE STREAMS ASSOCIATED WITH THE PORTS CLEANUP

ACRONYMS

CAMU	Corrective Action Management Unit
DFF&O	*The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto*
DOE	U.S. Department of Energy
PCB	polychlorinated biphenyl
PORTS	Portsmouth Gaseous Diffusion Plant
RAD	radiological
RCRA	Resource Conservation and Recovery Act of 1976, as amended
TSCA	Toxic Substances Control Act of 1976

Appendix C describes the U.S. Department of Energy's (DOE's) evaluation process to determine the Corrective Action Management Unit (CAMU) eligibility of materials generated at the Portsmouth Gaseous Diffusion Plant (PORTS) during overall cleanup. This appendix is a regulatory road map of all anticipated waste materials generated from both *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) and non-DFF&O cleanup activities. The appendix organizes the origin of the anticipated waste streams into four major categories: building contents, the building structures, contaminated fill, and remaining contaminated environmental media. Within each category, specific waste sources are identified and each is identified with one of 12 different regulatory waste types (e.g., "Radiological (RAD) Free: [Resource Conservation and Recovery Act of 1976, as amended] RCRA hazardous", "RAD Contaminated: RCRA Non-Hazardous Construction Demolition Debris").

This road map is designed to be a quick reference and a summary of a very complex regulatory evaluation process conducted by DOE for all DFF&O and non-DFF&O anticipated waste streams.

Key:

The 4 Major Material Origin Categories:

1) Material Origin Category #1: **Building Contents**

2) Material Origin Category #2: **Building Structures**

3) Material Origin Category #3: **Contaminated Fill** from four PORTS contaminated sources (residual soil defined in the DFF&O; deferred unit soil/closure of the firing range; targeted plume soil; and targeted landfill excavation)

4) Material Origin Category #4: Additional Ohio Consent Decree **Contaminated Environmental Media** needing removal after fill needs are met

The 12 Major Regulatory Waste Types:

1) RAD Free: RCRA Hazardous (Listed or Characteristic) – CAMU Ineligible

2) RAD Free: RCRA Hazardous (Listed or Characteristic) – CAMU Eligible

3) RAD Free: RCRA Non Hazardous Toxic Substances Control Act of 1976 (TSCA) contaminated materials (polychlorinated biphenyl [PCB] wastes)

4) RAD Free: RCRA Non-Hazardous Construction Demolition Debris

5) RAD Free: RCRA Non-Hazardous Solid Wastes

6) RAD Contaminated: RCRA Hazardous (Listed or Characteristic) – CAMU Ineligible

7) RAD Contaminated: RCRA Hazardous (Listed or Characteristic) – CAMU Eligible

8) RAD Contaminated: RCRA Non-Hazardous TSCA contaminated materials (PCB wastes)

9) RAD Contaminated: RCRA Non-Hazardous Construction Demolition Debris

10) RAD Contaminated: RCRA Non-Hazardous Solid Wastes

11) Nuclear Products in Inventory

12) Non-Waste Materials Considered as Potential Recycle Materials

Note: All quantities are in cubic yards.

CAMU INELIGIBLE								
Item No.	**Regulatory Waste Type**	**Examples**	**Estimated Quantities in RI/FS - On Site**	**Estimated Quantities in RI/FS - Off Site**	**3745-57-72(D)(1) - Description of Origin of Waste, and Description of Timing and Circumstances of Disposal/Release**	**3745-57-72(D)(2) – Was Waste Identified as Hazardous at the Time of Disposal/Release?**	**3745-57-72(D)(3) – Did Disposal/Release Occur Before or After Land Disposal Requirements of Chapter 3745-270?**	**3745-57-72(A)(1) - Is the Waste CAMU-Eligible?**
1. Building Contents								
1.1	RAD Free: RCRA Hazardous (Listed or Characteristic) And RAD Free: RCRA Non-Hazardous Solid Wastes (only the daily trash component)	As generated wastes: -RCRA Wastes in Containers (e.g., RCRA Storage or Satellite Accumulation Areas) and -RCRA Hazardous Lab Chemicals from on-Site laboratory operations, both generated during industrial operations, and -Solid waste generated as daily trash during industrial operations	0	354	Waste was/is generated during process operations and will be removed from the building in preparation for structure demolition.	Waste is newly generated and evaluated at the time of generation to determine proper waste management requirements. Waste is not released or disposed on Site, but sent to appropriate off-Site permitted disposal facilities.	N/A. There was no on-Site disposal or any release of this waste category. Waste is newly generated during D&D activities for on-Site disposal.	No
1.6	RAD Contaminated: RCRA Hazardous (Listed or Characteristic)	RAD contaminated containerized wastes and above-grade tanks and materials Incidental MLLW generated during operations of RCRA-permitted area	0	114	Waste was/is generated during process operations and will be removed from the building in preparation for structure demolition.	Waste is newly generated and evaluated at the time of generation to determine proper waste management requirements. Waste is not released or disposed on Site, but sent to appropriate off-Site permitted disposal facilities.	N/A. There was no on-Site disposal or any release of this waste category. Waste is newly generated during D&D activities for on-Site disposal.	No

D.1 INTRODUCTION

Appendix D presents the information to identify the chemicals of potential concern (COPCs) at the Portsmouth Gaseous Diffusion Plant (PORTS), develop a principal hazardous constituent (PHC) limit for each COPC based on a future exposure scenario for an outdoor worker, screen existing soil data against the calculated PHC limits to identify COPCs that exceed the PHC limit, and estimate the soil volumes associated with the COPCs that exceed the PHC limit. Information generated from this screening process will be used to evaluate Corrective Action Management Unit treatment strategies for the proposed waste disposal alternatives.

D.1.1 SELECTION OF COPCS

The COPCs for PORTS have been compiled and evaluated in the *Methods for Conducting Human Health Risk Assessments and Risk Evaluations at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (U.S. Department of Energy [DOE] 2013). COPCs in the risk document are based on chemicals used in historic PORTS operations and the known chemicals in soil and groundwater contamination areas; other COPCs may be added as the remediation process progresses. Calculation of the PHC threshold value was performed for those COPCs in the risk document that also appear in the Resource Conservation and Recovery Act of 1976, as amended (RCRA) D- and F-listed tables (Table D.1). Carcinogenic COPCs in Table D.1 are identified by italicized text.

Table D.1. COPCs in the PORTS Risk Document that Appear in the RCRA D- and F-listed Tables

Acetone	Dichloroethylene 1,2-cis-	Trichloroethylene
Benzene	Dichloroethylene, 1,2-trans-	Trichlorofluoromethane
Carbon Disulfide	*Dinitrotoluene 2,4-*	*Vinyl Chloride*
Carbon Tetrachloride	Endrin	Xylene
Chlorodane, alpha	*Heptachlor*	*Arsenic*
Chlorodane, gamma	*Heptachlor Epoxide*	Barium
Chlorobenzene	*Hexachlorobenzene*	Cadmium
Chloroform	*Hexachlorobutadiene*	Chromium(III)
Cresol, p-	*Lindane*	*Chromium(VI)*
Dichlorobenzene, 1,4-	Methoxychlor	Cyanide
Dichlorodifluoromethane	Methylene Chloride	Lead
Dichloroethane, 1,1-	*Nitrobenzene*	Mercury, Elemental
Dichloroethane, 1,2-	Tetracholorethylene	Mercury, Inorganic Salts
Dichloroethylene, 1,1-	Trichloroethane, 1,1,1-	Selenium
Dichloroethylene, 1,2-	Trichloroethane, 1,1,2-	Silver

D.1.2 EXPOSURE SCENARIO, PARAMETERS, AND LIMITS

The outdoor worker is the reasonable maximum exposure scenario for evaluating threats to human health from residual contaminant levels remaining in the soil after remedial actions because the future land use for PORTS is designated as industrial. Receptor exposure pathways applicable to soil media include ingestion of soil, inhalation of particulate suspended by wind, and dermal absorption. Exposure parameters for the outdoor worker (Table D.2) reflect the U.S. Environmental Protection Agency (EPA) 2014a recommended values. Chemical-specific slope factors, reference doses, absorption factors, and volatilization factors for the COPCs are provided in the PORTS risk document (DOE 2013).

Table D.2. Exposure Parameters for the Outdoor Worker Scenario

		Exposure Parameters	Value	Units
IRS	=	ingestion rate of soil	100	mg/day
EF	=	exposure frequency	225	days/yr
ED	=	exposure duration	25	yrs
ET	=	exposure time	8	hrs/day
BW	=	body weight	80	kg
AT_c	=	averaging time - cancer	25,550	days
AT_n	=	averaging time - noncancer	9,125	days
SA	=	skin surface available for contact	3,470	cm^2/day
AF	=	adherence factor	0.12	mg/cm^2
ABS	=	absorption factor	COC specific	unitless
PEF	=	particulate emission factor	1.24E+09	m^3/kg

PEF applies to a 0.5 acre exposure area

COC = contaminant of concern

For the PHC calculations (Section D.1.3), an excess lifetime cancer risk (ELCR) of 10^{-3} will be used for chemicals classified as carcinogens and a hazard index (HI) of 10 will be used for non-carcinogens. These proposed ELCR and HI limits for PHCs are defined in the Federal Register (Volume 65, #163, 22 August 2000, Part III, Section G, Paragraph e).

D.1.3 PHC THRESHOLD VALUES

Threshold values for the PHCs were calculated using the equations and chemical-specific slope factors, reference doses, absorption factors and volatilization factors provided in the PORTS risk document. The starting point is Appendix B of the risk document, where soil screening levels are tabulated for the COPCs identified in Table D.1 at an ELCR of 10^{-6} and HI of 0.1. For the COPCs in Table D.1, values from Table 2 of Appendix B of the PORTS risk document are listed in Table D.3. Using the EPA 2014a recommended exposure parameters for an outdoor worker (Table D.2), and equations and chemical-specific values in the PORTS risk methods document, the values in Table 2 of Appendix B of the PORTS risk document were updated to account for the EPA 2014a exposure parameters (Table D.3). PHC threshold values were calculated by multiplying the EPA 2014a updated values by 1,000 for carcinogens and by 100 for non-carcinogens. Calculated PHC values appear in the last two columns of Table D.3.

Final adjustments to the present COPC list and PHC threshold values in Table D.3 were made after reviewing screening results and removing COPCs that had no detects or those with a few detects that are orders-of-magnitude below the PHC limit; and after considering regulatory input from the Ohio Environmental Protection Agency (Ohio EPA).

Several notes apply to this short list of COPCs and PHC limits (Table D.4):

- Total chromium results for soil samples will be compared to the PHC limit for chromium (VI).
- Lead was added to the COPCs and the PHC limit is based on the EPA soil screening level of 800 mg/kg (EPA 2014b) for an industrial use scenario.
- The PHC limit for elemental mercury is the value recommended by Ohio EPA.

Table D.3. Derivation of PHC Limits for Ports COPCs – Outdoor Worker Exposure Scenario

D.2 PHC SCREENING PROCESS

D.2.1 SOIL DATA

D.2.1.1 Historical Soil Data Set

The historical soil data set is defined as data collected after January 1991 that is associated with a quality assurance sampling and analysis plan. This data set covers actions under the Consent Decree and *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation* *and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O) and has 152,937 results for the 45 COPCs listed in Table D.3. Information covered under the Consent Decree is shown simply to convey the entire snapshot of present soil sample results at PORTS. Locations for the reported results are shown on Figure D.1.

A comparison of the 152,937 results to the PHC limits in Table D.3 yielded the following metrics for each COPC: number of results, number of detected results, number above the PHC limit, percent above the PHC limit, minimum result, maximum result, PHC limit, and the ratio of maximum detect to PHC limit (Table D.5). Presently, trichloroethene (TCE) is the only COPC with soil results above its PHC limit (red dots on Figure D.1). As soil remediation activities progress, additional COPCs could be defined as PHCs.

D.2.1.2 Residual Soil Data Set

The residual soil data set (a subset of the historical soil data set) applies only to remedial actions covered under the DFF&O, and includes data collected after January 1991 that is associated with a quality assurance sampling and analysis plan. Sample locations for this data set are provided as shown on Figure D.2 and indicate that a portion of the TCE results that exceed the PHC limit are captured in the residual data set and the rest are within the X-701B plume area.

Figure D.2. Sample Locations for the Residual Soil Data Set

D.2.2 SCREENING RESULTS

D.2.2.1 Identified PHC

Table D.5 results show, at this point in the soil remediation process, that the only COPC to exceed its PHC limit is TCE with 108 of 8,125 results (1.33 percent) above the PHC limit of 282 mg/kg. The maximum TCE value (110,000 mg/kg) is 390 times greater than the PHC limit.

D.2.2.2 PHC Distribution and Estimated Soil Volume

Figure D.3 shows the distribution of the 108 soil samples that exceed the PHC limit for TCE and the corresponding soil volume associated with these samples (gold pattern, which is partially overlain by green and purple areas). Most of the samples are associated with 52 locations in the high-concentration zone of the X-701B TCE groundwater plume, and the remaining samples are tied to six locations in the TCE plume emanating from the northeast corner of Building X-720. The volume of soil impacted by TCE that exceeds the PHC limit is estimated using the surface area that circumscribes the data points and extending this area downward until the deepest sample point is captured (cookie-cutter approach). Soil volume estimates derived with the cookie-cutter approach (Figure D.3) will overestimate the actual volume of impacted soil because the extent of subsurface contamination is shaped like an inverted funnel.

Soil volumes that correspond to samples that exceed a TCE level of 500 and 5,000 mg/L are shown by the green and purple patterns (Figure D.3). Approximately one-half of the total PHC volume corresponds to samples that exceed 500 mg/kg. The estimated volume for samples that exceed 5,000 mg/kg is less than 1 percent of the PHC volume.

Figure D.3. Soil Volumes for TCE-contaminated Areas that Have Samples Greater than the PHC Limit

Appendix E develops the appropriate treatment standard for trichloroethene (TCE)-contaminated soil. TCE was identified in Appendix D as the sole principal hazardous constituent (PHC) requiring development of a Corrective Action Management Unit (CAMU) treatment standard.

The treatment standards required under *Ohio Administrative Code (OAC)* 3745-57-72 (E)(4)(d) or that can be justified under *OAC* 3745-57-72 (E)(4)(d) are determined in consideration of the site's geological data, on-Site disposal cell (OSDC) design, and previous Portsmouth Gaseous Diffusion Plant (PORTS) experience in TCE treatment, associated costs, and technical difficulties encountered during those treatment efforts. A recommendation is made based on the comparison of the results of the evaluations.

E.1 MINIMUM TREATMENT REQUIREMENTS

TCE-contaminated soils are expected to be generated during decontamination and decommissioning (D&D) or soil remediation. Unless TCE-contaminated soils can be placed in a CAMU, the soils would be subject to the treatment requirements of *OAC* 3745-270. In order for TCE-contaminated soils to be placed in a disposal CAMU designated by the Ohio Environmental Protection Agency (Ohio EPA) Director, PHCs must be treated to the standards specified in *OAC* 3745-57-72(E)(4)(d) or (E)(4)(e). Soil treatment could be implemented in situ during excavation in the area of contamination (AOC) or ex situ in a storage and/or treatment CAMU.

Based on the PORTS PHC screening results presented in Appendix D of this Site-wide Waste Disposition Evaluation Project (Waste Disposition) Remedial Investigation/Feasibility Study (RI/FS) Supplement, TCE is the only known contaminant in soil which exceeds a PHC screening value at PORTS. Most of the identified PHC screening value exceedances are located in the western portion of the X-701B TCE plume area as shown in Figure D.3. There are also two other locations, one under the X-720 and the other just east of the X-700 buildings, with TCE as a PHC in soil. Soils at these two locations must be excavated as an integral part of the remedial action of the below-grade building structures, sump, and associated utilities of X-720 and X-700 and are considered residual soil as defined in *The April 13, 2010 Director's Final Findings and Orders for Removal Action and Remedial Investigation and Feasibility Study and Remedial Design and Remedial Action, including the July 16, 2012 Modification thereto* (DFF&O). Any soil which must be excavated and is not residual soil as defined by the DFF&O will be under the regulatory authority of the Consent Decree or other authorities. The six locations exceeding TCE PHC conditions under the X-720 are located above the groundwater table.

The information below evaluates the treatment standards required for TCE in these soils for disposal in the potential OSDC, if selected and designated as a CAMU in compliance with *OAC* 3745-57-72.

E.1.1 *OAC* 3745-270-48 STANDARD

The universal treatment standard (UTS) for TCE-contaminated nonwastewater wastes, as specified in *OAC* 3745-270-48, is 6.0 mg/kg, measured by an analysis of grab samples. This standard is not applicable to CAMU-eligible soils to be generated and placed in the potential OSDC during D&D and soil remediation at PORTS under Alternative 2 of the Waste Disposition RI/FS report, if the OSDC is designated as a CAMU by the Ohio EPA director.

E.1.2 *OAC* 3745-57-72(E)(4)(d) CAMU TREATMENT STANDARD

Under (E)(4)(d), treatment must achieve 90 percent reduction in total PHC concentrations but not lower than 10 times the UTS (i.e., 60 mg/kg for TCE-contaminated soil).

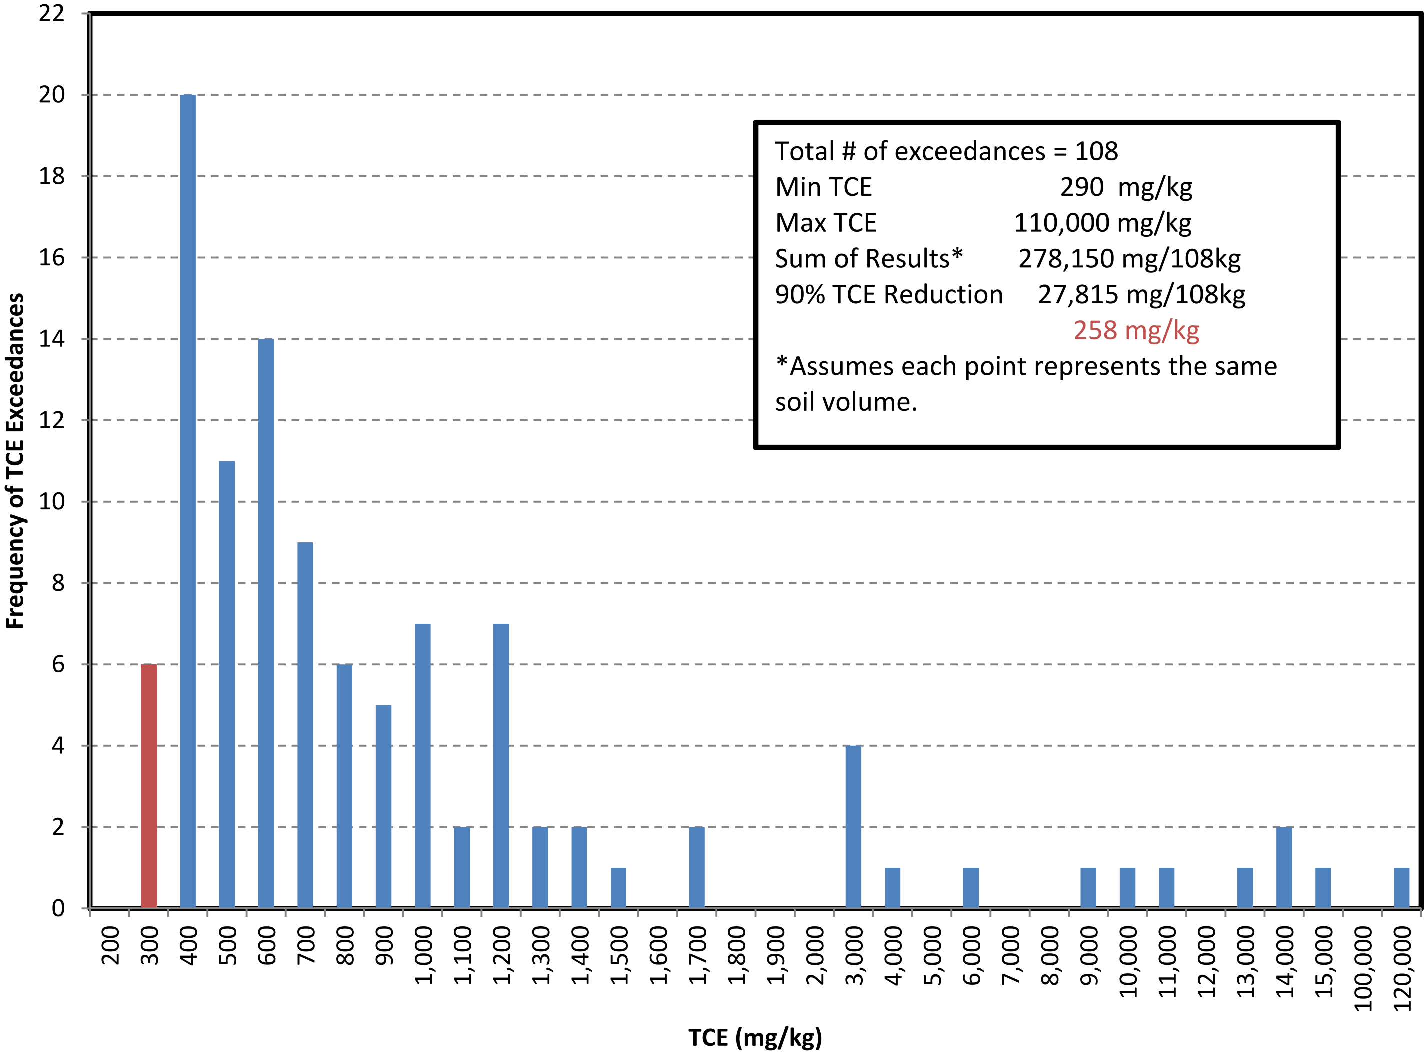
Figure E.1 shows a histogram of all 108 TCE soil data above the PHC threshold value of 282 mg/kg (as described in Appendix D). Figures E.2, E.3, and E.4 show histograms of the TCE soil data under X-720/X-700 (11 data points) (U.S. Department of Energy [DOE)] 2001, DOE 2010), in X-701B (96 data points) plume area, and in X-720 alone (six data points), respectively, above the PHC threshold value of 282 mg/kg. (Data in the bottom of the X-701B impoundment was collected by Geraghty & Miller and Science Applications International Corporation and documented in an internal document that presented concentrations of TCE in soils from the bottom of the pond to the top of Sunbury Shale. The objective of the sampling was to identify any zones of dense non-aqueous phase liquid (DNAPL) pockets in the vertical sequence within the pond boundary.) A single data point is located near X-231A/B, which is not included in the above-mentioned statistics, except in Figure E.1.

To achieve 90 percent reduction in total PHC concentrations, a treatment target range of about 250 to 700 mg/kg would be required. This is based on the assumption that each result greater than the PHC threshold is associated with an equal volume of soil. The treatment standard, as applied on a regulatory unit basis, would only vary within a limited range of treatment values. However, using these unit specific standards in relation to disposal into the CAMU doesn’t have technical merit based on the small differences in toxicity reduction between units. For cases such as PORTS, the U.S. Environmental Protection Agency (EPA) anticipated that selecting a site-wide alternative treatment standard using the zone of reasonable treatment values (See 28556 Federal Register / Vol. 63, No. 100 / Tuesday, May 26, 1998 / Rules and Regulations and Amendments to the Corrective Action Management Unit Rule, 65 FR 51080, Tuesday, August 22, 2000) is sufficient for demonstrating treatment. Therefore, collectively, the 10th percentile rank is approximately 500 mg/kg, resulting in a site-wide treatment target of about 500 mg/kg, which would be required to achieve 90 percent reduction in PHC concentrations.

Based on the information presented above, it is logical to assume that regardless of the future regulatory decisions and authorizations for DFF&O residual soil or Consent Decree soil at PORTS, if excavated, a treatment target close to 500 mg/kg for TCE-contaminated soil would be required to satisfy the 90 percent reduction in PHC concentrations under *OAC* 3745-57-72(E)(4)(d) prior to disposal in the potential OSDC, if selected and designated as a CAMU. Under this scenario, a total of 29,000 cy of soil would need to be treated, as shown in Figure D.3. However, DOE has concluded, as described in more detail below, that it is not cost effective to achieve this treatment target at PORTS to support placement of D&D wastes in the potential OSDC. DOE believes an adjusted standard under (E)(4)(e) is appropriate based upon the following analysis.

OAC 3745-57-72(E)(4)(d) Treatment Standards Technical Feasibility and Cost Evaluation

Due to the well-known geological characteristics of Minford clay such as very fine grain, low effective porosity, low permeability, high plastic index, and high water holding capacity, large scale treatment of TCE-contaminated Minford clay soils at PORTS, either in situ or ex situ, to reduce concentrations from well over 5,000 mg/kg (e.g., 15,000 mg/kg measured in vadose zone under X-720) down to 500 mg/kg of TCE at the pace necessary to support D&D waste placement in the potential OSDC may not be feasible. This section reviews the lessons learned from previous soil remediation efforts involving treatment of TCE-contaminated soils at PORTS and other sites and demonstrates that efforts by DOE to meet the *OAC* 3745-57-72 (E)(4)(d) treatment standards are not technically feasible or economically reasonable.



Total # of exceedances = 108
Min TCE 290 mg/kg

E.1.3 TECHNOLOGIES AND EFFECTIVENESS

The Federal Remediation Technologies Roundtable (FRTR) was formed to build a collaborative atmosphere among federal agencies involved in hazardous waste site cleanup. The FRTR brings together federal cleanup program managers and other remediation community representatives to:

- Share information and learn about technology-related efforts of mutual interest
- Discuss future directions of the national site remediation programs and their impact on the technology market
- Interact with similar state and private industry technology development programs
- Form partnerships to pursue subjects of mutual interest.

FRTR members/agencies include the EPA, DOE, U.S. Department of Defense, U.S. Department of the Interior, and National Aeronautics and Space Administration.

The FRTR has identified several ex situ soil treatment technologies as viable candidates for treating contaminated soils at Federal sites. The main advantage of ex situ treatment is that it generally requires shorter time periods than in situ treatment, and there is more certainty about the uniformity of treatment because of the ability to homogenize, screen, and continuously mix the soil. Ex situ treatment, however, requires excavation of soils, leading to increased costs and engineering for equipment, possible permitting, material handling and worker protection measures.

The FRTR identified ex situ soil treatment technologies include: thermal desorption, oxidation/reduction, and gravity separation. DOE has experience with each of these technologies at PORTS, attempted historically, without success, for the treatment of contaminated soils. As presented below, there are limitations and implementation issues associated with each of these technologies that need to be considered.

Enhanced Soil Mixing With Thermal Desorption & Oxidation/Reduction

Beginning in 1992, Enhanced Soil Mixing was conducted at the X-231B to evaluate the technical and cost effectiveness of using this technology for the removal of volatile organic compounds (VOCs). The results are summarized in *Remediation Case Studies: Soil Vapor Extraction and Other In Situ Technologies* (EPA 542-R-97-009), *In Situ Enhanced Soil Mixing* (DOE/EM-0289), and *In Situ Treatment of Contaminated Clay Soils* (ERP-TI/92-359). Although the technology demonstration was conducted in situ, the results are applicable to ex situ treatment of similar soil horizons.

X-231B was used from 1976 to 1983 for treatment and disposal of waste oils and degreasing solvents, and these contributed to contamination of soil and shallow groundwater with VOCs. Thirteen VOCs were identified in the soil, including TCE, trichloroethane (TCA), 1,2-dichloroethylene, and methylene chloride, at concentrations ranging from several hundred to several thousand µg/kg. The site consists of relatively low permeability soils with elevated clay content.

The following four technologies were demonstrated at X-231B: vapor extraction with ambient air stripping, vapor extraction with hot air stripping, hydrogen peroxide injection, and grout injection for solidification/stabilization. Three demonstration soil columns were completed for each of the four technologies. The 12 soil columns were each 10 ft in diameter and 15 ft deep. One additional column was treated by hot air stripping to a depth of 22 ft, and a second additional column was used for a tracer study.

Soil mixing with hot air (thermal) stripping was selected as the remedial option for the site, and cleanup and closure was completed in 1994. 628 soil columns at a depth of 22 ft were treated during remediation.

Unfortunately, the cost and schedule impacts for all of these technologies were high, and as a result, they have not been considered effective for future full-scale soil treatment at DOE sites. The estimated treatment efficiency, production rate, and full scale unit cost for remediation ranged from a rate between 15 to 45 cy/hr with a cost range of $45 to $60/cy.

Enhanced Gravity Separation – Vadose Zone Soils

The X-701B was constructed with the plant and used as an unlined 200-ft by 50-ft retention basin for the neutralization and settling of metal-bearing waste water, solvent-contaminated solutions, and acidic wastewater. Most of the waste discharged to the pond originated at the X-700 Chemical Cleaning Facility and the X-705 Decontamination Building. Wastes received by the holding pond included nitric acid and chromic acid. Also discharged to the pond were TCE and TCA, both of which were typically co-contaminated with technetium and uranium. The pond was in use from 1954 until 1988.

An X-701B Interim Remedial Measure (IRM) was initiated in 2009 and completed in 2011. The purpose of the project was to perform mixed oxidant treatment of TCE-contaminated soils within the large, high concentration groundwater plume that originated from X-701B. The results of the IRM are summarized in *Completion Report for the X-701B Solid Waste Management Unit Interim Remedial Measure – Oxidant Mixing at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio* (DOE 2011).

During the IRM, the targeted soils for treatment were super-saturated and overlaid by non-Resource Conservation and Recovery Act of 1976, as amended (RCRA)-regulated vadose zone soils composed of Minford silt and clay and approximately 10 ft to 12 ft in depth. Like X-231B, these soils have a relatively low permeability and elevated clay content. Dewatering of the vadose zone soils is discussed in this section, and dewatering of the targeted saturated soils is discussed in the section below.

In order to proceed with the desired treatment, the vadose zone soils were removed and stored at a nearby location and allowed to gravity dewater in preparation for replacement following completion of the IRM. The area of treatment for the IRM was approximately 4.75 acres, and the vadose zone soils totaled approximately 76,710 cy. These soils were above the water table of the plume, and so were not super-saturated except for the portion of the layer which was in direct interface with the water table. The properties of these soils caused them to be significantly above optimum moisture for replacement and compaction. Consideration was given to this over-wet condition when stockpiling the soils at the storage location, and a location was selected which provided positive drainage to allow the soils to naturally release free liquid via gravity. Additionally, the surface of the stockpile was ripped with a bulldozer as weather conditions permitted to allow exposure to the sun and wind for drying. The pile was always resealed at the end of the day shift to prevent resaturation from precipitation.

When the IRM had progressed to a point in the spring of 2011 where the vadose zone soils could be replaced over the oxidant treated soils, it was apparent that gravity drainage had been successful in removing the free liquids from the stockpiled soils. The outer limits of the stockpile were partially dry, while the inner portions of the pile were still above optimum moisture content, which required drying techniques to be implemented for the purposes of this remedy. Additionally, a wet spring complicated drying efforts. Initially, the soils were spread in 6-in. to 8-in. lifts on the placement area, and processing of the material was begun using a rotary tiller. The results of this method were unsatisfactory due to the limited speed and size of the tiller, which didn’t allow adequate drying prior to resealing at the end of shift. The tiller was then used in combination with a bulldozer windrowing the material to expose more surfaces to the air. This process yielded better results, but additional speed of processing was needed to keep the project on schedule.

An agricultural tractor and disc were brought in to more quickly turn the soil in support of the bulldozer. This was done on both the placed soil lift and the surface of the stockpile, which provided two simultaneous drying platforms. The result was that although treatment costs increased, efficiency was greatly enhanced, enabling the project to move forward between periods of wet weather.

Therefore, it was demonstrated by this IRM that free liquids can be drained from Minford soils in the vadose zone using gravity separation. However, achievement of optimum moisture content for placement purposes requires enhanced gravity separation with the application of extensive soil mixing/drying techniques. Although the unit cost for this treatment was not tracked, it was accomplished over approximately a 2-month period, primarily with equipment already at the worksite, and with approximately 800 man-hours of additional labor.

Enhanced Gravity Separation – Saturated Zone Soils

The excavation and treatment of targeted contaminated soils within the X-701B IRM was conducted on a cell-by-cell basis with a total of 81 cells. A combination of open excavation with laid-back slopes and shoring panels was used to remove, treat, and replace the saturated soils in each cell which were a mixture of Minford and Gallia. Within each cell, excavation of the soils progressed with removal of the top 10 ft of non-regulated soils as addressed in the previous section, followed by the middle soils (approximately 20 ft) which were excavated and spread out on the contaminated land surface within the treatment zone for gravity drainage and treatment.

The bottom 1 to 2 ft of the Gallia sand and gravel and the top of the Sunbury shale in each cell were then tilled in place with a tilling/cutting attachment mounted on the end of a long-reach excavator. After approximately 10 to 20 minutes of tilling, Modified Fenton's Reagent was slowly applied to the soils for approximately an additional 1 to 2 hours while the tilling was continued. To achieve the desired results, the tilling and treatment process was repeated several times for some cells.

Following the tilling and treatment process, each cell was backfilled with the middle soils that had been previously excavated as described above. Prior to backfilling, the middle soils were processed with a rotary tiller/cutting attachment, and simultaneously mixed with granular sodium persulfate and hydrated lime. The application of hydrated lime was sometimes repeated multiple times in order to dry the soil to a point where placement was possible. In some cases, extensive tilling was required prior to placement.

In general, gravity drainage of the middle soils within the treatment area was successful in removing free liquids; however, the middle saturated soils remained well above optimum moisture content, and often remained well above optimum moisture content after extensive and costly measures had been taken to process them.

The targeted saturated soils for the IRM totaled approximately 167,500 cy, and the IRM took approximately 17 months to complete. The unit cost for treatment of the saturated soils was not tracked; however, the overall cost of the entire X-701B IRM was on the order of $50 million. It has been estimated that overall, the drying and treatment of the saturated zone soils was roughly an order of magnitude more costly and time consuming than the vadose zone soils. The total cost for treatment of all IRM soils (vadose zone and saturated) was approximately $205/cy in unescalated dollars.

E.1.4 EXPERIENCE AT PIKE SANITATION LANDFILL

Experience with the Minford soil at Pike Sanitation Landfill has shown that it tends to hold together very well. It is difficult to reduce the moisture from within the soil matrix as it is "sticky" in nature. The key to removing the moisture is repeated working of the soil to create as large of a surface area as possible to expedite the evaporation of moisture from the soil. This information was provided by Ohio EPA technical staff overseeing operation of the facility and some of PORTS technical staff members' actual working experience at the facility.

E.1.5 POTENTIAL COST AND DURATION TO ACHIEVE (E)(4)(D) STANDARD FOR TCE

Based on the historical costs with escalation (i.e., up to $250/cy) and production rates (i.e., 15 to 20 cy/hour) from previous soil treatment efforts at PORTS, it is expected that it may take at least $5 million and 60 weeks to achieve the 500 mg/kg target for 29,000 cy of TCE-contaminated soil with concentrations above 500 mg/kg (See Figure D.3). This cost and schedule duration would be in addition to the normal cost and duration for excavating and handling the soil.

None of the previous efforts at X-701B actually recovered TCE-free product, which is expected to be located in the weathered Sunbury shale. Any future efforts will need to more thoroughly locate, recover, and dispose of this significant continuous source of groundwater contamination. Additional cost would be required to treat excavated Sunbury shale to 500 mg/kg from concentrations in soil of more than 10,000 mg/kg.

Based on the experience with these technologies at PORTS, and considering the additional cost and schedule impacts, use of these technologies is not considered feasible to support using the contaminated fill in the OSDC. The acquisition of soil for fill must reasonably match the generation of D&D waste to be placed in the potential OSDC. The production rate of fill soil with treatment of TCE to achieve 500 mg/kg will be far below the rate required to support active D&D waste placement rate in the potential OSDC.

A storage and treatment CAMU would likely also need to be constructed with double liner and leachate collection system in compliance with *OAC* 3745-57-72(F) to treat the TCE-contaminated soil from X-720 and X-700 in order to separate the treatment operation from the D&D activities. This will require double or triple handling of the excavated soil. The more significant radiological contaminations in X-720 and X-700 areas may increase the unit cost by a factor of two to accommodate additional radiological protections for workers conducting the treatment. The production rate will also be further reduced.

Overall, the cost to achieve the (E)(4)(d) standard for TCE PHC soils at PORTS is likely to be up to an extra $10 million, along with an additional hotel load cost and 2 years of effort. With that comes the added short-term risk to the worker, as described in the main text of this Supplement. This standard, if implemented, will significantly delay the D&D schedule by taking away funding from D&D or OSDC construction activities for expensive soil treatments. Even with additional funding it may not support the D&D schedule. For example, soil will not be available from the X-701B plume area in time to support initial X-326 D&D waste placement in the OSDC, which is the first process building planned to be demolished at PORTS. Therefore DOE may be forced to use clean fill to place X-326 D&D wastes in the OSDC in order to keep D&D activities on track, if this standard is imposed.

E.2 *OAC* 3745-57-72(E)(4)(e) ADJUSTED STANDARD

The *OAC* 3745-57-72(E)(4)(e) allows considerations of specific factors and benefits to justify adjusted standards that are practical, more timely, less risk to workers, protective in the disposal CAMU, and cost-effective. This section presents detailed soil geological characteristics at PORTS and provides technical justifications to a proposed adjusted standard for TCE PHC soils identified in Appendix D.

E.2.1 PHYSICAL CHARACTERISTICS OF SOIL WITH PHC

Prior to the Pleistocene glaciations, the Teays River and its tributaries were the dominant drainage systems in Ohio. The Teays River flowed southeast to northwest passing approximately 3 miles north of the location now occupied by PORTS. The Portsmouth River, a tributary of the Teays River, flowed north across the plant site location between bluffs of Cuyahoga shale. The Portsmouth River downcut through the Cuyahoga and into the Sunbury (shale) and Berea (sandstone) Formations and deposited fluvial silty sands and gravels of the Gallia member of the Teays Formation. About 1 million years ago, a glacier advancing from the north blocked the northwestward flow of the Teays River that resulted in the creation of Lake Tight, which filled the valleys of the Teays River and its tributaries, including the Portsmouth River. Lacustrine silt and clay (Minford member of the Teays Formation), indicative of low-energy conditions, were deposited on the lake bottom overlaying the meandering stream deposits of the Gallia. As a result the unconsolidated sediments of the Teays Formation are divided into two members: the Minford clay and silt and the Gallia sand and gravel.

E.2.1.1 Minford Clay and Silt

The basal 10 to 15 ft of the Minford commonly consist of relatively clean silt, perhaps reflecting shallow lake levels and reworked sediment or possibly Portsmouth River over-bank deposits. Above this silt layer lays a series of laminated clays that may represent sediments deposited as the glacial Lake Tight grew deeper and more extensive. The Minford averages 20 to 30 ft in thickness at the PORTS facility. The upper clay unit averages 16 ft in thickness, is reddish-brown, silty, and plastic, and contains traces of sand in some locations. The lower silt unit averages 7 ft in thickness, is yellow-brown, semi-plastic, and contains varying amounts of clay and very fine sand. A former study (Law Engineering 1978) estimated the silt content in the Minford as a whole at approximately 33 percent. Based on data presented in this study, the following observations were noted:

- The Minford overall consists of about 67 percent clay and 33 percent silt.
- Minford soils have an in situ moisture range of 3 to 12 percent above optimum moisture content.
- In general, clay soils have an affinity to produce capillary action (i.e., tend to absorb moisture) up to the liquid limit. The in situ moisture content of Minford soils range from 1.6 to 36 percent below their liquid limits with an average of 15.4 percent below. Therefore, Minford soils will not readily release water.

The dry bulk density of most soils varies within the range of 1.1 to 1.6 g/cm^3 (Hillel 1980). Based on PORTS geology, the Minford could be described as a clay loam or silty clay loam. The typical dry density value for clay loam and silt loam soil types is 1.28 g/cm^3 (Linsley et al. 1982; Poffijn 1988). The typical total porosity ranges for clays are 0.40 to 0.70 (Freeze and Cherry 1979) and 0.34 to 0.57 with an arithmetic mean of 0.42 (McWorter and Sunada 1977), whereas the total porosity of silts ranges from 0.34/0.35 to 0.50/0.51 (Freeze and Cherry 1979; McWorter and Sunada 1977) with an arithmetic mean of 0.45. In naturally porous systems such as subsurface soil, where the flow of water is caused by the composition of capillary, molecular, and gravitational forces, the effective porosity can be approximated by the specific yield, or drainage porosity, which is defined as the ratio of the volume of water drained by gravity from a saturated representative sample of the soil to the total volume of the sample. The effective porosity of clays ranges from 0.01 to 0.18 with an arithmetic mean of 0.06, whereas the effective porosity of silts ranges from 0.01 to 0.39 with an arithmetic mean of 0.20 (McWorter and Sunada 1977).

Using the representative values for dry density, total porosity, and effective porosity of clays and silts, the theoretical moisture content by weight for the Minford at 100 percent saturation (i.e., all void space filled with water) ranges from 24.7 to 27.3 percent ($M\%_{SATWT}$). Based on 1,205 data points across PORTS, including background, the average moisture content by weight of the Minford vadose zone (0 to 10 ft below ground surface [bgs]) is 16.4 percent ($M\%_{AVGMinford}$). Therefore, on average, the Minford is at 60.1 to 66.4 percent (pore) saturation. Assuming that all available water within the effective porosity zone (clays = 0.06) is drained while maintaining the clay-bound pore zone at full hydration, the resultant "dry/drained" moisture content ($M\%_{DRYWT}$) would be 22.0 to 24.5 percent with a (pore) saturation level of 88.9 to 89.9 percent. At this effective porosity (0.06), the Minford vadose zone would already be considered "dry" and nearly impossible to dewater in a short duration by gravitational means alone. If an effective porosity of 0.20 (for silts) is considered, the "dry/drained" moisture content would range from 14.7 to 17.2 percent and the saturation level would be 59.4 to 63.2 percent.

Where there are pockets of clean silt, the free liquid will be able to drain out. However, the addition of relatively small amounts of clay will reduce the ability of the clayey silts to drain. Again, little to no benefit would be realized by gravitational draining of the Minford vadose zone at an average moisture content ($M\%_{AVGMinford}$) of 16.4 percent.

In addition to the relatively high moisture content (i.e., close to 60 to 66 percent saturation) in Minford clay in the vadose zone and difficulties in previous soil treatment efforts, the high TCE PHC concentrations measured under X-720 building (Figure E.5) above the groundwater table further demonstrate that Minford clay does not release moisture and associated contaminations by gravity drain effectively. Significant amounts of TCE stay in the vadose zone clay even long after the sources of TCE were removed from inside the X-720.

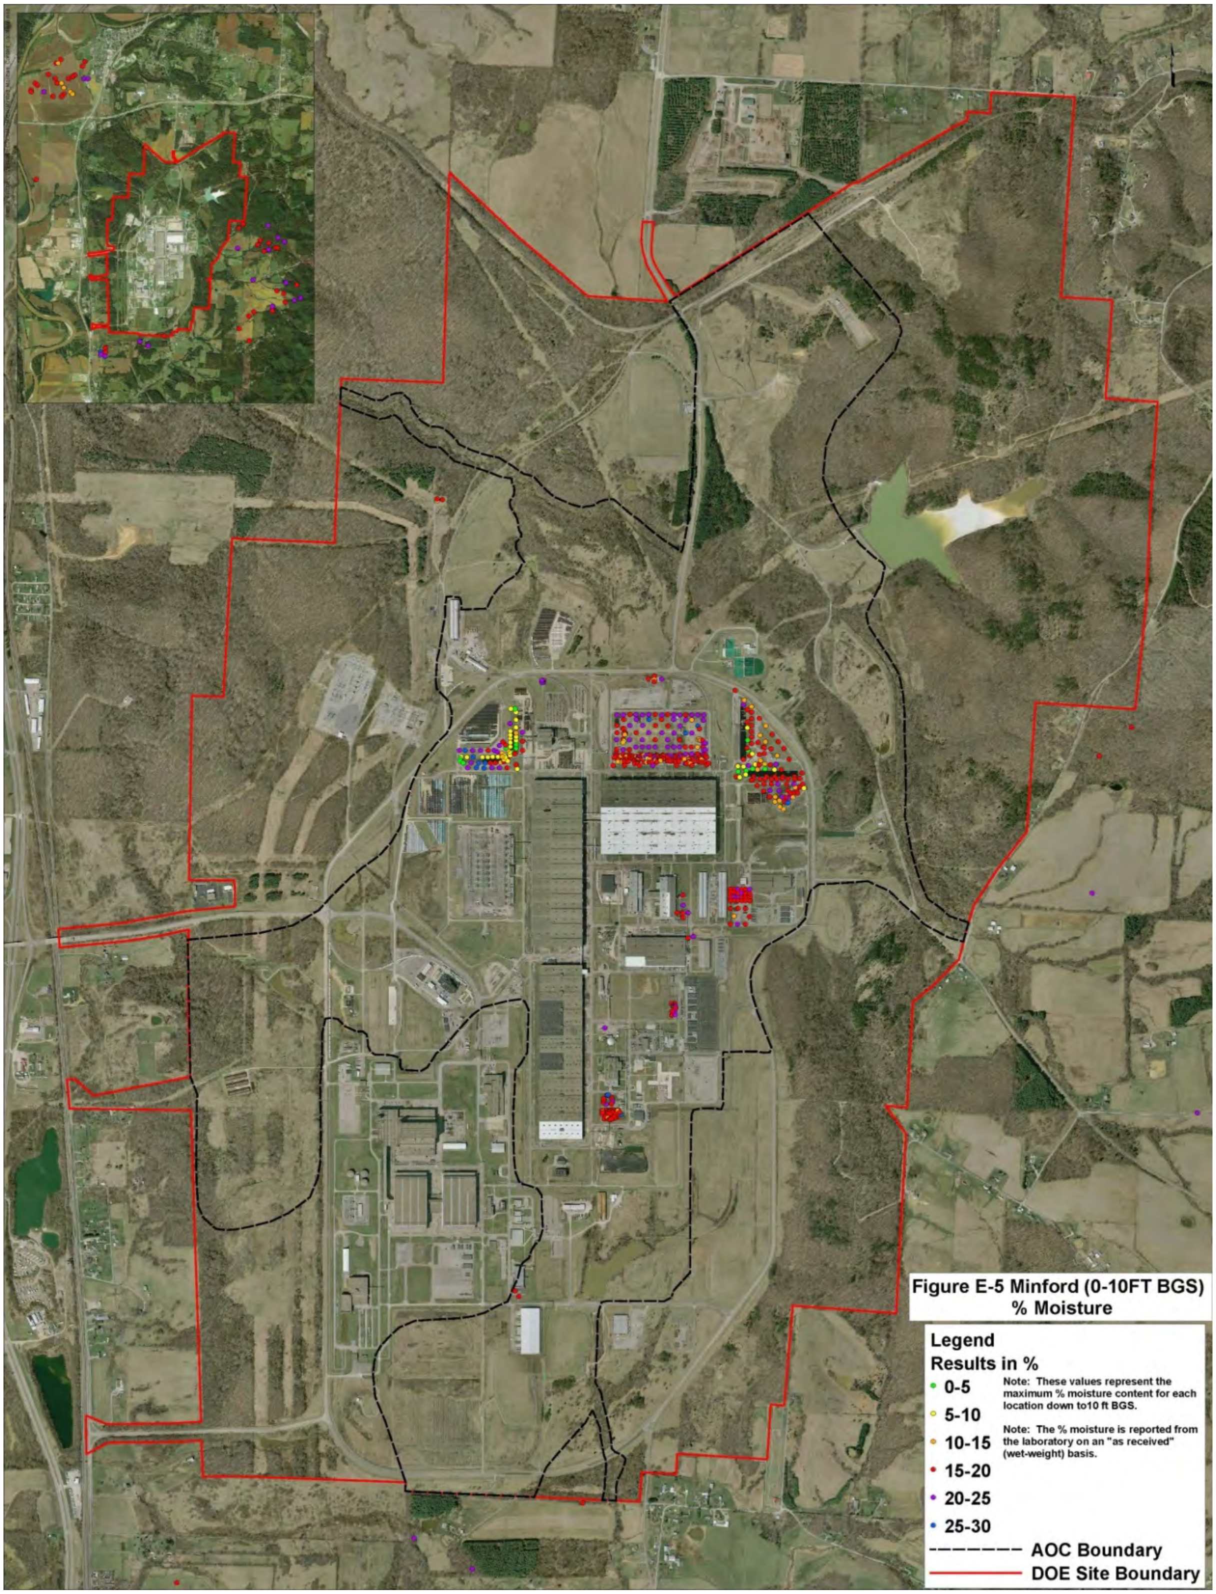

Figure E.5. Minford Percent Moisture at 0 to 10 ft below ground surface

E.2.1.2 Gallia Sand and Gravel

The Gallia averages 3 to 4 ft in thickness at PORTS and is characterized by poorly sorted, silty, clayey medium to coarse sand or gravel with the primary constituent varying between sand and gravel. A former study (Law Engineering 1978) indicated that the Gallia had an average clay content of 30 percent. The combination of post-Gallia erosion and modern stream deposition over already variable Gallia thickness has resulted in irregular thicknesses across the site.

Based on site geology, the Gallia could be described as a clay loam to loam to sandy clay loam. The typical dry density values for these soil types are 1.28 g/cm^3, 1.36 g/cm^3, and 1.44 g/cm^3 (sandy loam), respectively (Linsley et al. 1982; Poffijn 1988). In general, total porosity values for unconsolidated materials lie in the range of 0.25 to 0.70. Coarse-textured soils such as gravel and sand tend to have a lower total porosity than fine-textured soils such as silts and clays. As a comparison, the typical total porosity ranges for (coarse) sand are 0.25 to 0.50 (Freeze and Cherry 1979) and 0.31 to 0.46 with an arithmetic mean of 0.39 (McWorter and Sunada 1977), whereas the total porosity of clays are 0.40 to 0.70 (Freeze and Cherry 1979) and 0.34 to 0.57 with an arithmetic mean of 0.42 (McWorter and Sunada 1977). Soil analysis of a sample from PORTS (proposed X-737 site) of the Gallia member indicated the porosity at 37.9 percent (Ogden Environmental and Energy Services 1994). The typical effective porosity of (coarse) sand ranges from 0.18 to 0.43 with an arithmetic mean of 0.30, whereas the effective porosity of silts ranges from 0.01 to 0.39 with an arithmetic mean of 0.20. An effective porosity of 0.30 is normally used to characterize hydrogeological properties of the Gallia at PORTS.

Using the site-specific Gallia values for dry density and effective porosity and representative values for total porosity of various soil types, the theoretical moisture content by weight for the Gallia at 100 percent saturation (i.e., all void space filled with water) ranges from 20.8 to 24.7 percent ($M\%_{SATWT}$). Based on 237 data points for the Gallia, the average moisture content by weight of the Gallia is 17.6 percent ($M\%_{AVGGallia}$). Therefore, on average, the Gallia is approximately at 71.2 to 84.5 percent (pore) saturation. Assuming that all available water within the effective porosity zone (Gallia = 0.30) is drained, the resultant “dry/drained” moisture content ($M\%_{DRYWT}$) would be 5.2 to 8.6 percent with a (pore) saturation level of 25.0 to 34.7 percent. If an effective porosity of 0.20 (for silts) is considered, the “dry/drained” moisture content would range from 11.1 to 14.7 percent and the saturation level would be 53.1 to 59.4 percent. Therefore, some benefit could be realized by gravitational draining of the Gallia zone at an average moisture content ($M\%_{AVGGallia}$) of 17.6 percent.

E.2.2 PROPOSED ADJUSTED STANDARD

Considering the observed physical characteristics of known soil with TCE PHC or potential soil with TCE as a PHC, the estimated efforts required and short-term impacts and/or risks to workers to achieve (E)(4)(d) standard site wide, and the robust OSDC design (see the Intermediate Design Package), an adjusted treatment standard under (E)(4)(e) for TCE PHC in soil at PORTS is justified, if contaminated soil is to be excavated, field dewatered, and then used as engineered fill in the potential OSDC. Alternative 2 will require substantial amounts of soil that will be used as fill material. Fill material is critical to the management of wastes in the potential OSDC because it is used to structurally support D&D wastes and provide a buffer to protect the liner that contains leachate that will be generated. On-site borrow soil consisting of contaminated residual soils andaquifer materials has an added benefit of remediating contaminated soils that would serve as source for continued groundwater contamination and impact future use of the site. Other alternatives would still offer containment of contaminated groundwater but source areas containing TCE DNAPL do not have to be removed to accomplish these goals. Therefore the use of residual soil as fill and, potentially, highly contaminated aquifer material, offers an opportunity to significantly enhance the scope of remediation and benefit the site for future use.

However, this comes at a cost in time and money, if soils must be treated to the treatment standard of 500 mg/kg as demonstrated in Appendix E.

An adjusted standard for TCE PHC soil of: (1) excavating, field dewatering to no free liquid, and (2) limiting the remaining representative TCE concentration to less than 5,000 mg/kg is proposed. This adjusted standard satisfies multiple factors listed in *OAC* 3745-57-72(E)(4)(e) to be considered by the Ohio EPA Director. If approved, this adjusted standard would ensure that the contaminated fill option for the potential OSDC under the Alternative 2 could be implemented safely and cost effectively.

In order to achieve the proposed adjusted treatment standard, temporary storage and treatment CAMUs under *OAC* 3745-57-72 (C) and (F) may need to be constructed close to major excavation sites for conducting additional dewatering or other treatment operations, if sufficient dewatering could not be achieved at the excavation sites or the remaining TCE concentrations are higher than 5,000 mg/kg for certain soil types. As demonstrated in subsequent sections in this appendix, these soils will mainly consist of the high-clay content Minford Formation. Gravity drainage of these soils can occur, but may take years to reach the water content that is adequate to be used as fill. However, the treatment and storage CAMU operation will consolidate soils with varying properties including clay and water content. The act of consolidation has a beneficial effect of treating soils by mixing and also breaking the soils apart to facilitate better drainage and capture of contaminated water and potentially DNAPL. Other treatment technologies can be attempted if characterization of these consolidated soils proves that the treatment was ineffective. These technologies if necessary will be identified in future area-specific design documents for excavation and corresponding requests for designation of treatment and storage CAMUs. Therefore, soil may also be further treated in these CAMUs to lower remaining TCE concentrations to below 5,000 mg/kg or be packaged for off-Site shipment, if necessary. Currently, DOE does not plan to stage or treat bulk contaminated soil at the Impacted Material Transfer Area (IMTA) by the potential OSDC, although it will also be constructed and designated as a CAMU for staging primarily D&D waste as explained on Page 18 of the main text.

E.2.2.1 TCE Levels Protective of Geomembrane Liners

The proposed 5,000 mg/kg ceiling concentration is only about one third to one half of theoretical conditions indicating presence of TCE free product in Minford type of clay soils. Consequently, the treatment of residual soils, and other contaminated soils, will assure that no DNAPL is placed in the potential OSDC. Therefore by applying this limit as a safeguard would ensure that the liner materials will not be exposed to excessive TCE free product if the volume of TCE contaminated soil that is anticipated is used as engineered fill in the potential OSDC.

E.2.2.2 Dewatering To No Free Liquid and Separation of TCE-Free Product

At a minimum for saturated soils, soils containing TCE PHC will need to be dewatered to remove free liquid like any other material prior to placement or disposal in the potential OSDC. TCE-free product must be separated from the collected free liquid and properly handled and disposed of off Site. If the soils do not have free liquid, there would be no need for dewatering. However, by breaking up the in situ soil structure, the excavation process will facilitate reduction of moisture content, free up potentially trapped TCE free product from both saturated and unsaturated soils, and prepare the excavated soils for characterization, transportation to, and subsequent placement in the potential OSDC. DOE is contemplating that by consolidating and potentially amending contaminated unsaturated soils treatment will also be affected. This is necessary because of the geotechnical requirements for moisture content that is necessary for placement in the potential OSDC.

In accordance with *OAC* 3745-57-72(A)(3)(a), the placement of bulk or non-containerized liquid hazardous waste or free liquids contained in hazardous waste (whether or not sorbents have been added) in any CAMU is prohibited except where placement of such wastes facilitates the remedy selected for the waste. The dewatering effort will be conducted first in situ during excavation by gravity drain. Sufficient run on controls will be implemented around the excavation areas. Groundwater may also be pumped around the deeper excavation areas to lower groundwater table during the full duration of excavation. Water that is collected during these activities will be treated in one of the existing groundwater treatment facilities that are designed to handle TCE. If necessary, soil dewatered in the AOC may require additional treatment in a storage and treatment CAMU near the excavation site.

TCE concentrations in Gallia soil may be reduced to some degree by gravity drain, if no TCE-free product is present at the location. Significant reduction of TCE concentrations in Gallia soil could be expected, if free product is present initially at the location. Reduction of TCE concentrations in excavated Minford clay from vadose zone is not expected. As shown in Figure D.3, about 450 cy of soil may still have TCE concentrations over 5,000 mg/kg (the level considered conservatively protective of the liner) after dewatering. After excavation and dewatering, the remaining levels of TCE in Minford clay soil are estimated to be, on the average, over 5,000 mg/kg, but could be as high as 15,000 mg/kg (see Figure E.4) in some of the most significant TCE source areas at PORTS, primarily those areas associated with facilities that stored and/or used large quantity of TCE for many decades such as Building X-720. Therefore, additional steps may be required in these areas to achieve the proposed ceiling of 5,000 mg/kg following any required field dewatering and a best-effort to separate TCE-free product from the excavated soil. These steps may include additional treatment or shipping the soil off Site for disposal.

Additional soil with concentrations over 5,000 mg/kg may need to be excavated from the top weathered portion of the Sunbury formation underlying the Gallia soil in the X-701B area, where significant amount of TCE-free product may be present. It is DOE's desire to remove as much TCE-free product from this formation as practical during soil excavation, in order to shorten remaining groundwater remediation durations after soil excavation in this area. Therefore, dewatering and additional treatment of the excavated Sunbury shale would also likely be required.

E.2.2.3 Regulatory Justifications

The following section is a summary of the regulatory justifications that are presented in the main text of this Supplement. The proposed adjusted standard for TCE PHC soil of (1) excavating, dewatering soil to no free liquid and (2) a ceiling limit for representative TCE concentration of 5,000 mg/kg satisfies multiple factors listed in *OAC* 3745-57-72(E)(4)(e) to be considered by Ohio EPA Director. Most importantly, the proposed adjusted standard is more protective of human health and the environment than the (E)(4)(d) standard because a shorter remedial duration and a more complete soil remediation can be accomplished in parallel with the D&D activities at PORTS.

a) Support D&D and waste placement (E)(4)(e)(i)

As pointed out in Section E.1.5 of this appendix, the (E)(4)(d) standard is impractical to support the D&D waste placement in the potential OSDC due to the required treatment duration and associated high cost. Implementation of the proposed adjusted standard, on the other hand, will be able to support the D&D project at PORTS with normal soil excavation equipment and processes used in large-scale soil remediation without significant delays.

b) Reduced short-term risk to workers (E)(4)(e)(iv)

This adjusted standard will result in no extra chemical or radiological exposures experienced by the field workers as opposed to the lengthy soil treatment processes necessary to achieve the standard under

(E)(4)(d). The proposed adjusted standard under (E)(4)(e) will only require soil excavation, dewatering, characterization, and transportation activities normally conducted in a large scale soil remediation. Only a manageable amount of contaminated soil may require further treatment and/or be disposed of off Site.

c) Accelerated cleanup and protective end state (E)(4)(e)(iii)

The estimated volume of contaminated soil that may require additional thermal and/or chemical treatment is reduced from 29,000 cy to 450 cy or less. The savings in cost and time are very significant (i.e., close to $10 million and 2 years). The savings will be used to accelerate more D&D activities and shorten the overall project duration at PORTS. That will better protect the workers, the public, and the environment from potential short-term impacts. This is consistent with the views of the affected local community toward an accelerated cleanup to achieve a protective end state and reuse of the land at PORTS.

d) OSDC protectiveness (E)(4)(e)(v)(*b*)

If selected, the OSDC will provide long-term protection by constructing the CAMU at a location with the best geological conditions at PORTS and will exceed all regulatory engineering design requirements, including double liners and leachate collection requirements for a normal RCRA hazardous waste landfill. Waste acceptance criteria-compliant D&D wastes and fill will be placed in a very controlled manner to ensure long-term stability of the entire waste layer and the final cover system. The OSDC is required to be protective for 1,000 years by the DFF&O.

Applying the 5,000 mg/kg ceiling limit after dewatering as an adjusted treatment standard for TCE contaminated soil in all three major TCE PHC areas in the zone of reasonable treatment values (see Figure D.3), instead of the treatment standard of 500 mg/kg will reduce the amount of soil potentially needing further treatment to a more manageable quantity. This will facilitate a more thorough soil remediation of remaining TCE source areas in groundwater plumes at PORTS. Consequently, the groundwater remediation will be significantly accelerated as a result of removal of all significant TCE sources and DNAPL. This adjusted treatment standard will also allow the pace of soil characterization, excavation, and processing from these areas to keep up with the expected building waste placement rate in the potential OSDC by reducing the time required for characterization and treatment of TCE PHC soil. Following the proposed adjusted treatment standard, the contaminated soil could be processed, placed, and contained within the robust OSDC and safely isolated from the environment.

E.3 SUMMARY

The requirements of *OAC* 3745-57-72 were followed to propose an adjusted treatment standard for TCE PHC contaminated soils to be excavated during D&D and soil remediation at PORTS as identified in Appendix D. After evaluating all the available soil data and the limitations associated with historical soil treatment efforts collected or conducted in the last 20 plus years at PORTS, a protective and cost-effective adjusted standard under (E)(4)(e) is proposed. When all factors are considered, and after cost-effective treatment (i.e., excavation and dewatering), the soil waste will be placed in a disposal CAMU that is protective of human health and the environment.

The proposed adjusted standard for TCE PHC contaminated soil, considered as an option for engineered fill in the potential OSDC under Alternative 2, of: (1) excavating, dewatering to no free liquid, and (2) a ceiling limit for remaining representative TCE concentration of 5,000 mg/kg satisfies multiple factors listed in *OAC* 3745-57-72(E)(4)(e) to be considered by the Ohio EPA Director. The proposed adjusted standard is protective of the public and the environment under the *OAC* 3745-57-72(E)(4)(d) standard. As an added benefit, it will support an accelerated overall cleanup mission at PORTS. This conclusion is valid for both the residual soils and soils produced under other regulatory authorities with TCE as a PHC because the determining factors are the robustness of the potential OSDC design and physical properties of the Minford clay soil, both of which are independent of the label of residual soil versus other soils.
